In 1909 the Werkbund's interest in objects for a wider market was reflected by Riemerschmid and Bertsche's development of Typenmöbel furniture in Munich, whose interchangeability of parts allowed 800 different permutations and combinations. Manufactured in large quantities and therefore relatively cheap, the furniture nevertheless had an individuality and character of its own, without betraying the use of machinery in its production. In comparing the chairs in Karl Bersch's study, executed by the Deutsche Werkstätten für Handwerkskunst at Dresden-Hellerau in 1909–12 and those by Behrens in Darmstadt in 1901, it is difficult to guess which one had been machine-made. Although most Werkbund designers acknowledged the effectiveness of both the machine and hand tools in achieving quality, their interiors reveal that an insistent bias towards craft remained. The work from Karl Schmidt's Dresdener Werkstätten shows this clearly. Paul Schultz-Naumburg was typical of the majority of leading designers who chose to eschew advanced theory in favour of a more conservative position. He encouraged continuity through the adaptation of earlier styles to suit modern conditions. His bedroom, executed by the Saalecker Werkstätten, contained Biedermeier and Neo-Classical elements, especially in the couch, table, light fittings and heavily draped windows. Fischer and Riemerschmid also sought continuity, but they drew their inspiration from regional craft traditions.

The architecture of the 1914 Cologne Werkbund Exhibition exposed a polarisation between sober classicism and imaginative individualism. Interior design also showed that formal unity, so important to the cultural reform movement, remained elusive. Hoffmann's room, with its Regency stripes and strangely mannered chairs, showed the refinement of the Wiener Werkstätte giving way to a fussiness verging on the decadent. The interior of Muthesius's pavilion for the Hamburg-America shipping line proved that while his theories were advanced, his practical designs tended towards Neo-Classicism, so popular since the turn of the century. In contrast to the curving organic lines of the exterior of van de Velde's Werkbund Theatre, the foyer and interior theatre remained largely based on rectangular constructional features while his design for a living room, with its Art Nouveau chairs and carpet, presented a mixture of styles. Gropius's Hall, designed for Hermann Gerson of Berlin, appeared heavy and conventional and curiously at odds with the transparent clarity and daring fenestration of his Model Factory, constructed at Cologne. A wide range of historical and regional forms were evident. Behrens displayed Neo-Classical furnishings for the German Embassy in Leningrad and Paul Ludwig Troost showed his Neo-Baroque style dining room for the Bremen-Oldenburg House. Lucien Bernhard designed an Empire style bed for a luxurious room by the Deutsche Werkstätten. Runge and Scotland's room was decorated with heavily patterned wallpaper, carpet and fabrics and included marble-topped tables and carved chairs. This richness was echoed in the

Deutscher Werkbund: community room in block of flats by Walter Gropius, with tubular steel furniture by Marcel Breuer, Berlin, 1931

heavily upholstered furniture and patterned décor of the Summerhouses by Max Heindrich and Berhard Stadlet. Wilhelm Lossow and Max Kuhne sought to invest the Saxon House with regional identity by using local craftsmen to create wrought-iron gates and screens. While the exhibits manifested divergences in practice, the annual conference debated the underlying theoretical tensions, namely the relative importance of individual design (supported by van de Velde) and *Typisierung* (or standardisation of good form and good taste), supported by Muthesius.

A change of direction was evident in the 1920s when, responding to the circumstances of post-war Germany, the Werkbund concerned itself more closely with social needs and contributed to a number of rebuilding schemes. In 1927 they organised the Weissenhof Seidlung Exhibition in Stuttgart where, under the supervision of Mies van der Rohe, Modernist architects and designers tackled the problem of mass-housing and in so doing revealed their desires for humanity and their belief in a broader vision of the new social order. Mart Stam's 1925 cantilever tubular steel chair with leather seat and back

rest was shown with Mies's own *Weissenhof* cantilever chair in wicker and tubular steel. Similar Werkbund exhibitions followed in Breslau in 1929 and Vienna in 1932. Gropius's Weissenhof house included tubular metal beds by Le Corbusier and Alfred Roth, that could be folded away during the day. However, not all chair design in the 1920s made use of dramatically new materials, and, in comparison to wood, metal was expensive. The Rasch Brothers therefore used steamed and moulded plywood, which was in every way as significant as tubular steel – providing an all-plywood suite for one of Mies's flats at Weissenhof. Adolf Schneck in Stuttgart and Ferdinand Kramer in Frankfurt, while showing a clear understanding of the International Style, adopted a less dogmatic attitude to revolutionary materials. Using composite boards, faced with veneer or painted in brightly coloured enamel, their furniture was precise in constructional and technical details and therefore “modern” in appearance. It could be dismantled and readily assembled for easy transportation. Schneck illustrated a room in *Wie Wöhen?* published by Der Eiserne Hammer (1929): this influential book, brought together a collection of

reasonably priced furniture for the low income householder, emphasising cheap and simple arrangements.

Other interiors by Marcel Breuer and Walter Gropius reflect the aesthetics and philosophy of the International Style and in their communal rooms for a ten-storey apartment block (Werkbund Exhibition, Paris, 1931, and Deutsche Bauausstellung, Berlin, 1931), they endeavoured to realise their ideal of how people might live in a new society in which leisure facilities and swimming pools might be shared. Another important area of Werkbund reform during this period was in the design and equipping of kitchens, especially those designed by Grete Schutte-Lihotsky and Ernst May for the massive rehousing schemes undertaken in Frankfurt in the early 1930s. However, with the advent of the Third Reich, the Werkbund split into opposing factions. Its more conservative members sought an accommodation with the Nazis which was fiercely opposed by Gropius and his ex-Bauhaus associates Wilhelm Wagenfeld and Martin Wagner and in 1934 the Werkbund was formally dissolved. It was revived again in 1947, since when it has been responsible for the design of several important buildings and displays, notably the German Pavilion at the Brussels Exposition Universelle in 1958. Eschewing unjustified criticism of superficiality and narrowness of approach, its longstanding promotion of simplicity and clarity in design was successful in permanently changing the appearance of the average domestic interior. Greatly admired in other countries as an efficient promoter of good industrial design, the Werkbund formed the model for other similar organisations in Austria (1910), Switzerland (1913), Sweden (1910–17), and the Design and Industries Association in Britain (1915).

de Wolfe, Elsie 1865–1950

American interior decorator

Elsie de Wolfe was a pioneer of the profession of interior decoration in America. For almost half a century her rooms were copied and her pronouncements repeated in the magazines that shaped popular taste across the country. Her combination of antique furniture, modern colours and convenience, encompassed in her design philosophy – Simplicity, Suitability and Proportion – remains one of the most popular styles of decorating today.

In 1895, the magazine *The Outlook* published an article by Candace Wheeler entitled "Interior Decoration as a Profession for Women". In 1897, the Hewitt sisters, friends of de Wolfe, launched their museum of decorative arts and design, the Cooper-Hewitt, which inspired contemporary designers. In the same year, Edith Wharton and Ogden Codman published *The Decoration of Houses*, in which they equated natural good taste with English, Italian and French models from the Renaissance onwards, but particularly 18th-century French, and urged a rejection of contemporary revivalism. The book advocated interiors in which proportion, architectural unity, and propriety were emphasised. Renaissance and Neo-Classical furniture and architecture provided the preferred vocabulary. Wharton and Codman's ideas greatly influenced de Wolfe, whose early travels in France were to lead to a life-long passion for the country and a considerable knowledge of its decorative arts. She modified them in her work as a writer and interior decorator to produce interiors of clarity, simplicity and lightness which were markedly different from those of the Victorian era, and which were well-suited to the burgeoning aspirations, confidence and success of North America, both economically and industrially.

De Wolfe's first decorating project was in 1897 with the decoration of the house that she shared with the wealthy theatrical agent Elizabeth Marbury in Irving Place, New York. De Wolfe revitalised the interior by stripping away the Victorian features. In the dining room the wainscoting, the corner doors, the ceiling mouldings and the bases and tops of the other mouldings were all painted white, which later became a de Wolfe trademark. The hanging chandelier, the Delft plates, the tapestries and the grandfather clock all vanished. The scatter of small oriental rugs gave way to a single plain carpet. New dining chairs with painted frames and transparent cane backs, from France, replaced the heavy oak pieces with cut velvet seats. Clever use of mirrors, over the fireplace and behind the wall sconces, another frequently used de

de Wolfe: Colony Club, New York, trellised tearoom, 1913

Wolfe device, lightened the room further. The transformation of Irving House from cluttered interiors typical of contemporary American taste to scenes of elegance and airiness, coincided with the emergence of de Wolfe and Marbury as significant figures in New York high society. The house was seen by a stream of important visitors and they were impressed.

In 1904 de Wolfe left an unsuccessful career on the stage where she had attracted little acclaim for her acting but plenty for her dress sense and elegance, to launch herself as a decorator. In 1905 Stanford White, the leading New York Beaux-Arts architect, secured for her the contract to decorate the city's new Colony Club, open only to women. This was the first time a public interior had been designed by a professional decorator and not an architect or antique dealer. De Wolfe rejected both the current fashion for 18th century American Colonial and the taste for the Neo-Classical revival that followed the Chicago World Columbian Exposition of 1893. Instead she was inspired by the elegant interiors she had seen in English country houses that she had visited in the 1880s. Walls were painted soft, pale colours, antique furniture acquired from England and France was light, comfortable, undistracting and easily moved if required for a special event. Large print chintzes, another popular de Wolfe adaptation, were brought

from England for the bedrooms. The tea room was decorated as a conservatory with green painted trellis work, tiled floor and wicker furniture. Her scheme was a success; she became famous as the "Chintz lady" and further commissions followed.

In 1909 she hit upon the idea of a show house that would demonstrate her style of decoration, create some publicity and earn some money. With Ogden Codman as collaborator, she tore apart and rebuilt a New York brownstone on East 71st Street, and transformed it. Since brownstones were still the most common and characteristic style of New York house, de Wolfe and Codman's work attracted great interest and before long they were kept fully employed by owners of other brownstones who wanted similar transformations.

By 1911, de Wolfe was established as one of the most influential tastemakers in the country. In 1913, she received a commission from the multi-millionaire art collector, Henry Clay Frick. Frick had been impressed by the display of 18th-century French fine and decorative art that had been recently bequeathed as the Wallace Collection in London. Having decided to found a similar institution in America he commissioned the architectural firm of Carrere and Hastings to design a Renaissance palace on Fifth Avenue to house the collection of

18th-century French paintings and furnishings which he formed with the advice of the English dealer Joseph Duveen. William Allom, Duveen's decorator, was responsible for the public areas on the ground floor, but Frick commissioned de Wolfe to decorate and furnish the private family rooms on the first floor. She worked for a ten per cent commission of costs, and it is said that these totalled between one and three million dollars. This commission took de Wolfe into a new league both financially and professionally, and she went on to decorate numerous interiors for America's wealthy families.

Increasingly, de Wolfe left the running of the New York business to associates and employees (the company filed for bankruptcy in 1937) while she herself concentrated on a select group of individual clients. Among these was the publisher Condé Nast who employed her throughout the 1920s in New York, and Paul Louis Weiller, the aircraft manufacturer, in France. In 1936, she was asked by King Edward VIII to advise on the redecoration of Buckingham Palace, but this project was abandoned after the king's abdication. She remained friends with the exiled Duke and Duchess of Windsor, however, and in 1938 she helped the Duchess of Windsor redecorate Château de la Croë on Cap d'Antibes in the South of France.

De Wolfe established a working pattern for subsequent interior decorators to follow. She travelled extensively in Europe to gather antique furniture and fabrics. She wrote articles and books and carried out commissions. From the 1890s she had a home in France in Versailles, at the Villa Trianon; she died there in 1950. Always deeply attached to France, she received the Croix de Guerre, and the Légion d'Honneur for her work in World War I. Her taste for "old French" set a standard. A group of professional decorators emerged during the 1920s and 1930s, in America and England, eager to emulate her success. Ruby Ross Wood (1880–1950) who began her professional life as a journalist, ghost-writing de Wolfe's magazine articles that became the book *The House in Good Taste* in 1913, went into the business herself, establishing her own highly successful decorating firm in the 1920s. Nancy McClelland and "Sister" Parish were also clearly inspired by her and Syrie Maugham (1879–1955) and Lady Sybil Colefax (1875–1950) were among her English followers.

De Wolfe pioneered the eclecticism that still characterises much interior decoration today, using contemporary art in traditional settings, and, even quite late in her life, introducing new and unexpected materials: plastic and glass, fur throws, leopard and zebra prints. What she discovered was not a new style but a new sense of the way a house should function – a synthesis of comfort, practicality, and tradition that was in tune with the new century. She used familiar materials to forge something original, a combination of antique elegance and modern convenience that would be known for decades as the Elsie de Wolfe look. Today the American Society of Interior Designers still calls its annual prize for interior design the Elsie de Wolfe Award.

Biography

Born in New York in 1865. Attended school in New York; lived in England, 1879–86. Returned to New York in 1886 and employed as

an actress by Charles Frohman. Several stage successes during the 1890s; retired from the theatre in 1904. Established herself in New York as an interior decorator in 1905 and executed many commissions over the next 30 years; interior decorating business declared bankrupt in 1937. Published several articles on interior decoration which appeared as *The House in Good Taste*, 1913. Volunteer nurse in France, 1916–18; awarded the Croix de Guerre, and the Légion d'Honneur. Shared homes in New York and Paris with the theatrical agent, Elizabeth Marbury from 1892 to early 1920s; married Sir Charles Mendl in 1926 and lived mainly in France until 1940; lived in Beverly Hills, California, 1940–44; returned to Paris in 1946. Died in Paris, 12 July 1950.

Dining Rooms and Eating Rooms

Compared to some of the other rooms within the house dining rooms have a relatively short history. The term itself did not acquire its modern meaning until the second half of the 17th century and was not generally accepted until well into the 18th century. Prior to this it was not usual to set aside a room solely for eating, even in wealthy homes. In medieval hall houses the family ate their meals along with their servants in the great hall using trestle tables and benches that could be cleared away to free the room for other uses. It was also usual during this period for the family to sit at a separate table, placed on a dais at one end if they were particularly grand. From the 14th century, a greater desire for privacy emerged, and separate family rooms were created behind the screen of the great hall; two living rooms on the ground floor and a sleeping apartment above. The family then ate in one of the living rooms, known as the parlour, but they continued to use portable furniture until the 16th century.

Wealthy households also required a larger room for more ceremonial meals during the 16th century since entertaining large numbers of guests was regarded as an important sign of rank during this period. Long dining tables were used, with guests seated in a strict order according to their position within the social hierarchy and meals consisted of numerous courses and lasted anything up to five hours. But by the 17th century society was becoming more exclusive. It was no longer regarded as a mark of favour to be entertained in as large a company as possible, and dining was on a smaller and more intimate scale, although mealtimes themselves were still quite formal occasions and were subject to numerous conventions and rules. This period also saw the development, particularly in England and Holland, of heavy pieces of furniture connected with dining that could not easily be moved from one room to another. These pieces included massive oak buffets, heavy draw-leaf tables, and built-in buffets and shelves.

The buffet originated in the open shelves that had previously been used to support the plate and wine and became a vast piece of furniture consisting of an enclosed section or cupboard below and stepped shelves above. At meal times the top of the cupboard was covered with a linen cloth and wine and plate were displayed; during other parts of the day these were cleared away and the surface was left bare. The table was equally massive and was solidly constructed from thick planks of wood supported on heavily carved legs. For the first half of the century, it was usual to protect the surface with a table carpet (generally of Turkish origin) and a white linen cloth was laid on top at mealtimes. Rectangular draw-leaf tables, which allowed the head of the household, or a guest of higher rank, to sit at the head of the table with a more elaborate chair, were also common during this period. By the late 17th century, however, circular or oval gate-leg tables with falling leaves were preferred, particularly in England and Holland. These could be folded down and taken away or placed against the wall when not in use. By this time too, the buffet had fallen from favour and was replaced in the early 18th century by more elegant sideboards that often had a top made out of marble or some other material that was easy to wipe clean.

The introduction of large permanent items of furniture encouraged the emergence of separate dining rooms as places

that were used exclusively for eating and such rooms began to appear from the late 17th century. But it is important to stress that throughout this period dining rooms might still sometimes be used for other purposes and also that meals were frequently taken on small tables set up in other rooms.

While Great Chambers and halls were often hung with tapestries, panelling and gilt leather hangings were preferred for early dining rooms as these did not retain the smell of food. In grand houses panelled walls might also be hung with family portraits. In 1690, Celia Fiennes described the dining room at Lowther Castle as being wainscoted in oak, while the dining room at Chippenham Park had three windows with a looking glass on each pier, set into the wainscot. In houses of this kind, a Great Dining Room was one of the principal rooms and occupied a central position within the house. Ceremonial dinners involved the use of side tables from which the servants served the food and wine. But when the family dined alone meals were taken in the common eating room or dining parlour.

The Marble Dining Room at Ham House, Twickenham, represents one of the earliest uses of the term in England. Added in 1675, it occupied a central position on the ground floor and was flanked by the Duke and Duchess of Lauderdale's apartments. It had a black and white marble floor in the Dutch manner and gilt leather hangings. The furnishings included three oval tables, 18 walnut chairs and two cedar side-tables with marble tops that were placed in recesses either side of the main door. Such rooms were becoming increasingly common in new houses during the early 18th century and by the 1720s even town houses in the provinces sometimes included dining rooms. This development is indicative of the general move towards rooms with more specific uses and away from the multi-purpose rooms that had prevailed before. An early example of such increased specificity is Sir Robert Walpole's house, Houghton (from 1726), which even included a breakfast room and supper room as well as a splendidly appointed dining room on the *piano nobile* that was designed by William Kent.

The 18th-century English practice of decorating the main public areas, including the dining room, as a suite of rooms did not apply in France. Although by the early 18th century the *salon* had become the *salle à manger* for formal dinners and banquets in the larger houses in France, most meals were taken in an anteroom. Robert Adam, in the *Works in Architecture*, 1773–79, explains that this difference between England and France was due to the different amounts of time spent on dining; in England dining, and more particularly drinking after the meal, was a protracted affair and therefore the decoration of the room was important, whereas in France the company soon removed to another apartment.

Parquet floors became fashionable in the mid 18th century; the dining room at Ham House had its marble floor replaced with one of parquetry c.1756. But as the century progressed and floor carpets became more widespread, Turkey or mock turkey Wilton carpets began to be used for the centre of the room. The introduction of Rococo styles meant that stucco and plasterwork decoration replaced wood panelling, and the decoration was applied to form a series of vertical panels, painted white or a pale colour. Dining rooms were also increasingly used as a place in which to hang paintings, with sporting

Dining Rooms: *Our Dining Room in York*, watercolour by Mary Ellen Best, 1838

themes, portraits and still-lives proving especially popular. Paintings were commonly hung within the fields of plaster-work panels but another variation was Robert Adam's treatment of the Dining Room at Osterley (c.1766) where the panels themselves were painted with scenes of ruins.

Large tables, or sets of tables as they were called, had become fashionable by around 1780. These enabled larger numbers of people to be entertained and demonstrate the increasing importance placed on dining as a social function. Formality, both in the terms of the way that meals were served and in table manners, was an essential part of the proceedings. (A detailed description of a dinner party in the early 19th century appears in Johanna Schopenhauer's *A Lady Travels*, 1988.) The use of large tables also meant that the room could not be used for anything else, although it was still common for the chairs to be placed against the wall when not in use. By the 19th century they began to be left drawn up to the table, but this was not a fixed rule.

As separate dining rooms became more firmly established there followed an important development in their decoration

and furnishings which was to become prevalent throughout much of Europe and North America during the 19th century. This development was related to the growing tendency to distinguish between the light, feminine character of the drawing room and the sombre, more masculine tone of the dining room. Within this context, dining rooms were increasingly furnished with heavier, more robust styles of furniture, usually made of dark woods such as mahogany. Sideboards often had pedestals at either end, with urns which contained water and the drawer below was lined with lead so that wine glasses could be rinsed. Chair seats were frequently covered in leather, with red being the favoured colour. Curtains were usually of woollen cloth and were not as elaborate as the drapery treatments employed in the drawing room, and less use of upholstery generally, at a time when it was becoming more important in other areas of the house, helped make the dining room seem more masculine.

A typical example of an early 19th century middle-class dining room furnished in the "modern" or Greek style appears in Mary Ellen Best's watercolour of her dining room at York

(c.1840). The room has green and white wallpaper with a formal striped pattern. The curtains are red woollen, moreen cloth with a simple fringe, and the chair seats are covered with black horsehair, a cheaper alternative to leather. The table is laid out in the old-fashioned manner which involved serving several courses together. And the floor has a fitted Brussels carpet although it was still common at this date to carpet the centre of the room only and show floorboards around the edge.

The distinction between male and female rooms and styles of decoration extended to most middle-class homes by the mid 19th century and became even more pronounced by the 1860s and 1870s when dining rooms became even more sombre. Colour schemes were rich and dark, and walls were decorated in deep reds and browns and hung with flock wallpapers or imitation embossed leathers. Gothic, Northern Renaissance and Jacobean styles were popular for furnishings which were once again massive, and the room was generally dominated by a large sideboard with deeply carved decoration often incorporating vines and grapes or hunting themes.

By the early 19th century dinner was served between six and seven o'clock and mealtimes became later as the century progressed. Dinner was still, however, a formal occasion requiring a change of clothes, and women retired to the drawing room after the dessert leaving the men to enjoy their port and cigars. During the mid-century a new method of serving food, known as *à la Russe*, which had been taken up by wealthier households some years earlier, became more widespread in middle-class homes. Instead of all the main dishes being arranged on a central table, the dessert was placed down the centre of the table before the meal began while the preceding dishes were brought in one at a time. Each course was served separately, with the food being served to diners by servants who carried the dishes around the table. Whereas previously the tablecloth had been removed for the dessert, it now remained in place throughout the meal, and the presence of the dessert as a decoration led to a great quantity of raised dishes being employed. Another consequence of this new method of serving was that more servants, especially ones who were highly skilled at waiting at table, were required. The ritual of dining became more pronounced and the dinner party became both an important social function and a means of demonstrating wealth and status among the middle and upper classes.

Most middle-class town dwellers in England lived in terraced housing where the rooms were symmetrically arranged above one another over several storeys. There were usually two rooms on each floor. As the kitchen was in the basement, the dining room was on the ground floor, but the drawing room was usually on the floor above. The staircase leading from the ground floor to the first floor played a significant role in the ritual of dining, and its decoration was therefore a matter of some importance. In large country houses arrangements were rarely as convenient. The kitchen was often located in a separate wing, and access to the dining room was through long corridors and passages. This had the practical advantage of taking cooking smells out of the house but it also frequently resulted in the food being cold before it reached the table. Hot plates and warming devices, placed in serving rooms adjacent to the dining room, were introduced in the early 19th

century in an attempt to overcome this problem. Continental city apartments did not have as many separate dining rooms, and anterooms were still often used for dining. A useful comparison of floor plans of flats and houses in London, Paris and Vienna in the 19th century appears in D.J. Olsen's, *The City as a Work of Art*, 1986.

Although the dining room was the only room used for the main meal, food and drink were consumed in other rooms at other times of the day. Large country houses might include a breakfast room for informal meals not just breakfast, and even urban terrace houses sometimes had a breakfast room included in the back extension on the ground floor. Afternoon tea became an important institution from the 1840s; it was taken in the drawing room as were tea and coffee after dinner and sometimes a light supper too.

The formal tendencies in the decoration and use of the dining room continued, though to a lesser degree, into the 20th century. Speculative housing of the 1920s and 1930s always included a separate dining room, although as the numbers of servants decreased, devices such as the serving hatch began to appear. Masculine styles of decoration still prevailed, with Tudor and Elizabethan influenced furniture, often in a dark stained oak, proving popular in the inter-war years.

Although the Modern Movement challenged these notions, it was not until the 1950s and 1960s that the character of the dining room underwent a dramatic change, often ceasing to exist altogether. The dominant influences then came from the US and Scandinavia for open-plan interiors. Dining took place in a dining area or alcove rather than a separate room. Informality was taken a step further in the 1960s and 1970s when the influence of shops such as Habitat promoted the farmhouse kitchen, sometimes with a French influence, using a large, scrub-top table for dining and stripped pine dressers instead of a sideboard. By the 1980s and 1990s there was no longer a strict rule about separate dining rooms; some homes preserve them if formal dinner parties are given frequently, but many do not, and in many contemporary households meals are eaten in front of the television.

Do-It-Yourself (DIY)

"Do-It-Yourself" or – in its abbreviated form – "DIY", emerged as a household expression during the 1950s, and owes its popularity, as a phrase at least, to a movement which developed in America. Recognized on a world-wide basis today as a symbol for the pursuit of home-improvement through self-contribution, DIY unites under its banner an integrated network of manufacturers, publishers, retailers, promoters and consumers.

Any attempt to measure how far this movement as a whole has affected the design of the post-war domestic interior, however, is problematic; for DIY encompasses such a complex web of supply, promotion, sales and individual activities that identification of fixed patterns is virtually impossible. In spite of this, it is evident that since the end of World War II, householders have become more and more involved in the design and construction of their home environment, and it is clear that this contribution to domestic interior design, although difficult to pin down in general terms, deserves due recognition.

In the course of acknowledging the importance of these

ventures, however, a number of questions need answers: why, for instance, has "self-contribution" to the domestic interior become so important to the householder in the post-war years?; whose ideas have "home-improvers" chosen to follow?; and what part has the DIY movement played in moulding a continuum of consumer practices?

A comprehensive building programme, in the immediate post-war period, spread private suburban dwellings across vast tracts of the US, extolling the dream of home-ownership to a receptive public in its wake; and as the economy boomed and full employment returned to America, the dream, for the many citizens who were able to take advantage of the new financial security, turned to reality.

The upheaval and disruption caused by World War II meant that "home", for civilians, ex-servicemen and government officials alike, symbolised security and stability. It is perhaps not surprising, therefore, that householders readily took on the guise of home-makers – increasingly devoting themselves to nurturing and generally "improving" their properties.

New advances in technology, coupled with the introduction of new materials, assisted home-makers in realising their aims. New technology, in fact, was instrumental in contributing to the rise of DIY in a number of ways. Improved technology reduced working hours, for instance, and thus was indirectly responsible for increasing the time which could be devoted to leisure activities. In the process, however, the new automated, push-button world of work also deprived employees of both physical labour and the opportunity of expressing individuality. Americans had traditionally regarded leisure as something that must be earned and "leisure without effort" hinted at idleness, luxury and immorality. Work, on the other hand, was looked on as being something that was morally good. To engage in do-it-yourself, therefore, indicated a fusion of work and leisure, which, within the context of the home environment, helped to satisfy both psychological and physical needs. At home couples could spend their leisure time, as Richard Horn has put it, "... in a purposeful, physically demanding project that [they] initiated and completed" (Horn, 1985).

By far the most direct and significant contribution of the new technological innovations to the home-improver, however, was the introduction (around 1945) of the lightweight portable electric drill. Compact, uncomplicated and convenient, the drill, with its added accessories, surpassed the versatility of any tool that was then available, and, when used in conjunction with such new materials as hardboard, chipboard and Formica, both enhanced and simplified the DIY process for the consumer.

Servicing consumer demand for home repair, construction and decorating equipment was furnished by an industry that transcended mere suppliers. The combined efforts of manufacturers, DIY shops, magazines and exhibitions instigated and promoted a continual flow of new products which were designed to assist the home-improver in tackling mundane and adventurous projects alike. Emulsion paint, for instance, affected decoration – wallpaper could now be painted over or left out of the decorating plan altogether. Adhesive polystyrene, vinyl and ceramic tiles were as "easy as A.B.C. to fix" according to the advertisements, and should the absolute novice ever feel deterred from getting involved in DIY help was at hand in the form of *U-May-Kit* yourself furniture which

not an attempt by the public to follow any fixed philosophy; householders were clearly defining the “modern” interior not so much by what it *was*, but by what it *wasn't* – dark and brown. Doing-it-yourself may not have provided all the answers for those engaged in trying to present a Contemporary or modern look to their homes in the immediate post-war years, nor did it allow householders the privilege of claiming, that “we have arrived”, but it certainly encouraged them to say “we are on our way.”

Perhaps the progressive and golden-age of DIY will remain forever locked in the 1950s and 1960s, for in the eclectic, “mix and match”, Postmodern world of the DIY superstores – such as the British chain Texas who opened their first warehouse in 1972 and had nearly 200 outlets by the late 1980s – that was to follow, almost anything, including the purchase of ready-made furniture and previously potted plants, was now to count as DIY. This would seem to speak less of doing-it-yourself and more, as the chain store of a similar name would imply, of trying to “do-it-all”. Nonetheless, DIY, at any level of consumption and practice, continues to provide a vehicle through which householders can retain some degree of self-expression while at the same time remaining in touch with current interior design trends. As Alan Tomlinson pointed out, “the DIY phenomenon is not class or gender specific. It is not only the hi-tech specialist who does the carpentry: it is the bus driver, the nurse, the postman,” and it is clear that ever since DIY arrived householders have made, and will continue to make, carefully measured contributions, over a long period of time if necessary, towards the construction of their own home environment.

Doors

Doors may be said to fall roughly into two types – namely interior and exterior doors – and their size and shape will largely depend on the period of the building concerned. Similarly, door furniture, hinges, handles, locks and knockers, will also reflect the particular use and status of the door and the building of which it forms a part.

Originally there were two main methods of constructing doors: ledge-and-brace or batten doors, and panelled doors. Exterior doors tended to be of the ledge-and-brace design, which meant the door was constructed from a number of vertical planks (ledges) held together by a Z-shaped brace nailed to the back of the door. Such sturdy items formed the basis for almost all doors prior to the late 17th century; Tudor doors, for example, were made from wide oak planks strengthened by a second set of planks laid across the back at right-angles. This version was called a double-boarded or cross-boarded door. Interior doors were usually panelled and their construction was lighter and more technically complex than the ledge-and-brace design. Thus they were more expensive and required the skills of a joiner, rather than a carpenter, to construct a wooden framework into which the panels were set.

Seventeenth-century interior doors were rather simple, consisting first of two and then four panels, which reflect the ordered classical interiors of the period. By the late 18th century, however, the six-panelled Georgian door was uniform in most houses, although thin four-panelled doors with no mouldings remained the standard servant area fittings on the upper floors of wealthier houses.

Since exterior doors are, by their very nature, strong and heavy, their decoration tends to be of a more robust form. Tudor door fittings were basic, with wooden latches and handles operated by string and main doors decorated by flattened nail heads, although the grander houses did have some lighter doors with a frame filled with wooden linenfold panels. By the 17th century, however, exterior doors were increasingly embellished by classical stone surrounds of columns, pilasters and pediments. The grander the house the more impressive the entrance: front doors were placed at the tops of steps, or covered with shaped wooden canopies painted white, such as those still to be seen in Queen Anne's Gate, London.

An important feature of the 18th-century exterior door was the fan-light which served to increase the amount of light let into the front hall. It gradually reduced the size of the front door and probably encouraged the Victorian taste for the stained-glass front door which was so familiar a feature of domestic housing at the turn of the century. During the second quarter of the 19th-century, glass was also being used (mainly in French and German houses) in internal doors to conservatories, glass-houses and vestibules. Folding doors were especially popular in 19th-century houses as they enabled rooms to be opened up, and sliding doors were probably introduced by the end of the century.

Interior doors reflected these stylistic changes, but because interior doors were protected from the elements they could be finely decorated with unusual inlaid woods such as holly and cherry, painted scenes or carved mouldings. If the wood was of good quality like ebony, it was left bare or polished; this was the case at Chiswick House where the panelled doors designed

by William Kent were simply varnished and their decorative moulding picked out in gold leaf. The moulding was usually carved in sections and may have been in the form of beading, egg-and-dart or the acanthus leaf pattern. Main doors were painted to blend in with decorative schemes, such as the painted doors in fashionable Pompeian interiors designed by Robert Adam at Osterley Park, London. During the Greek Revival of the early 19th century, doors were further embellished by fluted pilasters and curved panelling, and the door handles, finger-plates and locks were increasingly elaborate.

By the late 19th century, mass production and the eclectic tastes of the period ensured that doors came in every shape and size. Moreover, the revival of fashions from the past saw the reintroduction of old methods of manufacture: American Beaux-Arts interiors, for example, featured oak-plank doors decorated with carved wooden swags, garlands and cartouches; Queen Anne Revival doors had shelves above them where ceramic plates and vases were crammed in to look authentic. The mass production of domestic furniture and the vast range of different pattern books suddenly on the market also meant that most people could afford to have a relatively smart front door.

In order for a door to function, hinges, handles and locks are required. The earliest hinges were called strap-hinges (known in North America as a cross-garnet hinge), which was a T-shaped hinge usually made of wrought iron, with the cross bar fixed vertically to the door frame. These substantial hinges were nailed rather than screwed to the woodwork and could be rather decorative. In the 18th century, interior doors were fitted with either H- or L-shaped hinges, again with nails rather than screws, the best examples being hand-cut until the introduction of machine-made screws in the 19th century. Other hinges to appear during this period were the hidden and rising-butt hinge. The hidden hinge, as its name suggests, has the fixings set into the frame of the door and sunk into the door surround or architrave. The pivot, or pintle (the pin running through the two parts of the hinge allowing it to swing) made the door more decorative. The rising-butt hinge, which appeared in Britain c.1750, was spirally pivoted so that the door raised up as it opened, thus clearing a fitted carpet and dropping down again when still to stop draughts.

The use of door locks was relatively unknown before the 16th century since they were expensive, cumbersome and considered a luxury by the majority of home-dwellers. The earliest locks in use were rim locks, also known as box locks. They were fitted onto the surface of the door (internal doors were too thin to support an internal mechanism) and were usually covered by a wooden, iron or brass box, hence the name. Rim locks were the standard type used in British and North American houses until the mid-18th century when the mortise lock appeared. These locks were designed to fit into a slot, or mortise, cut into the frame of a panelled door. Doors were also secured by sliding barrel bolts and heavy, wrought iron bars to secure the main front doors of the grander houses.

The design of door furniture such as handles, escutcheons, finger-plates and knockers or letter-boxes for front doors, developed relatively late in comparison to hinges and locks. Some noticeable exceptions were the Neo-Classical escutcheons Robert Adam designed which featured classical swags and lion heads; and fretted brass fingerplates were

common in the 19th century, as were ceramic door-handles. Particularly fine examples of surviving decorative door furniture are the elaborate brass Gothic designs produced by A.W.N. Pugin for the Palace of Westminster, and Art Nouveau finger-plates made from hammered copper, brass or silver.

Doors are useful for the historian in many ways in that, like fireplaces, they will usually reflect contemporary tastes in interior decoration long after rooms have been changed and walls covered over. Where and when they do survive, their paint-layered surfaces remain a valuable indicator of changing fashions. As for knob, knockers and handles, they may be called "door furniture", but as a recent style article in *The Times* declared, "in fashion terms, they are clothing accessories" for the fashion conscious.

Dorn, Marion 1896–1964

American textile, wallpaper and interior designer

Marion Dorn is best known for the work she did in Britain during the 1920s and 1930s when she was a leading figure in the re-assessment of the function of textiles in the interior. Her textiles were to be seen regularly in the architecture and design press of the day, chosen by architects and interior designers as important components of their creations. She was one of the first female textile designers to establish her design business as a limited company (1934) to facilitate her varied collaboration with large textile manufacturers, architects, interior designers and private clients. Her most celebrated output was in rug design and her success in this area continued when she returned to the United States in 1940.

Dorn settled in Britain in 1923, and designed and made batiks, a medium she had begun to work in when she lived in New York State with her first husband, the painter and potter Henry Varnum Poor. Her batiks were reviewed favourably in *Vogue* in 1925; conceived as fine art pieces, they were compared to tapestries or murals. In contrast to most of her contemporaries Dorn produced batiks on a large scale, designing decorative hangings or curtains which were used as focal

Dorn: interior of Ralph Rayner's home, Ashcombe Tower, 1937, with rugs, curtains and upholstery fabrics by Dorn

points in the homes of clients such as Noel Coward and the Countess of Lathom.

Dorn designed her first rugs in the mid 1920s and by the end of the decade exhibited them at the Arthur Tooth Gallery in London alongside rugs by her partner and future husband, Edward McKnight Kauffer. It was Dorn's practice to design rugs exclusively for particular customers or to produce limited editions; these were usually hand-tufted for her by the Wilton Royal Carpet Factory. Her contribution towards raising the status of the rug within the interior was unequalled by any of her contemporaries. She promoted the use of her rugs as fixed points within a space, around which other components were arranged; this was particularly the case in larger spaces such as hotels and ocean liners. Dorn was commissioned for various projects by the Savoy Company throughout the 1930s, beginning with a number of rugs for the re-decoration of Claridge's Hotel by Oswald P. Milne in 1932. The design of a circular carpet for the hexagonal lobby was dominated by directional lines in shades of light and dark brown on a fawn ground, the design suggested routes through the space. The following year Dorn produced designs for carpeting and rugs for Oliver Hill's Midland Hotel, Morecambe. The rugs for the lobby, with their directional design of waves, represented perfectly the hotel's seaside location. They also provided an important focus around which furniture was arranged. As with all her commissioned work Dorn produced rugs which in terms of design and colouring were in perfect sympathy with their surroundings. The Midland Hotel rugs in brown, ivory and brick-red complemented Hill's colour scheme of beige-pink walls, polished cement terrazzo floor and furniture of weathered sycamore. Hill continued to commission textiles from Dorn throughout the 1930s.

On several occasions the architect and interior designer Brian O'Rourke approached Dorn for suitable textiles for his schemes. In 1932 she designed a group of rugs for his decoration of Mrs. Robert Solomon's music room. Two years later he used Dorn's rugs to indicate different functions within one space in his scheme for the interiors of the Orient Line's ship

the *Orion*. These designs were praised by *Shipbuilding and Shipping Record* as providing the basis around which everything else was hinged. Dorn's willingness to meet the needs of her clients is evident in the work chosen by O'Rourke for Ashcombe Tower, the house he designed for the Member of Parliament Ralph Rayner in 1937. The architect and client visited Dorn's studio in Lancashire Court off New Bond Street, London, to choose the most appropriate rugs and fabrics. The theme of their choice was texture, with a herringbone weave for the furniture, horizontal striped fabric for the curtains and textured rugs.

A desire for aesthetic interest in textiles provided by means of texture rather than surface pattern made Dorn's work an obvious choice for many Modernist designers. Pattern in Dorn's rugs was often achieved by the use of contrasting textures, the combination of hand-tufting with flat weaving was used to good effect in several designs, such as the large cream rug with a linear tufted design which Syrie Maugham used in her own "all-white" drawing room in 1931. A similar design was used by Serge Chermayeff in his scheme for a flat in London. The popularity of Dorn's work with architects is illustrated by the press coverage she received in journals such as the *Architectural Review* and *The Studio*. Her fabrics would often be designed to enhance the architectural design of a building, and the rugs provided a limited but appropriate focus of pattern. As Dorothy Todd commented, Dorn aspired to provide "a floor service" for her clients, preferring wherever possible to plan her designs in relation to the room for which they were intended. This worked particularly well when she was able to act as the designer of a complete interior scheme as when she worked for the writer Arnold Bennett in 1931, and for the actress Diana Wynyard in 1936.

Dorn worked with the leading textile manufactures of the day, including Warner & Sons, Old Bleach Linen, Edinburgh Weavers and Donald Brothers. She operated as either a freelance designer of printed and woven textiles, or she commissioned these firms to produce fabrics to her designs which were then sold under the name of her own company, Marion Dorn Ltd.. The woven fabrics produced for her were popular with interior designers. Gordon Russell Ltd. used Dorn's tufted leaf fabric *Hasta*, woven by Edinburgh Weavers in the interior of the Prince of Siam's London flat in 1937, and Ian Henderson used two weaves (*Lodore* and *Dorn Upholstery*) in his design for Jean de Casalis's flat in 1936. Her printed textiles were often chosen as curtains and upholstery for the cabins of ocean liners; *Scallop Shell*, a hand-screen printed fabric was used in the bathrooms for Cunard's *Queen Mary* in 1936. As her experience of designing for hand-screen printed fabrics developed, simple motifs such as birds, leaves and flowers received a more sophisticated treatment. Her approach became more painterly with dashes of colour used to suggest rather than define shapes; this stylistic approach, combined with a more classical subject matter, dominated her later work of the late 1930s.

Dorn returned to America in 1940, and although she never enjoyed the huge acclaim she had received in Britain, she continued to run a successful freelance business. She was employed by Edward Fields Carpets on the basis of her British reputation. Throughout the 1950s Dorn produced designs for Fields which were based on the reproduction of pattern derived from other flooring materials, such as marble, parquet and

stone paving. Her work for Fields culminated in the design for a large oval rug for the Diplomatic Reception Room at the White House in 1960. She also developed her freelance work in wallpaper design which had begun towards the end of her stay in Britain; she produced designs for Katzenbach and Warren, Bassett and Vollum, A.H. Jacobs and Imperial. Wallpapers such as *Master Drawings* and *Cameo* (both produced by Katzenbach and Warren in 1949) represented the trend for bold, striking patterns used in limited spaces. In contrast she also produced simple designs such as *Persian Linen* (Imperial, 1952), based on a woven fabric, which was used for larger spaces. Her fabric designs for companies such as Greeff, Goodall Fabrics and Schumacher demonstrated her ability to react quickly to current trends. Dorn continued her practice of producing designs that were conceived in sympathy with the work of architects and interior designers. She received an Honorary Fellowship from the Society of Industrial Artists in 1957 for her "unique and quite outstanding contribution to British textiles".

CHRISTINE BOYDELL

Biography

Marion Victoria Dorn. Born in San Francisco, 25 December 1896. Trained as an artist; graduated from Stanford University, California, BA in education (graphic art), 1916. Married 1) Henry Varnum Poor, 1919 (divorced 1923); 2) Edward McKnight Kauffer, 1950 (lived with him from 1923; he died 1954). Settled in London and worked as a freelance designer from 1923; designed batiks from 1923, rugs from 1926, carpets from 1928, printed and woven textiles and wallpapers from the early 1930s. Associated with several textile and carpet manufacturers including Wilton Royal Carpet Factory, Warner & Sons, Donald Brothers, Old Bleach Linen, and Edinburgh Weavers; established her own company, Marion Dorn Ltd., with workshops and showrooms in London, 1934. Moved to New York, 1940; active as a freelance designer of textiles, wallpapers, and interiors, supplying designs for companies including Edward Fields Carpets and Katzenbach and Warren; retired to Morocco, 1962. Exhibited at Dorland Hall, London, 1933, and at the Paris Exhibition, 1937. Honorary Fellow, Society of Industrial Artists of Great Britain, 1957. Died in Tangier, 23 January 1964.

Selected Works

For a recent monograph on Dorn's work see Schoeser 1996. A catalogue raisonnée appears in Appendix 1 of Boydell 1992, which also includes the locations for surviving works. Examples of Dorn's rugs and textiles are in the Victoria and Albert Museum and the Museum and Art Gallery, Brighton; 20 designs for rugs survive in the archive of the Wilton Royal Carpet Factory.

Interiors

- 1931 Complete interior scheme for Arnold Bennett
- 1932 Claridge's Hotel, London (interiors by Oswald P. Milne; rugs by Dorn)
- 1933 Midland Hotel, Morecombe (building and interiors by Oliver Hill; rugs and carpets by Dorn)
- 1933–35 Savoy Hotel, London (rugs and carpets)
- 1934–35 S. S. *Orion* (interiors by Brian O'Rourke; rugs by Dorn): Orient Shipping Company
- 1935 Flats, Embassy Court, Brighton (interiors by Wells Coates; carpets by Dorn)
- 1936 Complete interior scheme for Diana Wynyard
- 1936 *Queen Mary* (printed textiles for the bathrooms): Cunard Shipping Company
- 1937 Ashcombe Tower (building and interiors by Brian O'Rourke; rugs and textiles by Dorn): Ralph Rayner, M.P.

- 1960 White House, Washington, DC (rug for the Diplomatic Reception Room)

Draper, Dorothy 1889–1969

American interior designer

Dorothy Draper was one of the first modern interior designers in the first half of the 20th century and, by 1934, she had appeared on more American magazine covers (*Time*, *Life*, etc.) than even First Lady, Eleanor Roosevelt. Her fame resulted from her pioneering success in commercial design, a newly created offspring of architecture and interior decorating, and her creative, affordable interior design solutions during the restrictions of World War II quickly established her as a heroine to American housewives. A champion of professional women, Draper forged a path for women in the work-place and began defining the boundaries of the emerging Interior Design profession. And according to *Harper's Bazaar* (1941), she was "brisk, iconoclastic, inventive, unapologetic, and successful".

Born Dorothy Tuckerman on 22 November 1889, Draper was raised an Edwardian debutante within the safe, yet sometimes restrictive, confines of Tuxedo Park, New York, an elite community founded in part by her parents, Paul and Susan (Minturn) Tuckerman, who traced their family history to colonial Connecticut. Dorothy attended Brearley in Manhattan, a private finishing school, but had no specific technical or artistic training. Throughout her career, she depended mainly upon

Draper: Coty Beauty Salon, New York, 1941

imagination and common sense augmented by extensive travel.

In 1912, she married Dr. George Draper, who became the personal physician of Franklin D. Roosevelt, after Roosevelt was stricken with poliomyelitis. Though this introduced a lasting and influential relationship between Dorothy Draper and Eleanor Roosevelt, the demands of his work isolated George Draper from his family. The Drapers' marriage ended in 1930 leaving Dorothy with the unwelcome image of a social divorcee, which remained with her for the rest of her life. In order to confront her new social position, she underwent psychoanalysis, which she later claimed greatly liberated her sense of design and color.

Barbara E. Scott Fischer of the *Christian Science Monitor* (1941) described Draper as tall, tailored, and as decisive as a man, and later 20th century feminists may well count Draper among the early, trailblazing, career women. Although she received financial support to start her business from her parents, it was her masterful manipulation of men, materials, and the media that made her a monumental success. Her first venture, the Architectural Clearing House, founded in 1925,

had the goal of introducing the "proper" architect to the "proper" client, and was a triumph. Draper's own duties ranged from detailed discussions of plans with architects and builders and giving ideas on everything from storage bins to roof terraces, from the inspection of radiators to the spacing of windows. Although Draper initially felt intimidated by architects because of their superior education, she soon achieved a sense of equality both from design and financial standpoints. But her growing success, and the new self-confidence that it gave interior decorators, was increasingly regarded as a threat by architects as they perceived a portion of their profession slipping away. This rivalry culminated in 1952 at the Association of Interior Decorators Dinner honoring Frank Lloyd Wright, when the famous architect openly criticized decorators, by referring to them as "inferior desecrators," and named Draper specifically. Present in the audience, Draper rose, and politely ended his diatribe. This confrontation between two national heroes set the stage for a struggle between the professions that continues even today.

Despite jealousy from both architects and her fellow deco-

rators, by 1939 a large proportion of the American public perceived Draper as the undisputed spokesperson for the Interior Decorating profession. She entered the Hall of Fame in 1933 for her decorating of the River Club and was chosen as sole representative in decoration by the National Federation of Business and Professional Women. In addition, a media deluge kept her name on the lips of more housewives than any other decorator in history. She wrote two books on the subject – *Decorating is Fun!* (1939) and *365 Shortcuts to Home Decorating* (1968) – took to the airwaves with her own radio show, *Lines about Living*, and was encouraged to take charge of *Good Housekeeping's* "Studio for Living" section in June 1941. After being interviewed in 1939 by *Vogue* and *Harper's Bazaar* in her own Bandbox Apartment on 3rd Avenue, her popularity became international. Commissions were hers for the choosing; she accepted residential projects like the Walter Winchell estate, but turned down the Duke and Duchess of Windsor and President and Mrs. Eisenhower because their projects were too small.

During World War II, a majority of decorators were forced to close their doors or to cut their payrolls drastically. Draper, however, seized the moment and used her talents to aid the war effort. With the national economy completely devoted to the war, she utilized all of her media tools to reach out to the American housewife and breathe hope and optimism into days otherwise shrouded in loneliness and death. Because of the fear of air-raids, the citizens of New York City were asked to board up their windows; Draper advised the public how to conceal such eyesores. Her burlap and heavy drapery treatments became the fashion overnight. In addition, her programs, such as, "How to Buy a House for Under \$500, Furniture Included," "A Christmas Celebration for \$4.05," and "How to Decorate and Recycle the Home Interior" aided in maintaining morale on the homefront.

Draper created dramatic interiors through imagination, attention to function and a creative interpretation of historical sources. It was not uncommon in her work to see American Federal motifs in predominantly Roman Imperial interiors or juxtapositions of Italian Renaissance damasks and tropical designs. While the majority of her work was in New York, Draper's commissions stretched across three continents: the United States, South America and Europe.

After decorating a series of three personal dwellings in New York, one of which included the "Upside-down" House (1923), named because she created a garden terrace on the top floor in order to make room for a garage, Draper established a traditional approach to domestic design through fidelity to historical periods. Draper's interiors in the 1920s were conventional and similar to those of other decorators. Her Imperial Roman lobby at the Carlyle Hotel, 35 East 76th Street (1928), demonstrated her attention to history and was her first large commercial commission. In the 1930s, however, she began to expand her historical repertoire to include the Modern Movement. During this period, she also completed her course of psychoanalysis and her unique style emerged. In 1934, she unified a city block, Sutton Place tenement apartments, both without and within, by combining black with dead white trim and a variety of boldly colored doors. This project brought high society back to Sutton Place South, and was a great financial success.

Two years later, Draper was commissioned to design the Hampshire House Hotel, 150 Central Park West, out of a field of 154 decorators. It was the largest commission to date entrusted to a woman. At the Hampshire House Draper demonstrated a new design vocabulary, characterized by bolder contrasts and a greater sensitivity to the patterning of architectural surfaces. In addition, she designed her famous *Cabbage Rose* pattern for both fabric and wallpaper. Inspired by Georgia O'Keeffe, she dispensed with traditionally delicate motifs and produced patterns of heroic size. Confident of the success of the *Cabbage Rose* design, Schumacher produced over a million yards and it was one of the company's all-time best-sellers. In 1941, Draper outpaced all her contemporaries with her design for the Coty Beauty Salon in New York. For the first time, she combined a Modernist's use of space with exaggerated historical motifs and highly unconventional color schemes. Massive dead-white Baroque ornamentation framed doors and appeared as balustrades against blue and cherry-red walls and accents. Such combinations were extremely innovative and with the Coty commission, Draper defined a new interior type, since the beauty salon was a recent addition to the commercial market.

Her most spectacular foreign project, which generated a \$30,000 fee – the largest commercial contract in the world to date – was the Quitandinha Resort in Petrópolis, near Rio de Janeiro, Brazil, completed in 1944. Consisting of a hotel and casino, the Resort was also the first project into which she introduced regional themes and motifs. She designed custom-made furniture, extruded in shape from the floor plan, and used out-scaled Baroque scroll work and chandeliers nearly 15 feet in height to create breathtaking spaces. Again, she produced a fabric line, *Braziliance*, which was Schumacher's most famous line to date.

In 1954 Draper designed the still-extant cafeteria in the Metropolitan Museum of Art in New York. The space is basically a Roman atrium featuring columns and an impluvium or pool located in the center of the space. She gave the space an unarchaeological twist by designing great, swooping, strap-metal chandeliers. In 1958, Draper further refined her unorthodox style at the International Hotel, Kennedy Airport. Here, she designed large floor patterns which she extruded up to create large-scale custom-made furniture. One of the more spectacular pieces was a serpentine sofa, predecessor to the curved modular sectional of the 1970s. In a set of tables with X-shaped metal legs, Draper revealed the influence of Modernist furniture designers like Mies van der Rohe and Eero Saarinen.

Little is known of Draper's design process. On the larger commissions such as the hotels, for which she designed everything from furniture to the buttons on the bellman's cuff, she apparently executed rough conceptual sketches to create a basic sense of atmosphere and furniture placement, and then had her artist, Glenn Boyles, produce more detailed renderings under her verbal guidance. Final approval often required many attempts. Her staff comprised an impressive group drawn from various applied arts colleges and included the designers Lester Grundy and Ted Stewart and social secretary Belle Clark. The designers were often given projects immediately after Draper's initial visit; as long as the client was aware of her involvement within the process, it was unnecessary for her to be physically

present on site. In addition, Draper carried all of her contractors in a "little black book," which became a compilation of some of the best craftspeople in the business, all of whom were fiercely loyal to her.

Other Draper commissions included: the Gideon Putnam Hotel in New York (1933); the Arrowhead Springs Resort in California (1939); the Camellia House at the Drake Hotel in Chicago (1940); the Delnor Hospital in St. Charles, Illinois (1940); Mayflower Hotel in Washington, DC (1940); Kerr's Department Store, Oklahoma City, in which she was able to increase the selling space by over 40 per cent (1944); Fairmont Hotel in San Francisco, in which Draper collaborated with architect Julia Morgan, (1945); the Versailles Dinner Club in New York (1945); and the Greenbrier Hotel in White Sulphur Springs, West Virginia (1946). In addition, Draper received design commissions for railway interiors and floating hotels as well as the interior of the 1952 Packard automobile, Convairst Airline Interiors, and the packaging for *In the Pink* perfume for Gimbel's Department Stores.

For a woman once so well-known, it is hard to believe that today Draper is virtually forgotten. In many respects, she may be the quintessential interior designer. She created a unique style, promoted herself successfully within the domestic and commercial arenas, and stood face to face with male business tycoons, whom she described as "cowards when it comes to color." She opened the door for women in the work-place and began defining the field of modern American commercial Interior Design. In describing Draper, she said it best herself: "Be critical, never humble."

JOHN C. TURPIN

Biography

Born Dorothy Tuckerman in Tuxedo Park, New York, 22 November 1889. Educated at Brearley School, New York; received no formal design training. Married George Draper, 1912 (divorced 1930). Active as an interior designer in New York from the 1920s; established the Architectural Clearing House, 1925; received many commissions for hotels and restaurants, apartment buildings and department stores from the 1930s; interior design business sold in 1960. Published extensively on design and decoration; appeared on her own radio show, *Lines about Living*, 1940–41; director of the "Studio for Living" section in *Good Housekeeping* magazine, 1941. Designed fabrics and wallpapers for Schumacher from the mid-1930s, and furniture from the 1940s. Died in New York, 1969.

Selected Works

Interiors

- 1923 "Upside-down" House, New York (interiors)
- 1928 Carlyle Hotel, 35 East 76th Street, New York (Imperial Roman lobby)
- 1933 Gideon Putnam Hotel, New York (interiors)
- 1934 Sutton Place Apartments, New York (interiors and exterior colour scheme)
- 1936 Hampshire House Hotel, 150 Central Park West, New York (interiors)
- 1940 Camellia House, Drake Hotel, Chicago (interiors)
- 1940 Mayflower Hotel, Washington, DC (interiors)
- 1941 Coty Beauty Salon, New York (interiors)
- 1944 Kerr's Department Store, Oklahoma City (interiors)
- 1944 Quitandinha Resort, Petrópolis, near Rio de Janeiro (interiors and furnishings)
- 1945 Versailles Dinner Club, New York (interiors and furnishings)

- 1946 Greenbrier Hotel, White Sulphur Springs, West Virginia (interiors and furnishings)
- 1954 Metropolitan Museum of Art, New York (restaurant interiors and furnishings)
- 1958 International Hotel, Kennedy Airport, New York (interiors and furnishings)

Draper's textile designs included *Cabbage Rose*, *Braziliance*, and *Scatter Floral* fabrics for Schumacher, and *Stylized Scroll* for Waverley.

Drawing Rooms

As a room-type, the modern drawing room retains a schizophrenic quality, split somewhere between a "gala" space and a family sitting room, which reflects what Edith Wharton once termed its "mixed ancestry" (*The Decoration of Houses*, 1897). Its development can be traced back to a small apartment, linked to the principal bed chamber, which provided a degree of privacy from the communal life of the medieval Great Hall. This type of "withdrawing" room lacked specialised furniture and created an indeterminate but relatively intimate space into which all or part of a small company

Drawing Room, Durham House, London, 1887

could temporarily withdraw. In the Apartment system of processional “shewed” interiors introduced to grand British houses from France and the Low Countries in the late 17th century, the drawing room continued to function primarily as a buffer zone in the sequence of State rooms, playing a supporting role in relation to the more glamorous State bed chamber and Baroque dining room.

By the early 18th century, however, this kind of drawing room occasionally co-existed with, and was subsequently modified by, the influence of more grandiose European models, in particular the Italian *salone*. In its original form the *salone* was a multi-storeyed space dedicated to large-scale gatherings and formal entertainment, and was characterised by bold, showy decor with minimal furnishings. Inspired by this prototype, the expanded British drawing room, and the “saloon” to which it was often closely linked, assumed a higher profile and more distinct character. A typical example is the barnlike “parade” space of the Great Drawing Room at Hopetoun created in the mid 18th century. Such a showpiece was reserved for large-scale formal entertainment rather than day-to-day use. The moveable furniture was set out in symmetrical order against the walls. Key signifiers of major expenditure were the pure white marble fire-surrounds, the colossal yardage of silk damask for upholstery and wall coverings, the glass mirrors with sconces for dozens of wax candles, elaborate plasterwork

on the ceiling, and extensive gilding on the interior ornament and matching furniture. Similarly, the lofty saloon in a house like Robert Adam’s Culzean Castle (1780s), with its spectacular westward vista out to sea, provided a climax to the staircase and sequence of public rooms on the first floor; typically it was circular or oval in plan, with a coved, and elaborately decorated ceiling. Although such glamorous schemes were few and far between, they were significant in formalizing many of the decorative conventions subsequently associated with the middle-class drawing room.

By the end of the 18th century a more Picturesque approach began to free up the disposition of the furnishings. Greater flexibility in the way the room could be used and the introduction of a diversified range of seating and tables allowed for varied groupings of people and activities. Apart from being the main reception room for both casual callers and formal entertainment, it was also becoming the space where the women of a household, and in some cases the children, would spend much of their time during the day. When there was company, family and guests would assemble there in more formal mode to be shuffled into order of precedence before the ritual procession through to the dining room. Later in the evening the gentlemen would rejoin the ladies in the drawing room for tea, cards and informal conversation to round off the day. The custom of women withdrawing from the dining room, leaving

the men to get on with prolonged bouts of drinking, began to wane in Europe and America in the mid to late 19th century (but appears to have remained entrenched in Scotland).

While a party in summer might fall into little detached groups scattered all over the apartment, in winter the company tended to form into one large cluster around the fire. In many cases it was easier to shut up drawing rooms altogether out of season, removing textile wallhangings to storage. In fact the vast majority of people could not afford a highly specialised sequence of rooms, particularly a drawing room which tended to take up more square footage and window frontage than any other interior. Heating, lighting and maintaining such large rooms for occasional use was a formidable task. Case-covers shrouded the precious upholstery most of the time, and candle-light was kept to a minimum.

In its evolved 19th-century form, elements of the stately saloon-type drawing room were to become effectively merged with the pre-existing tradition of a more family-oriented living space, in a curious blend of formality and informality. With the quest for comfort intensifying throughout the 19th century it is not surprising to find that larger houses often accommodated an additional Small Drawing Room, (sometimes labelled the Morning Room) as an escape from the chilly formality of the State apartments. This smaller room might be equipped with draught- and fire-screens for sitting cosily near the fire, a bookcase for reading matter, and a breakfast table for light meals. The main drawing room, on the other hand, was equipped with greater quantities of lighting, mirrors and seating for formal evening entertainment, along with the necessary accoutrements for tea and cards. Often such rooms would be furnished en suite on the principal floor so that the spaces could be interconnected by folding doors for large parties.

The drawing room assumed new and increased importance as the focus of the 19th-century cult of bourgeois domesticity, embodying family values and the civilizing influence of the home. An emphasis on cultural and artistic values was frequently symbolized through decorative schemes featuring the Muses or musical trophies, and through inclusion of the relevant furniture and props. The various table tops would be liberally scattered with small artworks, work- and drawing-boxes, writing equipment, folios of prints and drawings, and books of poetry or novels. Most commonly a piano, music stand and canterbury signified a musical household, while needlework skills were signalled through the presence of a spinning wheel, sewing table or embroidery frame; portfolios, easels, a small bookcase and writing desk were further indicators of artistic and literary activity. As the furnishing of the drawing room was, among other things, about the art of self-presentation and the reception of visitors, it was particularly important for young unmarried women to make their accomplishments evident. Private tutors and various ladies' magazines or books gave instruction in a wide range of decorative skills or "fancy work" which could occupy endless hours and be used to beautify the domestic interior – crafts such as chip-carving, pokerwork, staining, stencilling china or glass painting and repoussé metalwork. The most well-established and widespread of such domestic arts was needlework. There were aristocratic and genteel models to follow, as demonstrated by the survival in the drawing room of numerous historic

samplers, "sewed" seat covers and embroidered boxes or frames.

There was widespread agreement that the drawing room's arrangement be left to the lady of the house. Within the home, it was perceived as the most "feminine" of the key rooms, providing an explicit and elaborate contrast to the "masculine" dining room. The picturesque variety of the drawing room's seating, cabinets and tables was in marked contrast to the restrained and formal symmetry associated with the dining room. Materials of a perceptibly higher quality were used and the reflective glitter of the gilding, the silky fabrics, elaborate veneers and mirrored or French-polished surfaces to be found in the drawing room were deliberately played off against the "solid" and unadorned materials in more masculine schemes. Upholstery was usually of velvet or silk-damask as opposed to horsehair, leather or plain repp; grates would often be of bright-cut or inlaid steel rather than brass or iron, and the furniture predominantly of rosewood or walnut, embellished with decorative inlays, carved detail and gilding. The proliferation and complexity of objects in the drawing room, and the variation of mass and outline in their grouping, expressed notions of civilizing "refinement". Accents of deep subtle colours, variegated patterns, or the application of veneers could all enhance a luxuriant effect. In particular, the availability and range of household textiles and wallpapers, formerly the preserve of aristocratic households, had been transformed by technical innovations. Although for the most part spun and woven by machine, textiles still retained associations of richness and refinement. The protective, womb-like muffling of the drawing room in layers of curtains, carpets, fluffy rugs, frilly lampshades, cushions and padded upholstery all gave the space a distinctive sound and feel aimed at inducing a state of physical and mental comfort.

Being the showpiece of the home, watercolour, printed and photographic images of the drawing room proliferated in the 19th century. The impact of such representations was intensified by the fact that they were designed to be looked at and enjoyed within the context of the drawing room itself. Photograph albums and stereoscopes or magnifying glasses encouraged an appreciation of intricate visual detail. The art of systematic looking was also encouraged through recording the drawing room in watercolour and pencil sketching, an activity deemed entirely appropriate for the context of the space. Small bookcases and reading lamps in most drawing rooms equipped avid novel-readers to consume literary descriptions of domestic interiors. Novels were considered suitably lightweight reading matter for an interior which was supposed to entertain idle hours.

The mirrors over fireplaces and pier tables which dominated most drawing room schemes constantly reflected women's appearance back to them and women were often depicted against the backdrop of a drawing room. Indeed, they were encouraged to see themselves as part of the drawing room scheme, and to match their figure, complexion and dress to the domestic environment. Not surprisingly, therefore, drawing rooms were frequently sucked into the negative comment surrounding the topic of women and fashion. As with the clothes they wore, women were often criticized for "dressing up" their drawing rooms to be attractive. The apparently

random accumulation of small decorative objects was a particular butt of criticism.

As the showcase for artistic discrimination and individual taste, the drawing room accommodated collecting interests focused on small, exquisite and rare or curious items. Contemporary photographs show vast numbers of such items strewn around the table tops, in and under display cabinets, and stashed into the nooks and crannies of towering overmantels or hanging shelves. It was felt that such objects would stimulate the imagination and refined conversation, providing an informal education through the emanation of moral sentiment, history and cosmopolitan culture. Some items had a clear iconic and symbolic value, while others such as framed photographs and jewellery reflected more sentimental and personal interests. The "Chinamania" which reached its height in drawing rooms of the 1880s and 1890s was a competitive and fashionable pastime for both men and women. In less affluent homes the projection of artistic taste could be relatively cheaply paraphrased with a few bits of bric-a-brac and mass-produced china.

Within the home generally, and the drawing room in particular, women were expected to create an oasis of light and calm. Furnishings which were light in colour and form could provide a material analogy for the hygienic and spiritual purity of the household. The drawing room usually had more windows than any other room, and ideally a southerly aspect with a view upon which great importance was placed. The regenerative, colourful and sensual power of nature certainly enhanced the concept of the drawing room as an antidote to the drab world of work, and as an "unsullied" environment feeding the imagination and spirit. Nature was introduced directly to the drawing room through dried and cut flower arrangements, potted plants with elaborate jardinières, and collections of natural objects such as shells or semi-precious stones. In the 1850s and 1860s fern cases and aquaria were particularly in vogue. Still-life or landscape pictures could be displayed either on the walls or in albums. Gardens were also evoked indirectly through conventionalized ornament derived from nature. Drawing room carpets, upholstery and wallpaper were frequently floral in design and at a more abstract level the generally curvaceous, swelling forms of the furniture triggered similar associations.

Historical and foreign styles were used to conjure up the appropriate sensual qualities and social nuances for a drawing room, the most popular undoubtedly being an 18th-century French look creating an impression that was organic, glitzy and cushioned, with overtones of aristocratic refinement. Chinoiserie or the more exotic 18th-century styles were frequently recommended as a means of releasing the imagination, while a touch of Moresque and Oriental added a discreet hint of colourful luxury, mystery and sensuality. Drawing rooms of the 1880s and 1890s were characterized by an increasingly eclectic blending of styles and materials, and a self-conscious integration of old and new elements, though the overall emphasis was still very much on 18th-century styles. This mish-mash was to be given coherence and made "home-like", through the individual taste of the owner.

The cult of simplicity, which developed from the 1880s and continued into the 20th century, entailed a paring down of the drawing room's ornamental features and the thinning out of its

contents. "Artistic" drawing rooms popularised a new, more reductivist aesthetic, while even in less self-consciously artistic households, social change was rendering the historical baggage and function of the drawing room obsolete. Simplified, more open planning was leading to greater continuity between adjacent interiors, and, like the hall and library, the drawing room was now increasingly furnished as a family "living room". Various authors on household taste in the 1920s referred to "the passing of the drawing room", not least because ladies were "fast becoming men", and therefore did not need a space into which to withdraw. The preferred terms were "living room", "sitting room" or "lounge". The usage of these labels was more linked to style and class connotations than clear differences in the purpose served by the room. While the familiarly lumpen and cosy forms of the three-piece suite marked the rise of the lounge and sitting room, the drawing room was generally distinguished by references to 18th-century styles with their overtones of genteel and elegant living. From its sumptuous Victorian and Edwardian heyday the drawing room had been diminished to a label which then, as perhaps now, persisted only "amongst a few who still have early Victorian tendencies".

Dresser, Christopher 1834–1904

British designer

A pioneer of modern design, Christopher Dresser was one of the most radical and prolific designers of the 19th century. His output included ceramics, glass, metalwork, furniture, carpets, fabrics, wallpapers and every aspect of interior decoration. He was one of the first designers to be professionally trained for industry and he worked for at least sixty of the most forward-looking Victorian manufacturers. His designs were well-known in Europe, America and Japan and his wallpapers were produced in America and Germany where they exercised a decisive influence on the development of Modernism. Finally, he was also an influential writer on botany, design and interior decoration. He stressed the importance of function and simplicity, as well as subdued colouring and restrained ornamentation in interiors, and his theories were regarded as among the most advanced of his day.

Dresser also prioritised the role of the designer within manufacturing. He was one of the first European designers to imprint his signature next to the maker's mark and during the early 1860s he pioneered the elevation of design and interior decoration to the status of an art. This development in turn encouraged the emergence of terms such as Art furniture, Art pottery and Artistic or Aesthetic interiors. And although little of Dresser's own work within interiors has survived, his ideas are fully documented in the numerous publications he produced from the early 1860s which provided ample advice on the decoration of ordinary middle-class homes.

Dresser's style was based on a general affinity with Early English medieval art and on his admiration for oriental and Japanese art. But he was never dogmatic in his adoption of past styles, and his free mixing of historical pastiches with ideas from diverse cultures gave rise to a highly personal manner that was closely attuned to the spirit of the times. His championship of Japanese art was particularly important and he played a leading role in the introduction of the Anglo-Japanese or Modern English style in the last third of the 19th century. In 1876–77 he became the first European designer actually to visit Japan and he established a number of trading companies which presented Japanese art and architecture on a larger scale to the British public. He also published one of the first European books on Japanese art in 1882 which consolidated his campaign for the acceptance of Japonisme. He particularly admired the simplicity of construction and subtlety of colour in Japanese interiors and design. In place of the early Victorian emphasis upon polychromy, he advocated the use of secondary and tertiary tones. Primary colours were permissible in decorative patterns on walls and ceilings but when viewed from a distance they should give the impression of a natural bloom "similar to that of the peach, where all the colours of the rainbow combine".

Dresser: wallpaper for Sanderson, c.1878

These views were propounded in his writings, which were enormously influential. Dresser's early publications represented the first thorough discussion of interior design and became popular reading long before those of contemporaries such as C.L. Eastlake, William Morris or E.W. Godwin. Indeed, Dresser's influence was arguably far more widespread than that of most other craft-oriented architect-designers, for although Dresser, like Morris, preached the gospel of art for the masses, he also appreciated the advantages of machine production and his enormous output reached a far larger audience through the techniques of mass-production and modern industry. And similarly, although his ideas were not publicly acknowledged by Morris or other Aesthetes, Dresser was largely responsible for promoting the ideal of the "aesthetic interior" which gained momentum during the 1860s and 1870s. He placed special emphasis upon the need for carefully chosen colour schemes and suggested particular combinations for different rooms. His ideas for a drawing room, for example, included blue or multicoloured ceilings, citrine or yellow-orange walls, maroon or purple dadoes, and bronze-green doors surmounted by black architraves – colours that were intended to inspire "purity, activity and enlightenment".

He also presented a programme for a blue study and a red dining room, "suggesting strength and beauty", and a purple nursery and olive breakfast room, "inspiring feelings of repose and gladness" respectively. For kitchens and rooms intended for manual work, he recommended buff or dark yellow tones. These distinctive colours became the favoured palette of the Aesthetic Movement and had become so popular by the 1880s that Gilbert and Sullivan's satirical opera *Patience* employed the phrase "greenery-yallery" to signify the taste of the Movement.

Dresser's treatment of ceilings was particularly distinctive. He strongly disapproved of the fashion for whitewashed ceilings and advocated instead the abundant use of colour, especially blue. His ceiling decorations also always complemented the treatment of the wall and he designed some of the first matching frieze-fill-dado-ceiling papers, produced by the wallpaper manufacturers Jeffrey & Co. from 1871. He also often employed relief materials such as Linoleum Muralis and was one of the first designers to produce patterns in the Anglo-Japanese style for the Lincrusta Walton (from 1876) and Anaglypta (from 1887) firms. Some of his most sophisticated hand-painted ceilings were incorporated in the interiors (some of which are still *in situ*) he created for Thomas Shaw's Allangate Mansion, in Halifax, where the rich, oriental-style patterns in iridescent shades of green, turquoise, blue and gold, were said to have cost its owner some £3,500. And following his return from Japan in 1878, Dresser promoted the adaptation of Japanese ceilings with overlapping floral patterns superimposed with an open framework of joists which became increasingly widespread in Britain during the 1880s and 1890s.

For walls, he recommended plain colours or tinted decorations, sometimes enriched with a simple powdered pattern or a wallpaper in "subdued colours", as greatly preferable to the naturalistic patterns featuring large bunches of flowers combined with animals or human figures that were characteristic of much commercially produced work. He argued that allegorical symbolism could be most successfully embodied in stylised or abstract ornamentation, and that the motifs should have a bilateral arrangement and "in all cases consist of flat ornament" and of "small, simple repeated parts, which are low-toned or neutral in colour". The majority of his designs were in his favoured Anglo-Japanese style incorporating grill or lattice patterns combined with diaper or overlapping floral patterns and sometimes including exotic insects or birds. After his tour of Japan, Dresser launched a series of papers printed in various shades on plain, brown sugar-papers, and most of the wallpapers from the latter period of his career expanded on this colour scheme. His output was prodigious and by the time of his death he had designed more than a hundred papers for over 17 different manufacturers in Europe and America.

Dresser's designs for carpets were equally numerous. Rejecting the naturalistic designs that were still commonplace in the third quarter of the 19th century, he argued that carpets should be restrained in colour and that they should serve as a background to the furnishings and contents of the room. From 1862 he championed the use of geometrical and conventionalised Oriental patterns and advocated designs based on the principles of geometry that, he believed, reflected the way that plants and flowers should appear when viewed from above. Most of his own carpets contained patterns based on radiating

leaf and floral forms, framed by scrolls or banded borders at their edges. Some examples included a slight relief imitating the *ton sur ton* effect of Chinese rugs and, like Morris, Dresser clearly hoped to make Britain independent of the carpets imported from the East. He also helped to reform the design of floorcoverings in America and in 1873 he was commissioned to produce a government report on design "applied to objects and to houses" that included many useful comments on carpets and rugs. His personal output included several hundred carpet designs the majority of which were produced as double-cloth Brussels carpets and as "spool" Axminster rugs by John Brinton Ltd. and by John Crossley.

Dresser was also active as a designer of furnishing fabrics and designed lace produced by Edward Cope, silk and woollen damasks and worsted woollen fabrics by W. & C. Ward and by Norris & Co. (later Warner & Co.), cotton damasks for John Wilson and Sons, Lotus fabrics for Arthur Liberty, cretonnes for Steiner & Co., and towels, bedspreads and quilts for Barlow and Jones and others. Barlow and Jones's *Empire* quilt (1887) and *Colombian* quilt (1893), produced to commemorate Queen Victoria's Golden Jubilee and the discovery of America, were particularly admired and proved highly popular.

Stylistically, Dresser lamented the general "want of simple structure, want of simple treatment, [and] want of simplicity of effect" in British textiles, and he proposed simple and conventionalised motifs such as circles, diapers, vertical and diagonal stripes as suitable for hanging fabrics. He also stressed that the laws governing the design of textiles were identical to those for carpets and that hanging fabrics should follow the rules applied to wallpapers – namely a bilateral arrangement of themes. Several of his designs were in the Anglo-Japanese style and his use of layered compositions, made up of ground and superimposed motifs which derived from his admiration of Japanese textiles, was far ahead of his time. These layered and juxtaposed patterns proved extremely influential and made an important contribution to the reform of ornamental design in Britain.

Dresser also designed furniture, metal fittings, stained glass and all the objects required to decorate a house. His designs for furniture date from the late 1860s and although the history of his early work is still quite obscure, some of his pieces may have been produced by C. L. Eastlake's Art Furniture Company (fl. 1869–71). Like Eastlake, Dresser advocated built-in ensembles and admired Japanese and Early English and medieval prototypes and emphasised principles of sound construction with minimal carving and upholstery. Unlike Eastlake, however, he disliked the prevalent Neo-Renaissance and reformed Gothic styles which he regarded as unsuited to a modern Protestant society. And although much of Dresser's Art furniture was frequently referred to as Anglo-Japanese, it also reflected a sifting of ideas from Early English, Egyptian, Islamic and Greek sources and, in its constructional honesty, angularity and simplicity, it represents a highly individual and radical departure from ordinary Victorian furniture. Pieces such as tables and chairs often appear quite sturdy and robust, and sometimes incorporate lattice panel backs and intricate substructures which contrast solid and void and the regular with the irregular in the characteristic Anglo-Japanese manner. Much of Dresser's furniture was also painted in ebony and

lacquer tints with deeply incised and gilded borders and the cabinet doors sometimes included grotesque or humorous motifs such as stylised owls, cranes and frogs. When Dresser established the Art Furnishers' Alliance Co. in 1880 production was turned over to Chubb & Sons who also made the pieces designed for Bushloe House that date from this period.

Dresser's designs for brass, copper and cast-iron objects, including candle-holders, lamps, kettles, trays, coalboxes in mixed metals, and cast-iron andirons, fireplace surrounds and hall furniture, formed another essential element of his artistic interiors. His cast-iron furniture illustrates once again his willingness to embrace modern materials and methods of production and included some particularly distinctive coat-stands, hall tables, chairs and benches that featured spiky foliage and angular scrolls combined with elliptical mirrors and roundels. He also supplied elegant fireplace overmantels with ebonised shelves containing his colourful ceramics and glass vases, as well as stained-glass windows in muted and delicate colours containing spiky leaf ornament and Anglo-Japanese motifs. Finally, Dresser recommended that all the frames and curtain poles in the room should be ebonised to complement the furniture and to provide an artistic contrast with the wallpapers and paint colours. Curtains were to be loosely draped from "a simple and obvious pole". Such ideas represented a radical departure from the usual preference for ponderous gilt frames and elaborate curtain arrangements and anticipated the practice of modern decorators. Above all, Dresser aimed to free his furnishings and decorations from the straitjacket of historicism and to create a "new style" which would make "every homestead artistic in the true sense of the word".

Biography

Born in Glasgow in 1834. Enrolled at the Government School of Design, London, 1845. Married Thirza Perry, 1854: 13 children. Lectured at School of Design, Marlborough House, 1854–68; appointed Professor of Botany, 1859; received honorary doctorate from the University of Jena, 1860. Established as a leading commercial designer of ceramics, wallpapers and textiles by mid-1860s; produced designs for metalwork, furniture and cast iron from the 1870s; glass from the 1890s. An authority on Japanese art, he visited Japan at the invitation of the Japanese government, 1876; returned with stock for Tiffany & Co. Founded Dresser and Holme, importers of Japanese goods, 1879; appointed "art superintendent" for Linthorpe Art Pottery 1879–82; established Art Furnishers' Alliance 1880 (closed 1883). Exhibited at many national and international exhibitions including London 1862, 1871 and 1872; Philadelphia 1876; and Paris 1878. A prolific writer and lecturer he was editor of the *Furniture Gazette*, 1880–81, and wrote many articles on ornament, colour and design. Died in Mulhouse, France, 24 November 1904.

Selected Works

A sketchbook of Dresser's original designs, dating from the 1860s, is in the Ipswich Museum, Suffolk; two volumes of tracings from his studio of the same period are in the Victoria and Albert Museum, London; the Metropolitan Museum of Art, New York has an album of 40 coloured designs dating from the 1880s for wallpapers, ceramics, stained glass, textiles, and for the ornamental treatment of plants. Documentation and artwork relating to his designs for ceramics is in the Minton Archive, and the Archive of Josiah Wedgwood & Sons,

Stoke-on-Trent. Further documentation relating to Dresser's work can be found in the Nikolaus Pevsner Papers, Getty Center for the History of Art and the Humanities, California. Examples of Dresser's textiles, ceramics, wallpapers, glass and metalwork are in the Victoria and Albert Museum.

Interiors

- 1870 Allangate Mansion, Halifax, Yorkshire (decorations and furnishings): Thomas Shaw
- 1879–80 Bushloe House, Leicester (decorations and furnishings): Hiram B. Owston
- 1880 Chubb & Son, 128 Queen Street, London (dining room and office furniture): George Hayter Chubb

Dresser produced designs for over 60 commercial manufacturers in England, France and the US. The principal companies with whom he was associated included: ceramics for Minton & Co., Josiah Wedgwood & Sons, Linthorpe Art Pottery, and Old Hall Earthenware Co.; metalwork for Elkington & Co., Hukin & Heath, James Dixon & Sons, and Benham & Froud; glass for James Couper & Sons; textiles for W. & C. Ward, Warner & Sons, Liberty & Co., and F. Steiner & Co.; carpets for John Crossley & Co., and John Brinton; wallpapers for William Woollams & Co., Jeffrey & Co., Frederick Walton & Co., Lightbown Aspinall & Co., John Line & Sons, and Zuber et Cie.

Dufour et Cie.

French wallpaper manufacturers, 1797–1865

The name of Dufour et Cie. dominated French wallpaper production at the outset of the 19th century. The company's early success was based upon its application of Neo-Classical ornament to wallpaper design and coincided with a period when the popularity of the Empire style was at its height. Dufour also became known for its spectacular panoramic or scenic decorations, wallpapers containing large illusionistic and non-repeating pictorial designs that covered the walls of a room with a continuous scene. These decorations were akin to murals or paintings in appearance and, requiring many hundreds, and sometimes thousands of blocks to print, they represented outstanding examples of technical virtuosity the like of which was never rivalled, before or since.

Joseph Dufour was born in 1757, the son of a carpenter, at Tramayes, close to Mâcon in Burgundy, France. Nothing is known about his training, but by 1789 he was based in Lyon. At this time Lyon was the European capital of the silk trade and a principal centre of textile production. It was also an important centre for the manufacture of wallpaper, but wallpaper was still not widely used during this period. Dufour worked for the Ferrouillat factory – a major producer of wallpaper – and he became a partner in 1792. Unfortunately, the business suffered during the revolutionary riots of 1793–94 and closed down in 1797.

Following this event Joseph Dufour set up his own factory in Mâcon later that year in association with his brother Pierre. At the same time he kept certain interests in the Lyon wallpaper business. It seems that Pierre was in charge of the administration of the business while Joseph managed the workshops. They secured the services of Jean-Gabriel Charvet (1750–1829), who was already active in the wallpaper industry in Lyon, to prepare designs and drawings for the block-cutters. The company's figures for 1800 show that it quickly achieved a substantial turnover grossing a total of 119,164 francs. Pierre left the company, which was then registered as Joseph Dufour & Cie, and Dufour's cousin Antoine took over the administrative side.

By 1804 the business was thriving and employed 90 workers, and Dufour issued his first panoramic decoration entitled *Les Sauvages de la Mer Pacifique* (or *The Voyages of Captain Cook*) which was designed by Charvet and sold together with a 48 page booklet describing the different scenes and detailing the exotic flora and fauna. At the same time, a rival manufacturer, Jean Zuber & Cie., launched *Les Vues de Suisse*, and these two panoramic designs were probably the first to be produced in colour. Both decorations were featured at the Exposition des Produits de l'Industrie at the Louvre in

1806 where they aroused much interest and critical acclaim. Dufour's work was singled out for especial praise, with one commentator declaring that "New wallpaper decorated with subjects drawn from Captain Cook's voyages counts perhaps among the most unusual work created in this field." But the Mâcon-produced wallpaper did not win an award, whereas Zuber's decoration received a silver medal.

In 1808 Dufour established a workshop in Paris, at 17 rue de Beauvau in the faubourg Saint-Antoine, an area containing numerous cabinet-makers' workshops and where J.B. Réveillon and his successors had been working since 1763. Dufour appears to have employed Xavier Mader from the time he arrived in Paris. Mader managed the drawing and engraving workshops until 1823 and it was he who introduced the distinctive Neo-Classical look to the company's products which were not widely known until this time. His firm engravings resulted in a style that was as rigorous as it was elegant, and which could be seen as early as 1808 in the classically-inspired series of grisaille figures representing the months (*Les Mois*) drawn by Evariste Fragonard, in the Greek deities that appeared in the *Galerie mythologique* (1814), and in the Empire-style drapery decorations and friezes containing *trompe-l'oeil* representations of ruched and gathered muslin and silks that continued to be produced well into the 1820s.

Dufour's draperies were an extraordinary exercise in verisimilitude and proved popular in many Empire and Biedermeier interiors of the early 19th century, but it was the panoramic decorations which brought the business its great success. Its most notable works included *Les rives de Bosphore* from around 1812, *Les monuments de Paris* (1812–14), and *Psyché & Cupidon* (1815). These last two panoramics were especially original. The first contained a frontal composition and artificially aligned the most well-known Parisian monuments along the banks of the Seine. The second built up a complex narrative in twelve individual tableaux, printed in sepia or grisaille, illustrating scenes in the Cupid and Psyche story. The series was designed by the artists Louis Lafitte (1770–1828) and Méry-Joseph Blondel (1781–1853) and featured elegant, life-size Neo-Classical figures who inhabit palatial marble halls containing carefully rendered Empire-style furniture and ornament and massive architectural features and mosaic floors based on those discovered at Herculaneum and Pompeii. *Les paysages de Télémaque dans l'île de Calypso* (c.1818), *Les Incas* (around 1818) and *Les Fêtes Grecques* (1818) demonstrate the depth and quality achieved artistically, which was recognized when the firm was awarded a silver medal at the Exposition des Produits de l'Industrie in Paris in 1819.

In 1821 Joseph Dufour's daughter married Amable Leroy of Lyon and the name of the company was changed to Joseph Dufour & Leroy in the following year. Xavier Mader left the business in 1823 to set up his own venture. Dufour & Leroy continued to produce panoramic scenes, such as *Paul & Virginie* (c.1824), *Les Voyages d'Anthénor* (c.1820–25), and when Joseph Dufour died on 15 January 1827 his son-in-law continued in the tradition, launching *Les Campagnes des armées françaises en Italie* (c.1829), *Renaud & Armide* (1831) and *Les paysages pittoresques* (c.1832), before selling the company to the Lapeyre & Drouard factory in 1835.

If Dufour's production of panoramic scenes is well known

and demonstrates the creativity and technical and artistic strengths of the business, we are now beginning to be better able to define and to date the rest of the factory's output, thanks to an album of samples in the Musée des Arts Décoratifs in Paris. These samples, together with examples at the Musée du Papier Peint de Rixheim and artwork preserved at the Bibliothèque Forney in Paris, have established the image of a manufacturer totally mastering a rich and sumptuous French Empire style which continued to have popular appeal long after 1815 and which explains the success of the company's output both in France and abroad during this period.

BERNARD JACQUÉ

Selected Works

The major collection of Dufour et Cie.'s wallpapers is in the Musée des Arts Décoratifs, Paris. Additional examples are in the Musée de Papier Peint, Rixheim, Victoria and Albert Museum, London, the Whitworth Art Gallery, Manchester, and the Cooper-Hewitt Museum, New York.

Further Reading

While there is no complete catalogue of work produced by Dufour et Cie., a catalogue raisonné of the panoramic decorations appears in Nouvel-Kammerer 1990 which also includes an extensive bibliography of primary and secondary sources. The most recent English-language survey of their work appears in Hoskins 1994.

Dugourc, Jean-Démsthène 1749-1825

French designer of furniture, textiles, interiors and ceramics

Jean-Démsthène Dugourc was one of the leading French designers of the last decades of the 18th century. He seems to have been responsible for the introduction of a wide variety of delicate styles that became current in the last years of the *ancien régime*, particularly the refined version of the Classical style called the *Style Étrusque*. This was based on discoveries of Classical antiquities at Pompeii and Herculaneum, and tended to eschew the elaborate gilt and bright colours of much 18th-century decoration in favour of severe outlines, sharp profile decoration and sombre colours (especially, yellow and chocolate brown) reminiscent of Greek vase decoration. In addition, Dugourc was particularly important in the designing of three-dimensional objects and the propagation of French styles abroad. However, as he was neither a professional architect nor a manufacturer (except for a short space of time just after the beginning of the French Revolution), his significance has until recently remained largely unrecognized, and has only recently been revealed through documents and the study of his drawings. These latter include an important album of drawings in the Musée des Arts Décoratifs, formerly in the collection of Sir Richard Wallace, and the now-dispersed archive of the silk-weaving firm of Tassinari et Chatel at Lyon, the successor firm to one of Dugourc's long-standing patrons, Camille Pernon.

The basis of all historical research on Dugourc is given by two autobiographies or *mémoires* that he wrote in 1800, just after he had left Republican France, and in 1823, when he was reduced to begging a pension from the Crown. He was born in 1749, the son of a high-ranking official in the household of the Duc d'Orléans, a cousin of the king and owner of the Palais Royal in Paris. He apparently took some lessons with the Duke's son, the Duc de Chartres, later to become famous as Philippe Egalité, who voted for the death of the king in 1793 and was himself executed in 1794. A visit to Rome in 1765, where he encountered Winckelmann, was cut short by the death of his mother, but left him with an abiding love of Classical antiquity. He learnt his proficiency in the arts of painting, sculpture and engraving with the painter and engraver Saint-Aubin, laying the foundations of his skill in draughtsmanship. His first recorded work is an allegory of the marriage of the Dauphin to Marie-Antoinette in 1770, known through an engraving by Ingouf. Throughout his career he seems to have been able to fall back on drawings and engravings of fine art subjects as a sideline to his career as a designer.

In 1776 Dugourc married a sister of the Neo-Classical architect François-Joseph Bélanger (1744-1818), and although she was to die in 1785, Dugourc's relationship with his brother-in-law seems to have lasted until the end of the century, and brought him close to one of the most advanced and innovative of all 18th-century French designers. Bélanger is believed to have re-introduced the arabesque style into interior decoration, and it would seem that one of Dugourc's first decorative commissions was the painting in 1777 of small-scale human and semi-human figures in the arabesque wall decoration of Bagatelle, the pleasure pavilion of the king's youngest brother, the Comte d'Artois. Many of the interiors of

Dugourc: design for a bed in an alcove

Bagatelle were in an extraordinarily refined and fantastic taste, including a bedroom with hangings imitating a military tent complete with a stove in the form of a pile of cannon balls and grenades, and must have had enormous influence on Dugourc's development as an interior designer.

Among Dugourc's earliest recorded designs were interiors in the Chinese taste for the Duchesse de Mazarin, another client of Bélanger, who wanted a suitable setting for her collections of Oriental porcelain. Dugourc also seems to have contributed to theatre design as early as 1779, when he began what he called the "total reform" of theatrical costumes. In 1780 he commenced his long involvement with the royal family when he became draughtsman to the king's younger brother, the

Comte de Provence, and produced designs for the inauguration of the Count's theatre at Brunoy, built to the designs of the architect Chalgrin, including a vestibule painted to imitate a garden surrounded by trelliswork in front of trees. He also produced theatrical designs for the king of Sweden.

By 1781 Dugourc was working with Camille Pernon, an eminent silk manufacturer at Lyon. His designs included wall hangings with decoration in the arabesque manner and others with an out-of-doors character showing birds sitting in trees. Chairs and chair covers with similar decoration complemented these designs. Some of the furniture he designed was made by the leading chair-maker of the day, Georges Jacob, and some chairs made by him for the celebrated hôtel of Mademoiselle

Dervieux have straight legs supporting a frame with an acanthus border, and a general lightness of style that marks a refinement of the heavy Neo-Classicism which had by then become current. In 1784 Dugourc was appointed designer to Garde-Meuble de la Couronne, the organization responsible for the furnishing of the royal palaces, and a set of chairs and a bed for Louis XVI made to his design survive at the château of Compiègne. Dugourc also seems to have provided designs for the famous royal jewel cabinet created for the queen in 1787, and a wax model close to his designs survives in the Walters Art Gallery, Baltimore; the top of this model comprises tall panels decorated with flat Pompeian-type figures in the Etruscan style. He also claimed to have provided designs for ormolu mounts for the gilders Pierre Gouthière and François Rémond, as well as designs for the clockmaker Godon. An important drawing in the album in the Musée des Arts Décoratifs shows an elegant Neo-Classical side table supporting a whole range of ormolu goods, including a candlestick in the form of female terms, identical to a pair now in the Wallace Collection, London.

Much of Dugourc's time in the 1780s seems to have been spent in preparing an amazing range of decorative schemes for royal and aristocratic patrons throughout Europe, few of which were executed, although his drawings survive to show his extraordinary powers of invention. In 1784 he prepared designs for interiors for Catherine the Great of Russia, her son Grand Duke Paul, and General Lanskoï, all of which show extensive use of silk hangings which would presumably have been supplied by Pernon. In 1786 he prepared a whole range of designs for the Spanish Court, including a room in the Gothic taste, complete with tracery, and a Turkish saloon for the palace of the Prado, as well as an Egyptian room and Etruscan gallery for the Escorial. In 1789 he prepared Neo-Classical designs for a Throne Room in the royal palace at Madrid.

Much of Dugourc's patronage naturally fell away at the time of the French Revolution, and he seems to have had difficulty in finding outlets for his extravagant talents. He is recorded as operating a wallpaper factory with Etienne-Alexandre Jacques Anisson-Dupéron, who was guillotined in 1794, and also ran a factory making playing cards in which the Kings, Queens, and Knives were replaced by *Génies*, *Libertés* and *Egalités* according to Republican taste. He also ran a glass factory and produced designs for one of the Paris porcelain factories, about which little is known. However, his capacity for producing luxury items continued, as is shown by his design of 1799 in the Hermitage, St. Petersburg, possibly for the gilder Rémond, for mounting a hard-stone bowl on a frame consisting of four eagles with outstretched wings. Such designs prefigure the severe classical style of Percier and Fontaine.

Dugourc continued to provide designs for the court of Spain, including some of the furnishing in 1799 for the celebrated Casita del Labrador (worker's cottage) at Aranjuez, a garden pavilion, which includes a billiard room hung with silk hangings by Pernon designed by Dugourc based on Raphael's famous arabesque designs in the Vatican. In 1800 he accepted an offer to work for the Bourbon king of Spain, Charles IV, and appears to have acted as a representative at the Spanish court for the firm of Pernon. The war in the Peninsula led to his return to France in 1813, just in time to profit from the

Bourbon restoration of 1814, when he became official designer for public ceremonies. In 1816 he regained his former title of designer to the Garde-Meuble de la Couronne and continued to produce designs for royal occasions and interiors, including the refurnishing of the Throne Room at the Tuileries. He died in Paris on 30 April 1825.

Dugourc's main achievement was to develop the Neo-Classical taste beyond the severe *goût grec* of the 1760s and 1770s into an elegant and adaptable style that did not neglect the possibilities of using other styles – Chinese, Turkish or Gothic – in the creation of fantasy interiors in which every detail contributed to the overall effect of the whole. His willingness to design for manufacturers gave a boost to the prestige of French taste and luxury goods abroad, and helped the propagation of the late Louis XVI style in other countries. It is possible to see in his work both the seeds of the severe Empire style of Percier and Fontaine, with its emphasis on austere decoration based on Roman military emblems, and the fantastic lattice work and Chinoiserie of the Brighton Pavilion in England, the whole prefiguring the stylistic diversity of the 19th century.

HOWARD COUTTS

Biography

Born in Versailles, 23 September 1749, only son of François Dugourc, controller in the household of the Duc d'Orléans. Travelled to Rome c.1765 where he met J.J. Winckelmann; returned to Paris and studied under the engraver Saint-Aubin c.1766. Married Marie-Anne-Adélaïde, sister of the architect François-Joseph Bélanger (1744–1818) in 1776 (died 1785). First decorative commissions, 1777; designed furniture for leading cabinet-makers from late 1770s. Appointed designer to the Comte de Provence, 1780; worked with the Lyon silk manufacturer, Camille Pernon, 1781–90; appointed designer to the Garde-Meuble de la Couronne, 1784; opened a wallpaper factory with Etienne-Alexandre Jacques Anisson-Dupéron, c.1790. Provided designs for Catherine the Great and the Russian court from 1784; and for the Spanish court from 1786; worked in Madrid for Charles IV from 1800; returned to France c.1813; appointed official designer of public ceremonies, 1814; regained former title, designer to the Garde-Meuble de la Couronne, 1816. Petitioned Louis XVIII for a pension, 1823. Died in Paris, 30 April 1825.

Selected Works

Important collections of Dugourc's designs for interiors, furniture and textiles are in the Musée des Arts Décoratifs, Paris, and in the Musée des Arts Décoratifs, Lyon. Both museums also hold examples of Dugourc's furniture and textiles.

Interiors

- 1777 Hôtel de Bagatelle, Bois de Boulogne, Paris (part of the wall decoration; building and interiors by F.-J. Bélanger); Charles Philippe, Comte d'Artois
- c.1777 Hôtel de Mazarin, Paris (Chinoiserie decoration); Duchesse de Mazarin
- 1780 Château de Brunoy (interiors including the theatre and vestibule): Comte de Provence
- 1785 Château de Compiègne, near Paris (decoration of a bathroom and some furniture for the Royal Apartments): Louis XVI
- 1786 Escorial, Madrid (designs for an Etruscan Gallery, Egyptian, Chinese and Turkish rooms): Charles IV

- 1786 Prado, Madrid (designs for a French cabinet, Gothic and Turkish rooms): Charles IV
 1790 Apartment for the Duke and Duchess of Alba, Madrid (designs for interiors)
 1799 Casita del Labrador, Aranjuez (interior and furnishings)
 1818–24 Throne Room, Tuileries (interior decoration and furnishings): Louis XVIII

they provided images of self-representation and were apparently very amusing.

Dummy boards appear to have their origins in early 17th century Holland where artists such as Gysbrechts, van Hoogstraten, and Bisschop produced lifelike cut-outs of everyday objects which were intended to amuse. They could be seen to have derived from the shadowy figures that are sometimes found in the background of Dutch paintings of interiors.

Originally the work of professional painters, by the mid 18th century they were popular enough to sustain the livelihood of many a sign painter. One such painter, John Potts of London, had a trade card with a representation of Queen Elizabeth I, complete with an inscription offering dummy boards for halls, stairways, and chimneys.

The mention of chimney boards gives a clue to some of the uses that dummy boards have been put to within an interior setting. Indeed the painted chimney board designed to fill the

Dummy Board figure, English, c.1690

Dummy Boards and Chimney Boards

Dummy boards are essentially life-size character representations, that were painted onto wooden cut-outs which were designed to be self-supporting. The cut-out dummy board figures appear to be descended from the traditions of *trompe-l'oeil* and illusionistic painting. They are part of a tradition of representation that showed reality as an illusion. In addition,

fireplace during the summer months is a very close relative of the dummy board. While this seems an eminently practical purpose, the use of dummy boards in halls and stairways is more ambiguous and many fanciful reasons have been put forward for their use. Possible explanations for the dummy board have included their use as aunt sallys and fairground targets; to provide an image of a security guard in an empty house; to act as door stops; to double as firescreens, and to act as silent companions. There may be a grain of truth in many of these suggestions.

Although there are many different types of dummy boards, they can be classified under several headings to help explain their use. The first group are single figures. These were generally of full-size women, children or men. The dress and accompanying accessories often indicate status. A maid might have a broom or kettle, while a child might be holding a toy. Wealthy images were depicted by their dress or fashionable accessories. The use of single figures was explained by the Dutch painter Houbraken. He said the idea of a dummy board was so that a silent companion would be a presence in an empty space. Houbraken intended them to be placed in a corner of a room or at the end of a vestibule so that they appeared to greet someone, just as a living person might.

The second group could be called "sweeping maids". Interestingly, although they often seem to represent a maid, upon closer examination they can be found to be a lady in sumptuous clothes underneath a servant's apron. An early example from the inventory of Cobham Hall (1672) lists such an item as "piece of ye Dutchesse of Richmond at length cut out". Some of the most attractive examples are designed as pairs. These were often of children, usually a boy and a girl, which are sometimes oddly displayed standing in front of a fire grate.

The third group are soldiers dressed in full uniform. It is likely that they were used for recruiting purposes, but examples have been used in domestic interiors. It is recorded that a dummy English grenadier provided much amusement in 18th-century Philadelphia by frightening visitors in a particular home.

The fourth group are low-life characters produced in the latter half of the 18th century for use in public pleasure gardens, and for outdoor entertainment. Similar examples of animals were also used in private gardens, again for providing amusement.

From these descriptions it can be seen that dummy boards provided examples of indoor entertainment as well as exemplifying a continuing fascination with questions of illusion and reality, and materialism. In terms of interiors, they were clearly a successful component, as not only were they valued in the 17th and 18th centuries, but were revived in the mid 19th century, and again in the 1920s and 1930s. Even in the contemporary interior, their decorative value has been acknowledged.

Not to be confused with dummy boards, but often seen as similar, are painted chimney boards. Used from the mid-17th century, these were fitted panels that would fill the fireplace void during summer months when the fire was not in use. They not only improved the appearance of the fireplace, but also

acted as protection against falling soot and draughts. Either made from boards or panels in a similar way to dummy boards, or painted on stretched canvas like pictures, they were ideally suited for painted decorative treatments. Some often featured simple motifs of objects, such as flowers and plants, while others might be painted to match the decor of the room. Yet others represented an animal, a child, an oriental, or a pastoral scene.

Examples are not uncommon in America, but in England there are relatively few survivors. In Osterley Park House chimney boards exist for the fireplaces in the Taffeta bedroom and the Etruscan room, both being decorated en suite. At Audley End House, the Adam rooms also have chimney boards which clearly form part of the original decoration of the rooms.

In France, the chimney board was known as a *devant de cheminée*. Famous painters have produced such fine examples that they have sometimes been framed and presented as easel paintings rather than the chimney board they started life as: Chardin's *The White Table-Cloth*, Oudry's *Dog with a Porcelain Bowl*, and Tessier's *White Porcelain Bucket* are fine examples of the genre of illusionistic painting applied to the chimney board.

E

Eames, Charles 1907–1978

American architect and designer

Architect and designer Charles Eames and artist Ray Kaiser teamed up together at Eliel Saarinen's Cranbrook Academy in Michigan in 1940, where Ray had come to study weaving and where Charles had been appointed head of the Department of Industrial Design. They were married the following year, the start of a unique creative collaboration which would continue until Charles's death in 1978. While each had their own areas of expertise – Ray in the fields of painting, sculpture, graphics and textile design; Charles in the fields of architecture, three-dimensional design and technology – the fruits of their partnership, which included films, exhibition design and toys, as well as furniture, architecture and interior design, were the direct result of the creative energy which arose from their personal and professional relationship.

Charles Eames came to prominence in 1940 after winning first prize with Eero Saarinen in the Museum of Modern Art's "Organic Designs in Home Furnishings" competition. This led to further experiments with moulded plywood, which the Eameses realised had tremendous potential for embodying organic, sculptural, curvilinear forms. War-related work designing plywood splints, litters and gliders led directly to the design of plywood furniture after the war, produced initially by the Molded Plywood Division of Evans Products Company in Venice, California, from 1945–46, but subsequently manufactured from 1947 onwards by the Herman Miller Furniture Company of Zeeland, Michigan. The Eameses' plywood chairs were revolutionary technically, aesthetically and ergonomically, and they rapidly became icons of modern American post-war design. The chairs were produced in two different heights – a dining chair and a low lounge chair – and with two alternative frames, either plywood or tubular steel, hence the codes. Brought to public notice as a result of an exhibition called "New Furniture by Charles Eames" held at the Museum of Modern Art (MOMA) in 1946, the chairs were greeted with enthusiasm by Contemporary architects such as Richard Neutra because, with their lightweight frames and sculptural forms, they perfectly complemented the new open-plan domestic interiors of the day. Quality of manufacture and attention to detail were hallmarks of Eames's designs for Herman Miller, and the plywood series was distinguished by its attractive and

sometimes exotic veneers, which added colour and pattern to sculptural form. The chairs were followed in 1946 by a wavy plywood folding screen, and by a series of circular, rectangular and square tables, the latter with folding metal legs, all distinguished by the way in which they successfully united functionalism with expressive shapes.

In 1948 Charles Eames entered another MOMA-sponsored event, the International Competition for Low-Cost Furniture, and it was this which led to the development of his moulded plastic shell chair, produced from 1950 onwards. The chair was originally conceived as being manufactured from stamped metal components, but when this material and method of production proved impractical, the designer teamed up with Zenith Plastics. This resulted in the development of a lightweight moulded fibreglass and polyester shell which sat on either tubular steel legs or sculptural steel rod understructure, available in a variety of combinations, including a rocking chair version. The plastic shell had integral colouring and was produced in a variety of shades; it could also be padded and upholstered. Both armchair and sidechair versions were produced, the resulting series being extremely versatile, suitable for both domestic and commercial interiors, as well as public buildings such as schools.

The plastic chair was followed shortly afterwards in 1951 by the wire mesh chair, not dissimilar in its aesthetic to Harry Bertoia's wire *Diamond* chair for Knoll, Herman Miller's main competitor in the field of Contemporary furniture. The wire mesh chair was produced with the same range of bases as the plastic chair, including the wire structure known as the *Eiffel Tower*. Its sculptural origins were clearly expressed through its form and its open wire mesh structure. Like Eames's earlier designs, the wire chair was not only practical but highly photogenic, particularly when photographed en masse in arrangements and groupings which emphasised its status as a work of art as well as a piece of furniture. As the Eameses themselves were responsible for overseeing the firm's publicity photographs, for the graphic design of their advertisements and even for the design of the company's showrooms, this meant that they exerted a large degree of control over the identity with which their products were associated. When a customer bought an Eames chair for their office or home, they were buying an image as well as an object. Although by comparison with some of the more mannered and exaggerated Contemporary furniture on the market during the 1950s,

Eames: interior of Case Study House no. 8, 1940s

the Eameses' designs were relatively understated, they made a significant visual contribution to the interiors in which they were used, and they were widely employed by other architects.

The influence of the Eameses on interior design is not limited to furniture, however. In 1945 they had been asked by John Entenza, editor of the influential Los Angeles-based *Arts and Architecture* magazine, to contribute a design to the Case Study House programme that the magazine was promoting after the war. Ray Eames designed many of the covers for *Arts and Architecture* during the late 1940s, and the magazine itself served as a vehicle for the progressive ideas of the Eameses and their circle. In addition to working with Ray on the design of their own house (Case Study House no.8), Charles Eames also collaborated with Eero Saarinen on the design of a house for John Entenza (Case Study House no.9). The Eames house, completed in 1949, was and still is hugely influential, both as a piece of architecture and as a personal statement by the Eameses about their outlook on life. It is a steel framed structure built on a modular grid system using mass-produced off-the-peg industrial components. The steel structure, which includes some diagonal cross-bracing, is left exposed on both the interior and the exterior, and is clad with a mixture of glass and cement panels. The exterior is black and white with blocks of bright pure primary colours in red, yellow and blue. Interior walls juxtapose tongue and groove wooden cladding with large flat veneered plywood panels, and areas of painted plaster, the steel joists and decking of the roof being left exposed on the ceiling. In some ways, therefore, the house was an early example of high-tech, although the way in which the interior was decorated and furnished was highly idiosyncratic and represented a unique expression of the Eameses' personalities and interests.

Ray's abstract paintings were suspended from the walls and the ceiling of the dramatic double height living room; vinyl tiles were laid on the floor, on top of which were placed Japanese *tatami* mats and wool and animal skin rugs; Charles's furniture was also dotted around. However, the main impact within the interior was the eclectic collection of multi-cultural artefacts and found objects, both natural and man-made, carefully arranged throughout the house. These gave the house an exuberant and celebratory atmosphere, and set the interior ablaze with pattern and colour. The Eames house was recorded by the couple themselves in their fascinating short film, *House: After Five Years of Living*, made in 1955. The film, which is composed of a kaleidoscope of still images of views and close-ups compiled from hundreds of 35mm slides, is accompanied by music by Elmer Bernstein. There is no commentary; the slides follow the sequence and the rhythm of the music, the effect being highly poetic. It was through this film that the creativity of the Eameses in its fullest sense reached a wider audience, and in particular their unique way of combining art, architecture, design and film.

Charles Eames's partnership with Herman Miller continued for many years, so that over time the name of the company became almost synonymous with that of its leading designer. His later designs included the luxurious *Lounge Chair* and *Ottoman* of 1956, with its plywood rosewood veneered frame and cushioned leather upholstery; and the *Aluminium Group* of 1958, a series of chairs with cast aluminium frames across

which specially designed plastic cloth was stretched. In addition to chairs, Eames also designed storage furniture, including a flexible, modular, knock-down storage system called the *Eames Storage Units* (ESU), produced from 1950. This highly functional steel angle-framed system had an industrial aesthetic, and was equally suitable for the office and the home. A choice of decorative plastic-coated panels (available in black, white and primary colours) and veneered or dimpled plywood panels could be installed, the varied visual effects of which gave the units a cheerful appearance. Within this basic framework, cupboards, drawers and shelves could be inserted in a variety of configurations and, as on the Eames house, exposed cross-bracing was used as part of the structure and as well as an element of the decoration. As with so many of the Eameses' designs, ideas derived from this system were widely adopted by other manufacturers during the ensuing decades, so their influence on the post-war interior was both direct and indirect.

Biography

Charles Ormond Eames, Jr. Born in St. Louis, Missouri, 17 June 1907. Awarded an architectural scholarship, Washington University, St. Louis, 1925–28. Married 1) Catherine Davey Woermann, 1929 (divorced 1941): one daughter; 2) Ray Bernice Alexandra Kaiser, 1941. Visited Europe and saw the work of Modernist architects Mies van der Rohe, Walter Gropius, Le Corbusier and Henry van der Velde, 1929. Active as an architect, in partnership with Charles M. Gray and Walter E. Pauley, St. Louis, 1930–34. Travelled and worked in Mexico, 1934–35. Returned to St. Louis, and resumed architectural practice in partnership with Robert T. Walsh, 1935–36. Designed furniture and architectural fittings from mid 1930s. Awarded fellowship in architecture and design, Cranbrook Academy of Art, Bloomfield Hills, Michigan, 1938; instructor in design, 1939; head of Department of Industrial Design, 1940. Moved to Los Angeles, and established architectural and design practice in partnership with his wife, Ray, 1942–45; practice moved to Venice, California, 1945–78. Formed Molded Plywood Division of Evans Products Company, Los Angeles, 1944; employed as consulting designer by the furniture manufacturers, Herman Miller Inc., Los Angeles, from 1947. Active in exhibition design from 1949; involved in film-making from 1950. Lecturer, California Institute of Technology, Pasadena, 1953–56; Charles Eliot Norton Professor of Poetry, Harvard University, Cambridge, Massachusetts, 1970. Received numerous prizes and honours including Gold Medal, American Institute of Architects, 1957, Elsie de Wolfe Award, with Ray Eames, American Society of Interior Designers, 1975, and Gold Medal, Royal Institute of British Architects, 1979. Fellow, Royal College of Arts, London, 1960; Member, American Academy of Arts and Sciences. Died in St. Louis, 21 August 1978.

Selected Works

The Eames Archive, containing an extensive collection of letters, drawings, photographs and films, is in the Library of Congress, Washington, DC. Notable holdings of Eames's furniture are in the Museum of Modern Art, New York, and the Philadelphia Museum of Art, Philadelphia.

Eastlake, Charles Locke 1836–1906

British design theorist and architectural historian

Although he trained as an architect, Charles Locke Eastlake never actually executed any buildings and his chief claim to fame was as a theorist and author. His *History of the Gothic Revival*, published in 1877, still remains an important treatise in the study of Gothic architecture, while his earlier publication, *Hints on Household Taste* (1868), was arguably the most significant of many contemporary books on decoration and design. A combination of philosophical and practical advice, this book set stylistic standards in the production and consumption of domestic furnishings and was hugely influential on both sides of the Atlantic. Indeed, it was so popular in the United States that, by 1886, it had been reprinted seven times.

Hints on Household Taste represented an expanded version of articles previously published in the early 1860s in the British journals *Cornhill* and *Queen*. In it Eastlake attempted to lay the foundation for an understanding of good design that would establish criteria for discrimination and taste. "If I am thus enabled," he wrote in the introduction, "even indirectly, to encourage a discrimination between good and bad design in those articles of daily use which we are accustomed to see around us, my object will be attained". And by this exercise of taste the "recent degradation" that he perceived in English manufacture could be halted and reversed.

Eastlake's approach to the design and style of furniture and interiors was clearly much influenced not only by the writings of mid-century Gothic Revivalists such as A.W.N. Pugin and John Ruskin, but also by those of a second generation of designers and critics including Bruce Talbert, G.E. Street and Owen Jones, all of whom argued for honesty of construction and propriety of ornament in the design of furnishings. Building on these ideas, Eastlake codified the basic tenets of "good design" as simple, functional forms, honesty in construction, and ornamentation that is subordinate to the object. His belief in the fitness of form to function was reflected in his view that "To fulfill the first and most essential

principles of good design, every article of furniture should, at first glance, proclaim its real purpose", while his emphasis upon simplicity arose from a belief that "The best and most picturesque furniture of all ages has been simple in general form ... Its main outlay was always chaste and sober in design, never running into extravagant contour or unnecessary curves". Ornament was not completely disavowed, but he contended that it should be appropriate to both the form of the object that it decorated and the material out of which it was made and so indicate "by its general character the material that it enhances". Nevertheless, he did not recommend a slavish following of these theories but advocated some flexibility, if necessary, in order to achieve a pleasing design, declaring that "a little alteration in the details gives a picturesque character to such articles of furniture".

Eastlake designed only a few pieces of furniture himself which were made up for him by the London cabinet-makers Jackson and Graham. Much of this work was sturdy and rectangular in shape and loosely derived from medieval prototypes. Decoration was generally limited and was confined to details such as incised lines, geometric patterns, shallow carving and functional yet decorative metalwork accessories such as Neo-Gothic strap hinges. In comparison with the high finish and complex carving found on most commercial cabinet-makers' work, Eastlake's designs appeared remarkably severe and a particularly robust-looking cabinet was likened to a rabbit-hutch by a caricaturist in the satirical magazine *Punch*. Nevertheless, the Eastlake style was widely imitated by many more progressive firms, and several American manufacturers, notably Herter Brothers and Kimbel and Cabus from New York, and Daniel Pabst of Philadelphia, were influenced by his work.

Eastlake's line drawings of furniture in the first editions of *Hints* clearly favour the Modern Gothic style derived from the work of architect-designers such as G. E. Street, Norman Shaw, and J. P. Seddon and subsequently popularised in Bruce Talbot's *Gothic Forms Applied to Furniture* (1868). In later editions, Eastlake substituted other styles such as Elizabethan and Anglo-Japanese, explaining that "artistic taste in the 19th century [is based] upon eclecticism rather than one tradition". Thus, although he admired the integrity of medieval furniture, he believed his theories could be applied to any kind of furniture and his philosophy of design emphasised a generic canon that could be used to conceive a number of fashionable styles.

Although he argued for the unification of the arts and crafts, unlike many reformers Eastlake did not totally eschew the use of machines but he did "deplore ... the misapplication of machine technology to create a surfeit of tasteless ornamentation" (Madigan). Nevertheless, the rectilinear outlines and incised decoration that were seen as characteristic of his designs were easily married to machine technology, and furniture factories, especially in the midwestern United States, were quick to adopt Eastlakean forms and to advance them using the author's name. Indeed, the word "Eastlake" became so closely coupled with mass-produced – and often inferior – furniture that Eastlake felt himself compelled to discredit this association, declaring in the fourth edition of *Hints*, "I find American tradesmen continually advertising what they are pleased to call 'Eastlake' furniture, with the production of

which I have had nothing to do, and for the taste of which I should be very sorry to be considered responsible".

Much of *Hints on Household Taste* is taken up with the discussion of contemporary furniture, but the book was also a practical treatise that addressed home decoration in general. "There is no reason", Eastlake wrote, "why true principles of design should not be found in the humblest objects of household use" and to help his readers achieve this, he advised on every element of the interior, ranging from the choice of furnishings appropriate to particular rooms to specific items such as tableware, ornaments, picture frames, ceramics, metalwork and upholstery. He also praised the work of particular firms, recommending encaustic tiles by Maw & Co., furniture by his own cabinet-makers Jackson and Graham, and the wallpapers by Jeffrey & Co., and he was one of the first to publicise the merits of wallpapers by the decorators Morris, Marshall, Faulkner & Co. His views on pattern were especially influential. He emphasised the importance of flat patterns for two-dimensional surfaces such as walls and floors, advocating simple, unshaded designs containing conventionalized flowers and foliage that would "neither belie their flatness nor solidity". His own wallpaper, *Solanum*, produced by Jeffrey & Co., adheres admirably to these precepts and contains a trailing fruit and foliage pattern that appears to be indebted to Morris's designs.

Addressed to an upper-middle class, non-specialist readership, *Hints on Household Taste* proved extremely popular in England and was reprinted three times before an American edition was available. Its impact in the United States was unprecedented. Acceptance of the Aesthetic Movement in America was materially inspired by the book, and its author was championed as a leading arbiter of artistic taste. A host of similar books on domestic decoration and furnishing followed in its wake and Eastlake's writing influenced many other authors, such as Clarence Cook, author of *The House Beautiful* (1878), and Harriet P. Spofford, author of *Art Decoration Applied to Furniture* (1877). The seminal nature of its significance was highlighted by Spofford who declared, "Not a young marrying couple who read English were to be found without *Hints on Household Taste* in their hands, and all its dicta were accepted as gospel truth".

Biography

Born in Plymouth, 11 March 1836, the nephew of the painter Sir Charles Lock Eastlake PRA (1793–1865). Articled to the architect Philip Hardwick; studied at the Royal Academy Schools and awarded Silver Medal for drawing, 1854. Married in 1856. Travelled extensively in Europe between 1856 and 1859. Exhibited architectural projects at the Royal Academy, London, 1855–56, but never practised formally as an architect; worked as administrator and journalist after this date. Appointed Assistant Secretary to the Royal Institute of British Architects, 1866; Secretary, 1871–78; Keeper of the National Gallery, London, 1878–98. Regular contributor of articles on decoration and design to the *Cornhill Magazine*, the *Queen*, and the *London Review* in the 1860s; published his most influential work, *Hints on Household Taste*, in 1868. Designed a small number of wallpapers, furnishings and interior fittings from the late 1860s. Fellow, Royal Institute of British Architects, 1869. Died 20 November 1906.

Selected Works

Eastlake's main impact was as an arbiter of taste but he designed a small amount of furniture for Jackson and Graham, and wallpapers for Woollams, and Jeffrey & Co., examples of which are in the Victoria and Albert Museum, London. Manuscript material relating to Eastlake is in the library of the Royal Institute of British Architects, London.

Publications

Hints on Household Taste, in Furniture, Upholstery and Other Details, 1868; 4th edition 1877; reprinted 1969
A History of the Gothic Revival, 1871; edited by J. Mordaunt Crook, 1970
Lectures on Decorative Art and Art-Workmanship, 1876
The Present Condition of Industrial Art, 1877

Eastlake's articles on furniture and decoration for the *Cornhill Magazine*, the *Queen*, and the *London Review* were recast and reissued in *Hints*, 1868.

Edinburgh Weavers

British textile manufacturers, 1929–1963

Edinburgh Weavers was established as an experimental subsidiary of Morton Sundour Fabrics in 1929. Although only based in Edinburgh for two years – the firm was subsequently based in Carlisle – the name was maintained as it remained

synonymous with raised standards of design for household furnishings. Alastair Morton first became involved with the venture in 1932 and was soon its artistic director and chief designer. A painter and a convinced Modernist, he set out to apply modern thinking to textile design and interior design as a whole.

Coming from a family firm with a long-standing devotion to the manufacture of top quality materials, Morton envisaged that Edinburgh Weavers would provide furnishing fabrics to complement modern developments in architecture. Many traditional fabrics were completely unsuitable for modern interiors and nullified the carefully conceived schemes. Progressive architects were demanding fabrics that would enhance their stark interiors and the architectural press regularly carried articles which blamed uncaring manufacturers for failing to comprehend their needs. At this time a number of fine artists were also promoting the need for a greater unity between art and design; in particular they felt there could be a greater harmony between modern architecture and abstract art. They thought that by designing textiles that embodied the same visual values as Modern Movement architecture they would obviously be in keeping with modern interiors. Morton was aware of these developments and consequently always used the most interesting professional designers and fine artists: those who had devised a new aesthetic language appropriate for an increasingly industrialised society. By offering them an opportunity to engage with industry and work in a different medium he presented them with new forms of stimulus while he gained fresh design ideas.

The year 1937 was a crucial one for the firm. In October Morton launched a range of "Constructivist Fabrics" to an interested and intrigued London press. This range became the most outstanding achievement of Edinburgh Weavers' pre-war days and was a unique experiment in textile manufacturing. Morton's understanding of the most progressive art trends greatly influenced his work in textiles; in particular it conditioned his choice of artists to design for him. They would initiate visual ideas which he would develop into a fabric. Designs by Ben Nicholson, Barbara Hepworth, Ashley Havinden and others, were transformed into richly textured woven fabrics. These particular artists were chosen because their work embodied principles of modern design, showing the same rhythmic balance of pure forms. Some of the artists, notably Nicholson, felt the need to combine art with daily life; by offering artists the opportunity to design for mass-production Morton felt he was helping to satisfy that need. The fabrics designed by Ben Nicholson and Barbara Hepworth were considered to be way ahead of their time and were acclaimed as a breakthrough in textile design.

Nicholson's design *Vertical* was considered to be still worthy of production after World War II. Nicholson took infinite care in proportioning his designs, building them up in the same manner that he used to develop his paintings. He was meticulous when conceiving their tonal values and textural contrasts; possessing a clear conception of the way a textile differed from other visual forms, he could accurately visualise how the finished cloth would look in use. *Vertical* was a woven rayon and cotton damask and was produced in three separate colour versions and white on white. In varying tones of white the main body of the cloth contained sections that were

bounded by contrasting weaves and textural yarns. The whole piece was vertically traversed by a widely spaced satin stripe of either red, blue, or green. At the time it was stated that the all white version epitomised that subtlety of contrast in the surface texture for which Edinburgh Weavers was acclaimed.

Morton had a thorough understanding of the weaving process, and it was his interest in the surface texture of the fabrics which gave Edinburgh Weavers its hallmark. He believed it was unnecessary for the commissioned artist to have any knowledge of cloth construction since this was the realm of the specialist weaver. When faced with an artist's design Morton would sometimes contemplate it for weeks before he felt ready to translate it into cloth. He had the ability to hand weave and combined the best of craftsmanship with the cost-effective benefits of the machine. When necessary he could spin the yarn by hand in order to gain the effect he sought, which might be three-dimensional or transparent. He often used hand-weaving as he felt it was a vital transitional stage in the evolution of an industrially produced textile. Morton's combined talents as a designer, painter, craftsman and manufacturer equipped him particularly well to translate the ideals of the Modern Movement into textile design. He insisted that handling the materials was a vital stage in production and certainly there was no rigid, mechanical appearance about these fabrics. Edinburgh Weavers produced numerous magnificent textiles that were machine made versions of Alastair's hand-weaving.

Like his father, James Morton, he believed there should be a truly modern style in furnishing fabrics, and by the end of 1937 Edinburgh Weavers had established an enviable reputation in this field. The *Constructivist* range was considered to have placed furnishing fabric onto the same level as painting and architecture. The firm also used top designers to produce a range of knotted carpets in avant-garde designs.

After the war years and following a lull in trade, a revival in the firm took place. This phase is characterised by a greater inventiveness and boldness of design. A wide variety of artists became interested in Morton's ability to translate the essence of their work into woven or printed patterns, whatever the medium of their original idea. Artists who collaborated with him included Elisabeth Frink, Hans Tisdall, Keith Vaughan, and Joe Tilson. The textiles of the 1950s show evidence of an increased awareness of the possibilities of colour: the result of more sophisticated dyeing techniques combined with striking developments in the fine arts of that period.

As a result of working with many distinguished artists, Morton had a very clear idea of how he thought things should be done. By 1939 Edinburgh Weavers was far ahead of any producer of contemporary fabrics in Britain. His range of exciting fabrics won him the greatest recognition both at home and abroad: he was elected a Royal Designer for Industry in 1960 and Edinburgh Weavers won major design awards both for their woven and printed textiles. In the 1960s the firm was taken over by Courtaulds.

BRENDA KING

Selected Works

Collections of textiles produced by Edinburgh Weavers are in the Scottish National Gallery of Modern Art, Edinburgh, the Victoria and Albert Museum, London, and the Whitworth Art Gallery,

Manchester. Additional examples, artwork and archival material relating to the firm are in Courtauld's Textile Design Library, Courtauld's Textiles, London.

Egypt, ancient

Protected by water and sand, Ancient Egypt was little subject to outside influences; conservative, it recapitulated the basic patterns of its buildings, space planning, furnishings, and decoration through the millennia. Its building forms reiterated the past, even when new materials would have permitted a different expression.

Because forests were exhausted early in Egyptian history, pre-dynastic dwellings were built of vegetal materials: columns of lashed papyrus, roofs of palm leaves, walls hung with woven mats, the whole sometimes sealed with mud. The pressure of the mud-reinforced roofs probably produced an outward roll at the top of the thin reed walls, a concave quarter-circle that would later be recapitulated in stone as the characteristic "gorge" cornice known as a *cavetto* or bird's beak. By the time of the Old Kingdom, plant materials were largely replaced by sun-dried bricks, a material used for hovels and palaces alike. Strength was provided by limestone lintels. To prevent displacement from this load, walls were made thicker at the bottom than at the top, or "battered." This resulted in exterior walls which slanted outward from top to bottom, a shape which was also translated into stone construction. Vertical support was provided by lashed papyrus or by palm tree trunks tied together for greater strength, which produced the effect of vertical convex ribs, or "reeding." This, too, was often imitated in stone pillars, although it could be reversed (fluted) or even omitted if the column were to be enriched with carving or painting. In addition, papyrus flowers and buds were conventionalized as capitals, the first forming a bell-shaped or "campaniform" capital (which has also been interpreted as a cluster of palm branches), the second resembling a long and somewhat sagging cap. Both types are represented in the Hypostyle Hall of the Great Temple of Ammon, at Karnak in Thebes, built during the New Empire.

By the time of the New Empire, temples had become elaborate walled complexes that used site and scale to induce a feeling of reverence in worshippers. Plans varied, but in general the temple, with its façade of immense, slope-sided pylons, was approached from a broad axial walkway delineated by rows of columns or sphinxes. Behind the pylons was an open and colonnaded court which led to a hall dominated by immense, closely set columns. Chapels and ritual rooms were located to the rear of the rectangular or L-shaped structure. The areas within the temple were stepped down in height to provide clerestory lighting; skylights were also used. Columns and walls were generally decorated with bas-reliefs, incised carving, or brightly painted motifs outlined in black.

Residences were composed of interlocking or adjacent rectilinear spaces. In cities, where land was scarce, dwellings could be three storeys high. Country properties expanded horizontally behind protecting walls of mud-brick, a watchman's lodge set near the gates. Within these walls, the self-sufficient estate consisted of living quarters, service areas, a chapel, and gardens. Service areas, such as the kitchens, bakery, brewery, servants' quarters, and storage cellars, were to the rear of the house. Separate structures were provided for granaries, stables, cattlesheds, kennels, and workshops for carpentry and spinning. The main dwelling unit, zoned into public and private areas, was entered through an antechamber leading to a reception area, the ceiling of which was raised above adjacent rooms on painted columns to provide clerestory lighting on one or more sides. Window openings elsewhere were generally small and high, in order to limit the heat and glare of bright sun. The adobe walls were probably plastered and painted with colors derived from plant and mineral materials in hues that included earth tones (rust, henna, bone, dull gold, and brown), light and dark green, light and dark blue, soft purple, bright yellow, and pink. Decorative painting was applied to columns, and entryways accented with painting or carving. Except in public rooms, where mosaics might be laid, floors were likely to be of beaten earth, sometimes covered with mats woven of reeds or palm fiber. Private areas consisted of drawing rooms, bedrooms, and sanitary facilities that included toilets, shower rooms, and spaces for oiling and massage. Stairwells led to a roof-top loggia that provided additional space for work, relaxation, and sleeping.

Of the three types of tomb built for both royal and wealthy Egyptians, the earliest was the walled or underground *mastaba*, built to simulate a house plan, with a central area for the sarcophagus and smaller rooms for funerary offerings. Increasing concern for the security of the remains led to the development of pyramid and rock-hewn tombs, whose interior space planning was limited to an elaborate system of long, low corridors, the principal corridor leading to chambers for the caskets and funeral furniture. In all tombs, hieroglyphs and scenes of ritual and daily life executed in paint, incised carving, and bas-relief filled the walls and ceilings.

Free-standing furniture was uncommon, the floor or built-in platforms being used for most sitting and sleeping. Tomb furnishings and decorations tell us, however, that two types of stool had evolved by the beginning of the Old Kingdom (?2700–?2150 BC), one woven of papyrus (wicker construction), the other made of wood and given a low back. By the New Empire, stools with straight, simply turned legs were also

seen. These were strengthened with stretchers and accented with struts set in a pattern that combined straight and angled pieces.

Folding stools were introduced in the Middle Kingdom. The frame was generally mortised, and the cane or rush seat was sometimes covered with a loose cushion that could be covered in woven cloth, rush, leather, or skins. Wooden seats that were "scooped" or "dipped" to imitate the shape of earlier, leather sling-seats appeared during the New Empire; their X-shaped frames were stabilized by low stretchers similar to sled runners, and carved to end in the form of animal legs and paws, or a duck's head. Surface decoration was usually painted, although inlay in ivory, ebony, and the pottery-like faience was also seen; patterns included frets, chevrons, and a range of highly stylized motifs derived from nature, such as papyrus and lotus flowers or leopard skin.

Armless chairs, and box-like armchairs, often with backs and arms of equal height, were common by the Middle Kingdom (?2040–?1670 BC). Variations in the seating heights of stools and chairs occurred in all periods, but this was especially true of the New Empire, when 9-inch high seats were popular. Royalty, however, sat on high-legged chairs, supporting their feet on footstools. Chairlegs were typically in the form of an animal's front and back limbs, particularly those of the lion and jackal; these were usually raised on pegs, perhaps so that they might appear to rest on (rather than disappear into) a floor mat. Such chairs often incorporated the same stretcher-and-strut designs used on straight-legged stools. Seats were usually flat but could be scooped like those of folding stools. Chairbacks were raked, the angle reinforced by vertical supports that ran from the rear of the seat to the back of the top rail; as construction techniques improved, some seatbacks were even given a slight concavity. Comfort was increased by thick pads, upholstered and made long enough to curl over both the top rail and front seat rail. Again, painted and inlaid decoration were used; and pieces intended for royalty could be gilded.

Beds were more likely to have a footboard than a headboard, and tended to slope downwards toward the floor. The sleeper's head was supported on a U-shaped wooden headrest attached to the frame. Legs could be simply turned or, like seating pieces, carved in the form of front and rear animal legs. Hinged beds made to fold in the middle had developed by the New Kingdom (?1570–?1080 BC) period, and indicate a more peripatetic lifestyle.

Round, oblong, or square tables were supported on three or four legs. Storage was provided by woven baskets; various sorts of chests, some on high legs, like tables; and by small, wooden caskets. Tops were lifted into place and secured with a leather thong wrapped around a large-headed peg.

Because it was difficult to obtain planks of lumber, craftsmen made wooden furniture by joining many small pieces of wood. Species ranged from the domestic acacia and sycamore-fig to the imported tamarisk, cedar, cypress, juniper, ebony, yew, and olive. Mortise-and-tenon joints might be protected with copper sheathing, as they were on the tomb furniture of Queen Hetephras, which is totally covered in gold leaf. These pieces, now in the Cairo Museum, included a bed, throne, and storage box, assembled under a collapsible canopy. Furnishings made of vegetal materials were woven or coiled. Decorative

techniques included inlay, painting, gilding, carving, veneering, and turning.

Linen-making was practiced from predynastic times. Improved methods of spinning and weaving, including an upright loom, were introduced at the end of the Middle Kingdom, but even early linens have a weave so fine they can be mistaken for silk.

Egypt was rich in copper and gold, the latter naturally alloyed with varying amounts of silver and electrum, and its craftsmen showed considerable skill in making both decorative and utilitarian objects from these metals. Bronze was not introduced until the New Kingdom, and Egyptians made little use of iron. The New Kingdom developed the art of coloring gold in tones ranging from pink to crimson.

Hand-built pottery produced in predynastic times is sometimes thought superior to that made on the potter's wheel, a technique introduced at the beginning of the Old Kingdom. Egyptian ceramicists are perhaps best known for faience – a pottery-like substance made of crushed quartz that could be cast, carved, shaped, and fired. The first faïences were blue or green in color; white, yellow, violet, red, and black glazes were eventually developed. Highly sophisticated glassworking appears in the New Kingdom, when glass was cast to imitate semi-precious stones for inlay in jewelry and furniture. Even in predynastic times, vases were made of stone, and these became increasingly common after the introduction of the hand-cranked lathe known as a flintborer. Decorative stone vessels were produced from alabasters, porphyries, breccias, and diorites selected for their attractive formations; some were carved to imitate leaf forms.

Many motifs, particularly the geometrics, were either purely ornamental or, like the spiral – associated with Thoth (the ibis-headed god of truth) and symbolizing the breath and spirit – were so stylized that their symbolic content was subordinate to their decorative value. Among those that retained symbolic importance were animal forms associated with gods, such as the hawk-god Horus or Anubis the jackal; the ankh, which was a symbol of life; the aten, or sun-disk, sometimes depicted with rays ending in human hands; lotus and papyrus blossoms, which denoted Lower and Upper Egypt, respectively; and the winged globe, which was associated with Horus and served as a symbol of protection. Such motifs reflect the integration of the earthly and the eternal in Egyptian culture. Religion – particularly the belief in an afterlife that was a continuation of life on earth – was of primary importance to Egyptian art and architecture. The need to provide kings with resting places worthy of the gods they were assumed to be led to the design of the pyramids that characterise the period. The assumption that images had the power to bring about events caused both king and subject to fill burial chambers with favorite possessions, and render every surface with carved and painted images of activities they wished to occur in the hereafter.

Peculiar to the culture that evolved it, Egyptian design has not had the influence of that of Ancient Greece or Rome, but this does not mean that it has no legacy. Ghiberti, Mantegna, and Raphael are among the Renaissance artists who used Egyptian motifs; and it is an important, if minor, component in 19th- and 20th-century design.

In France, the revival was sparked by Napoleon's expedition to Egypt in 1798; and the sketches and artifacts brought back

by the 160 scientists and artists who accompanied his armies inspired French designers. Under the supervision of Vivant Denon, the Sèvres porcelain manufactory made a table piece that represented various Egyptian temples connected by an avenue of ram-headed sphinxes. An accompanying sugar bowl, its handle ending in a head adorned with a *kaffiyeh* (head-dress), was glazed with individually authentic hieroglyphs rearranged for design effect. In England, thanks to Nelson's victory over the French navy in 1798, the revival was as much patriotic as exotic. A dining room set in Egyptian style made for Lord Sandwich by Gillow was only one of several such commemorations.

In most cases, the Egyptian gloss on Empire and Regency designs was carried by easily recognizable motifs grafted onto conventional furniture forms. Thomas Sheraton showed the pharaonic head on a lady's work table, a canopy bed, and curtain tiebacks in the *Cabinet Encyclopedia* (1804), but broke from the mould in a chair with finials in the shape of dromedary heads. Thomas Hope took what he believed to be a more archaeological approach in *Household Furniture and Interior Decoration* (1807), in which he illustrated Egyptian-style furnishings he had designed for his house on Duchess Street around 1800. George Smith (1783–1869) showed an armchair based on the Egyptian prototype of front and rear animal legs in *Household Furniture* (1808).

Although it faded rapidly in France, increasing Anglo-Egyptian trade and tourism kept the style alive in England. Among the British visitors to Egypt was Owen Jones, author of *The Grammar of Ornament* (1856), who found in the conventionalised Egyptian motifs an antidote to excessive decoration. Several Arts and Crafts designers accepted this view, carrying the trend into the first quarter of the 20th century. Around 1857, William Holman Hunt executed a chair with a scooped seat and angled struts based on an Egyptian stool in the British Museum, even repeating the struts in the chairback where structure became decoration. In 1884, the Liberty Furnishing and Decorating Studio followed Hunt's lead, producing both three- and four-legged stools (known as Thebes stools) patterned on the museum's Egyptian holdings. That collection also attracted E. W. Godwin, whose work adapted rather than replicated the ancient furniture forms. The discovery of the tomb of Tutankhamun in 1922 by Lord Carnarvon and Howard Carter sparked both a series of exuberant motion picture palaces in Art Deco America, and Bertram Goodhue's relatively restrained Los Angeles public library. Within a few years, however, such fantasies were superseded by the intellectualized approach of the Bauhaus émigrés; and even the 1967 Paris exhibition of Tutankhamun's treasures failed to excite another revival.

Egyptian Revival

As one of the first exotic styles, along with the Gothic, to challenge the supremacy of Classical design, the Egyptian Revival reached its peak in interior design during the late 18th and early 19th centuries. While already existing in the later Roman Empire and re-emerging during the 1920s, partly inspired by the discovery of Tutankhamun's tomb, Egyptomania or *Egyptiennerie* achieved a particular popularity through the publications following Napoleon's campaign in Egypt in 1798. This event coincided with new tastes for monumental and richly ornamental forms associated with the literary and associational concerns of Romanticism. However, quite unlike its Greek and Roman equivalents, the Egyptian Revival never represented a coherent movement with ethical and social implications, and should be seen as one of those sporadic waves of European taste in design, often linked to archaeological enquiry. The study of Egyptian art and architecture, moreover, has continued to inspire a keen awareness of abstraction in design and of a decorative vocabulary of great sophistication right up to the present time.

Even before the Roman conquest of Egypt in 30 BC, the forms, rituals and architectural concepts of Egyptian civilization were being gradually absorbed into the classical world. Apart from the subsequent introduction of the mystery cults of Isis and Osiris, with their temple decoration, during the Empire, Hadrian may be regarded as one of the first Egyptian revivalists with the creation of the Canopus area of his villa at Tivoli, dating from around 130 AD. While certain motifs, such as obelisks and sphinxes recur frequently in funerary design during the Middle Ages, the Arab conquest of Egypt in 641 made access by Europeans difficult for many centuries. Apart from Bernardino Pintoricchio's esoteric fresco scheme featuring the bull Apis in the Borgia Apartments (1492–95), derived from Roman sources as well as Egyptian material in the growing Vatican collections, travel books on Egypt from the 16th century onwards began to provide fresh inspiration for artists and designers. Predictably, the more methodical archaeological activities of the 18th-century Enlightenment introduced a new seriousness in levels of information and interpretation, outstandingly represented by Frederick Norden's

Voyage de l' Egypte et de Nubie (1755) and the *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines et gauloises* (1752–67) of the highly erudite Comte de Caylus who first analysed the aesthetic features of Egyptian art as representing one of the cultural roots of European civilization with properties of grandeur, primitiveness, simplicity and massiveness.

The very first concerted attempt to create a fully integrated style of interior design according to Egyptian principles, supported by more radical theories of abstraction than those of de Caylus, was to occur within this intellectual context. During the early 1760s, the Venetian designer G.B. Piranesi produced a highly original painted interior in the Egyptian taste for the Caffè degli Inglesi in the Piazza di Spagna, Rome. In this work, long since vanished but recorded in two etched plates along with 11 fanciful chimneypiece designs in the same mode published in his testament of design, *Diverse maniere d'adornare i cammini ...* (1769), Piranesi used a variety of motifs derived from the Vatican collections and past publications. His justification for this style in the prefatory essay of the *Diverse maniere*, moreover, represented an exceptional understanding of Egyptian processes of abstraction from natural forms. While Piranesi's interior excited little enthusiasm at the time – the artist Thomas Jones described it in 1766 as “fitter to adorn the inside of an Egyptian sepulchre, than a room of social conversation” (quoted in B. Ford, editor, “The memoirs of Thomas Jones”, *Walpole Society*, XXI, p.54) – within the next two decades tentative signs of a sophisticated stylistic revival are seen for the first time, mainly in the decorative and applied arts. Apart from A.R. Mengs's *Camera dei Papiri* in the Vatican (c.1770), Piranesi's etched Egyptian compositions in the *Diverse maniere* were used as an ornamental quarry for designers as diverse as François-Joseph Bélanger, Pierre Gouthière and Josiah Wedgwood.

By the 1790s Neo-Classical taste for a more severe and monumental expression can be seen in the Billiard Room of Cairness House, Grampian, Scotland (1793) by James Playfair with its stepped chimneypiece and battered doorcases. Also after visiting Rome in the mid-1780s, as well as Egypt itself in 1796, the British designer Thomas Hope was to produce the most accomplished interior of the entire revival with his *Egyptian or Black Room*, devised between 1779 and 1801 for his London house in Duchess Street (demolished 1850) and illustrated in a plate published in his *Household Furniture and Interior Decoration* of 1807. Apart from his ingenious furniture, some pieces of which survive in the Faringdon Collection at Buscot Park, Oxfordshire, Hope employed a particularly vigorous colour scheme involving “that pale yellow and that blueish green which hold so conspicuous a rank among the Egyptian pigments; here and there relieved by masses of black and gold” (*Household Furniture*, 1807).

By the time that Hope had published this exceptional interior, he was able to pay tribute to new and unparalleled sources of archaeological information; namely the lavish books based on the expedition made by a commission of scholars, scientists and surveyors on Napoleon's 1798 Nile campaign in *Description de l'Egypte* (20 vols., 1809–28) and Baron Vivant Denon's equally lavish *Voyage dans la basse et la haute Egypte* (1802). These works were to impel the revival as far as the third decade of the new century, as reflected initially in the

Egyptian Revival: Thomas Hope's Egyptian Room, Duchess Street, c. 1800 (from *Household Furniture and Interior Decoration*, 1807)

applied arts ranging from the suite of furniture made by F-H-G. Jacob-Desmalter to designs by Charles Percier for Denon himself in 1809 (published in Percier and Fontaine's *Recueil de décorations intérieures*, Paris, 1801) to the ambitious *Service Egyptienne* in Sèvres of 1810–12, ordered by Napoleon (Apsley House, London). The closeness of these forms to the newly published finds is often in marked contrast to the imaginative licence shown by Piranesi, and even Hope. Moreover, the emerging Egyptian Revival taste proved to be as international a style as the Pompeian and Greek counterparts, represented in furniture designed by the Siennese Agostino Fantastici, and the British Charles Heathcote Tatham.

By the second decade of the 19th century, architects had begun to follow suit with designs for civic, commercial and engineering structures, but the Egyptian style had the most extensive application of all to funerary and cemetery buildings. Meanwhile interior designs in the taste were extensively applied to Masonic temples throughout the century on both sides of the Atlantic, a particularly late example being the Chapter Room in the Royal Arch Chapter of the Scottish

Freemasons in Edinburgh, produced in 1900 by P.L.B. Henderson.

Earlier in the century the High Victorian phase of the revival found a place in the campaign for improved art education, exemplified by the Egyptian Court by Owen Jones and Joseph Bonomi in the Crystal Palace, rebuilt at Sydenham after the London Great Exhibition of 1851 (destroyed 1936). Egyptian motifs also fulfilled a major role in Owen Jones's magnificent *Grammar of Ornament* (1856) which repeated Piranesi's respect for the Egyptian genius in natural abstraction. Later on, Christopher Dresser was to draw attention to functional properties he discerned in Egyptian utensils and furniture in his *Principles of Decorative Design* (1873), as well as producing several chairs based on ancient prototypes.

During the 20th century the influence of basic Egyptian forms and patterns has continued to recur, transcending the more ephemeral impact on jewellery and costume of Howard Carter's sensational discovery of Tutankhamun's tomb at Thebes in 1922. Certain formal influences have affected interior design, as reflected in such outstanding Art Deco works as the foyer of Oliver P. Bernard's Strand Palace Hotel, London,

of 1930 (destroyed 1967–68; parts now in the Victoria and Albert Museum, awaiting display), while the most persistent of all revivalist images, the pyramid form, has found its expression internally as well as externally in the work of the American architect I.M. Pei, notably in the controversial Louvre Extension of 1989.

Empire Style

"My favourite style is – I cannot deny it – a style which offers easy game to caricature", wrote Mario Praz, the historian and apologist of the early 19th century Empire style. "It is a common criticism that it is cold, stiff, that there is something funereally monotonous in its eternal sphinxes, its swans, its goats' and lions' feet ... A style for *parvenus*, with all that bronze gilt ornament on shining, heavy mahogany, that ostentation of richness in its crudest form, gold".

Napoleon I's domination of the European scene was relatively brief in historical terms, but his influence, directly or indirectly, on taste was quite extraordinary. The Empire style was conceived and developed over a short period, and yet it became a fashion not only in France, but in Italy, Spain, the Netherlands, Russia and Sweden as well as in England. Like the associated Regency style, it has been revived more than once and retains its popularity up to the present day. It has continued to offer inspiration to furniture designers and decorators, and yet in origin it was a style consciously developed by Napoleon and his artistic advisers to symbolise his dreams of imperial grandeur and the planned mastery of Europe.

The ground had already been prepared before the Revolution. The dramatic paintings by Jacques-Louis David had extolled the heroes of the Classical past – Socrates, Brutus, Hector and the widely admired group of the Horatii (which was to serve as a model for a clock) – and David himself was a leading figure in the circles influenced by the pre-Revolution fashion for the Antique which was only to intensify over the next two decades.

After 1795 France was ruled for a time by a Directoire consisting of three Directors; but in 1799, following the return of the then General Bonaparte from his Egyptian campaign, there was a change in the constitution when three Consuls, of whom Bonaparte was nominated the First, were appointed at the head of the government. Four years later he became Emperor. Hence the nine years of the Directoire and the Consulate were a transitional period politically and artistically between the *ancien régime* and the Empire. Stylistically, there was not a marked change at first from the late Louis XVI fashions. Architects such as François-Joseph Bélanger, Louis-Martin Berthault and Alexandre-Théodore Brongniart had been trained in the old school, and they still had contributions to make despite the rapid rise of Charles Percier and Pierre-François-Leonard Fontaine. The Jacob firm that had been patronised by Louis XVI and Marie-Antoinette was still the leading furniture-maker, and all these were associated with significant decorative commissions during the years of the Directoire and the Consulate.

David's *The Loves of Paris and Helen*, which was commissioned in 1788 by the Comte d'Artois (later Charles X), may be seen as a model for the many designs for bedrooms which began in 1798 with that of Mme. Récamier which became the talk of Paris. This famous room contains a classical statue on a pedestal, a tripod table or candlestand derived from Antiquity, a scroll-ended couch, all set against a draped background and, conceived by Louis-Martin Berthault and Fontaine, this Directoire design set a fashion for such theatrical compositions. The Récamier bedroom may be seen in a partial arrangement in the Louvre, but Robert Smirke's delicate

Empire Style: Salon de Musique, Malmaison, 1812; watercolour by Auguste Garneray

watercolour in the Royal Institute of British Architects Drawings Collection, London, captures well the combination of the Antique and feminine elegance.

On the other hand, the first Parisian townhouse of Bonaparte and his wife Josephine in the rue Chantierine introduced the military or masculine character that was to be incorporated in fashionable decoration. The beds had cannons as corner-posts and hangings simulating a tricolour tent, while the stools were modelled on military drums. Other furniture made for the Bonapartes at this time included the writing desk designed by Percier and now in the Grand Trianon, Versailles, which was lavishly ornamented with ormolu mounts and bronze figures in a manner that was to become typical of Empire furniture; but this too, although more overtly deriving from Antique sources in the detailing, was a development from late Louis XVI furniture. The tents and draperies in these rooms and in those at Malmaison, the most important pre-Empire commission, remained a characteristic of Empire decoration, largely because they were capable of creating a rich effect that could be assembled in a short time. Wallpaper simulating draperies became fashionable for the same reason.

Similarly, the fine furniture made by Georges Jacob and his two sons, Georges II and François-Honoré-Georges Jacob-Desmalter, was calculated to give an impression of luxury and richness with the highly polished mahogany and the applied ormolu mounts. Napoleon's blockade against the import of

products from England and her colonies meant that the supply of mahogany was reduced, and so it was used sparingly and as a veneer over an oak or walnut frame. Improvements in the design of the circular saw meant that thinner layers could be cut and so smooth surfaces and sharp angles became characteristic of Empire furniture. At the same time the veneered surface was highly polished to enhance the grain.

Apart from Percier and Fontaine, who wrote in their *Recueil* that "It is a delusion to believe that there are shapes preferable to those which the Ancients have handed down to us", the most influential figure in matters of art and taste during the Empire was Dominique Vivant, Baron Denon. His official position was director of the Musée Napoleon and of the Monnaie des Médailles; but he played an important part in major decorative schemes such as Percier and Fontaine's new apartments on the south front of the Tuileries. He was also largely responsible for adding to the decorative vocabulary; it was the publication in 1802 of engravings made from his drawings of Egyptian buildings and decoration, obtained during Napoleon's campaign in 1798–99, that provided the sources for the sphinxes and other Egyptian motifs that became popular. Percier and Fontaine included a clock and a secretaire-bookcase in the *forme égyptienne* with Osiris-headed terms in their *Recueil*; other products of this fashion are the portico with palm columns added on the Emperor's instructions to the Hôtel de Beauharnais, Paris in 1806, the

Sala Impero in Palazzo Massimo, Rome, and the Sèvres Egyptian Service made in 1810–12 and now in Apsley House, London.

It was after the Egyptian campaign that Bonaparte returned to Paris and was made First Consul. Fontaine was instructed quickly to restore the Tuileries as a residence, at first using silk hangings and porcelain that had belonged to Marie-Antoinette. During this period Percier and Fontaine were also commissioned to remodel and decorate Malmaison but after Napoleon seized the throne and proclaimed himself Emperor in 1804 there was a new initiative to restore the splendour of the French court. Even when there was an opportunity to buy back furnishings taken from the royal palaces during the Revolution it was made clear that “His Majesty wants to create the new, not to order the old”. Factories were re-opened, craftsmen were given loans to start up in business again, and a greater richness of colour and elaboration of ornament succeeded the generally elegant Neo-Classicism of the Directoire and the Consulate.

By 1813 Napoleon had decorated and furnished all his residences with furniture made by the Jacob family, Gobelins tapestries, Savonnerie carpets, Sèvres porcelain and Thomire bronzes. The throne room at Fontainebleau gives a good idea of the effect he wanted, with much symbolism of large N's, imperial eagles and Bonaparte bees; while the Emperor's and Empress's apartments at Fontainebleau and Compiègne are among the best surviving examples of what was provided for him at the height of his glory by Percier and Fontaine and their associates. The Emperor's bedroom at Fontainebleau is largely gold with gilded Jacob furniture, while that of the Empress has a patterned silk as wall hangings. At Compiègne the rich and sombre library was also furnished by the Jacobs, while the Empress's dining room is a relatively modest room with marbleised walls and plainer Jacob furniture. Two other Parisian residences could match the royal palaces, the Hôtel de Beauharnais (now the German Embassy) where Napoleon's stepson Eugène de Beauharnais and his sister, Queen Hortense, lived, and the Hôtel de Charost (since 1814 the British Embassy) where Pauline (Bonaparte) Borghese entertained. Both still retain their decoration and furnishings.

Napoleon's second marriage, to Princess Marie-Louise in 1810, was a signal for more redecoration and refurnishing, this time in an even more luxurious and richly imperial style. The Emperor's bedroom at Compiègne was hung with crimson silk, and the bed was crowned by a great gilded eagle and flanked by gilded corner posts supporting busts of Minerva. The rest of the furniture was heavily gilded and covered with the same crimson silk, while the new Empress was given a bed made of gilded cornucopia, with large gilded angels holding up the drapes which hang from a gilded crown topped with white feathers. Not to be outdone, the ex-Empress refurnished some of the rooms at Malmaison, including her bedroom which became an oval tent, with scarlet draperies embroidered in gold, upheld by small columns of gilded wood. The gilded bed had swans at the head and cornucopia filled with fruit at the foot, behind which white and gold draperies hung from a gold crown on top of which a golden eagle had settled on a spray of gilded roses.

Napoleon's occupation of Italy prompted more redecoration and refurnishing in the palaces that were to receive him.

In Rome, the Quirinale from which the Pope had been evicted underwent changes orchestrated by Carlo Finelli to conform to the imperial taste around 1811. In Venice the Ala Napoleonica e Nuovissima was constructed by Giuseppe Maria Soli and Lorenzo Santi from 1810 to 1813 in Piazza San Marco, with decorations by Giuseppe Borsato and Giovanni Carlo Bevilacqua; and on the Venetian mainland some parts of the large Villa Pisani, Strà were redecorated by Gianantonio Antolini after Napoleon had bought the building in 1807 as a residence for Eugène de Beauharnais, Viceroy of Italy.

The Emperor had every intention to found a dynasty and to guarantee the future of his Empire, so whenever possible he exalted members of his family, first giving them Royal titles then arranging advantageous marriages, and finally putting them on thrones from which he had temporarily succeeded in toppling the legitimate monarchs. Thus there were Napoleonic courts in Italy, Germany, Holland and Spain, each with its several palaces which had to be refurnished. Consequently, there is a curious similarity in royal palaces in all these countries even today. Joseph Bonaparte became king of Spain, and Napoleon commissioned Percier and Fontaine to design an elaborately detailed small room which was fabricated in Paris and then transported to Aranjuez, including mirrors and painted panels. Louis Bonaparte was made king of Holland and he took over Amsterdam Town Hall as his palace, making Jean Thibault responsible for the alterations and for decorating and furnishing in the Empire style. The work itself was executed by four Dutch craftsmen. After Napoleon's downfall the building continued to be the royal palace and the collection of Empire furniture is the finest outside France.

Elisa Bonaparte married the Prince of Lucca and became Grand Duchess of Tuscany, acquiring five palaces including Villa Reale, Marlia, where a Salotto Impero was created, and Palazzo Pitti, Florence which was completely redecorated in 1810–13 with wall-hangings, bronzes, tapestries and carpets from Paris. Again, the furniture was made by local craftsmen, thus contributing to the prevalence and continuity of the Empire style in Italy. Joachim Murat, the husband of Caroline Bonaparte, became king of Naples and he lavishly redecorated the palaces at Caserta and Portici; the Bourbons were overwhelmed when they returned and saw the result. Sweden was not a part of the Empire, but the style was taken there when General Bernadotte, one of Napoleon's Marshals, was elected Crown Prince, and subsequently became king in 1818. Rosendal, close to Stockholm, is the finest example of the Empire style in Scandinavia but Swedish craftsmen and the painter Pehr Emanuel Lundelius were in charge; only the carpets and clocks were imported from France, the furniture and silks being produced in Sweden. The Russian court quickly adopted many of the style's characteristics, to which it could add the lavish use of malachite from Siberian quarries. And in England, in 1822 Rudolph Ackermann commented on one of the designs in his *Repository* that the “taste for French furniture is carried to such an extent, that most elegantly furnished mansions, particularly the sleeping-rooms, are fitted up in the French style”.

George IV admired the Empire style, and one piece of furniture in which he took especial pride was a gift from the newly restored French king, Louis XVIII. Known as the *Table des Grands Capitains*, it was commissioned by Napoleon in 1806

from the Sèvres manufactory. Made of hard-paste porcelain with gilt bronze mounts, the stem is in the form of a bundle of pikes, while the porcelain top represents Alexander the Great surrounded by scenes of his victories and an outer circle of profiles of twelve other commanders from Antiquity; but it was not completed until 1812 and Napoleon had little pleasure from what was intended to be another act of self-glorification identifying himself with the military heroes of the past. As a symbolic gesture, George IV chose to be portrayed by Sir Thomas Lawrence in his Coronation robes with his hand resting lightly on this table as if to underline, with an item of furniture, the Emperor's downfall.

There were several Empire revivals in the late 19th and early 20th centuries and the style has retained its popularity up to the present day. During the 1920s and 1930s, the taste was greatly stimulated in France by the connoisseur Paul Marmottan whose outstanding collection of Empire furnishings is now on public display in the Musée Marmottan, Paris. The English Vogue Regency flourished during the same period and was similarly encouraged by collectors such as Edward Knoblock who had purchased many items of furniture at the sale of Thomas Hope's country home, Deepdene. More recently, tent-rooms and swagged draperies were revived during the late 1980s by fashionable decorators.

Selected Collections

The Musée Marmottan, Paris, specialises in work of the Directoire and Empire periods and contains many designs and examples of furnishings and decorations. Notable examples of Empire Style furnishings and interiors survive in France in the Château de Malmaison, the Hôtel de Beauharnais, Paris, the Château de Compiègne, and the Château de Fontainebleau; in Germany in the Schloss Wilhelmshölme, Kassel, and the Schloss Charlottenhof, Potsdam; in Italy in the Pitti Palace, Florence, and the Royal Palace, Caserta, Naples; in Russia in Mon Plaisir, Peterhof, St. Petersburg; and in Sweden in Rosendal, near Stockholm.

Erdmannsdorff, Friedrich Wilhelm von

1736-1800

German architect

Friedrich Wilhelm von Erdmannsdorff is one of the most important German architects of the mid- and late 18th century, during the transition from the late Baroque to the Neo-Classical styles (at first Roman and later Greek). His patron, Prince Leopold Friedrich Franz of Anhalt-Dessau (1740-1817) sent him to Italy in 1761, and they travelled together to England in 1763 and Italy in 1765-66. The neo-Palladian houses and new English informal gardens which they saw were to play major roles in Erdmannsdorff's works for the prince and others. Equally, if not more important were the Italian journeys, where he became a pupil of the French architect-artist-archaeologist Charles-Louis Clérisseau (1721-1820) in the study of ancient monuments and decoration which would be the basis for his later architectural works in Saxony. He also met in Rome J.J. Winckelmann, the leading writer on classical art, and the printmaker Giovanni Battista Piranesi, and in Naples Sir William Hamilton, the great collector of ancient art.

On his return to Germany Erdmannsdorff first designed new interiors, particularly the Festsaal of the Prince's town palace at Dessau; this was in a classical style, with great Corinthian columns, inset classical-style reliefs and friezes above the doors and a rinceau cornice. A circular study was decorated in stucco with painted medallions. All of these resembled Clérisseau's designs, as well as the work of Robert Adam which Erdmannsdorff had probably seen in England. However, Erdmannsdorff's decoration was less delicate and refined. The architect's major work for the prince was the palace and gardens, including pavilions, at Wörlitz (1769-98). The exterior in the English Palladian style was probably influenced by Henry Holland's Claremont of 1769, but the result was slightly heavier. The plan was also Palladian in its clarity of parts, but the decoration of the rooms with their raised

stucco decoration derived from the antique, and the inset painted scenes were in the new classical style of Clérissseau and Adam, but again less delicate. The fireplaces were based on the designs of Piranesi. Certain details were derived from Robert Wood's study of the Roman remains at Palmyra. The influence of the wall paintings of Pompeii is evident, particularly in the frescoes in the library, with their inset scenes and portraits of ancient and modern figures in the antique style. The Grand Saal shows the influence of Pompeii in its stucco and painted decoration combined with details from the Carracci's 17th-century Farnese Galleria and the Roman acanthus frieze from the Villa Medici. Although a major example of the Neo-Classical style in Germany, the room's overly rich decoration and multiplication of details make for a certain heaviness, and it lacks the refinement of the work of Adam. Furniture for the palace in the classical style was designed by David Roentgen. While most of the palace was decorated with classically-inspired works there was also a Chinese room.

This profusion of styles is even more evident in the pavilions scattered throughout the gardens, the first landscape garden in Germany. Most of these are classical and are freely based on such buildings as the Pantheon and the Temple of Tivoli; some are more severe and Palladian in character. One was even in the Gothic style. Many of these pavilions have elaborate interiors, such as the elegant dome of the Pantheon. The most interesting is the Villa Hamilton, also known as the Villa Stein (1791–94), with its Pompeian decoration, stucco work and ceiling paintings. The decoration was inspired by engravings of the recently excavated buildings at Herculaneum. The interior included ruin paintings by Clérissseau, classical reliefs designed by John Flaxman for Wedgwood, copies of Raphael frescoes, and Greek *klismos* chairs which are among the earliest examples in this style.

Erdmannsdorff's later work in Berlin at the Royal Palace (1787–89) is flatter and less brittle, relying more on painting and less on raised stucco decoration. The classical scenes are larger in size as are the panels of decoration, and there is more of a feeling of Raphael than the antique. This is particularly apparent in the Speisesaal. In some rooms the ceilings resemble those at Wörlitz in their profusion of small and fussy classical details inspired by Roman stuccos and wall paintings, but in others, such as the one in the Königskammern, there are vast areas of empty space contrasting with the large classical scenes and *grotteschi* decoration. It is only in such rooms as the Goldener Kammer in the Schloss Monbijou, Berlin (1788–89) that one returns to the large rectangular or arabesque and *grotteschi* panels of decoration without the intrusion of classical scenes. The feeling here is reminiscent of the work of Erdmannsdorff's teacher Clérissseau in his design for the Hôtel Grimod de la Reynière and the Roman House for Catherine the Great.

Erdmannsdorff introduced the latest artistic and architectural thinking into Germany in his buildings, gardens and, most importantly, in his classically-inspired interiors, which were based on ancient sources often combined with the Renaissance and Baroque classical motifs. These interiors also often included furniture specifically designed for the rooms, which added to his vision of classical antiquity.

THOMAS J. MCCORMICK

Biography

Born in Dresden, 18 May 1736. Studied mathematics, history, philology, natural sciences and philosophy at the University of Wittenberg, 1754–57; made study trips to England and Holland in 1763; visited Italy, where he met Charles-Louis Clérissseau, G. B. Piranesi, J. J. Winckelmann and William Hamilton, in 1761–63, 1765–66, 1770–71. Met Prince Leopold Friedrich Franz of Anhalt-Dessau in 1756; acted as his artistic adviser, agent and architect from 1757. Active as an architect and designer of interiors from late 1760s; designed some furniture from c.1766. Summoned to Berlin in 1787 and worked in the service of Friedrich Wilhelm II of Prussia. Further travel throughout Germany and Italy, 1787–80. First artistic director of the Dessau institute of copper engraving, 1796–1800. Died in Dessau, 9 March 1800.

Errard, Charles c.1606–1689

French painter, engraver and architect

Charles Errard was one of the most important artists of his time and precisely why his name is so little known outside France today remains a mystery. Errard was a close friend of the painter Nicolas Poussin, and his work represents a contin-

uation of Poussin's classical tradition; he dominated artistic production in Paris in the mid-17th century. He was involved in all the major royal palaces ranging from the Fontainebleau to Versailles, he occupied senior positions at Court and at the French Academy in Rome, and he exercised a decisive influence on French decoration in the period leading up to the supremacy of Charles Le Brun.

Born in Nantes in about 1606, Errard made frequent, extended trips to Italy throughout his long career. He spent a total of almost thirty years in Rome where he was able to immerse himself in the study of antique monuments and ornament which he greatly admired. His first visit took place between 1627 and 1637 when he trained as a painter in the workshop of Poussin. He returned again in the early 1640s and in 1666 he was appointed head of the Académie de France in Rome where he remained until 1683. Errard's major works, however, were executed in France. In 1640 he was active in Paris, providing historical scenes for tapestries, and in 1643 he was appointed Peintre Ordinaire du Roi and granted a pension and lodgings in the Louvre. Several important commissions ensued and he was entrusted by Cardinal Mazarin with the decoration of the Palais Royal, the residence of the young Louis XIV. His interiors for the theatre were greatly admired as were his stage sets for performances by the Italian opera which he executed with the help of his assistants Sève and Noël Coypel. In 1648 Errard decorated a private house in the Quai Notre Dame with scenes from Ovid's *Metamorphoses*, and during the mid-1650s he was involved in the decoration of the private apartments of the King, Cardinal Mazarin and the Queen's mother in the Louvre. The ceiling of the dowager Queen's apartments were praised in Saville's *Antiquités de la Ville de Paris* as being the last example of gallantry and magnificence in court decoration. Unfortunately, however, only fragments of Errard's work have survived, namely the pilasters decorated with arabesques which are now in the Palais Luxembourg.

As official Peintre du Roi, Errard was put in charge of all the decorative work at the Tuileries and Fontainebleau as well as the Louvre, and he subsequently directed work at Versailles (1661). His closest assistants were the sculptor Marsy and Noël Coypel, and in 1656 Errard and Coypel painted the ceiling of the Grand Chambre in the Parlement de Rennes. This was one of Errard's most impressive endeavours. Unlike the Baroque decorations that he had seen in Rome which included vast illusionistic expanses of sky, Errard's ceiling was divided into compartments containing painted figures within medallions surrounded by gilt wood frames. The allegorical figures are delineated in profile using strict rules of perspective. This style must have appeared quite old-fashioned by this date, but alternatively it can be viewed as a move towards a purer form of classicism. Other areas of the ceiling are filled with grotesque ornament painted on a gilded surface. This type of decoration had become increasingly popular in Northern Europe following the widespread publicity accorded the discovery of ancient examples in Nero's Domus Aurea and the work of painters such as Raphael and Giovanni da Udine in the Vatican Loggia and other palaces in Rome. But once again Errard did not slavishly follow antique precedents but used grotesque ornament in a freer and more purely entertaining manner. The Rennes commission was followed in 1657 by

work in the theatre of the Tuileries, and later by projects at Versailles, S. Germain-en-Laye and Fontainebleau. Errard also decorated various private houses during this period, notably those belonging to the financiers Le Charron, La Bazinière, and Catalan.

In addition to his work as a painter, Errard also devoted much of his time to publishing books and suites of ornament. Together with Fréart de Chambray, he translated Palladio's four books of architecture during the 1640s, and in 1650 he illustrated Chambray's *Parallèle de l'Architecture antique et de la moderne*. He also translated Leonardo's *Trattato della pittura* which he illustrated with engraved paintings after Poussin; published in 1651, this was the first printed version of Leonardo's treatise. Also in 1651 he published three suites of Baroque ornament dedicated to the Queen Christina of Sweden: *Divers Ornaments* (eight plates), *Divers Trophées* (six plates after Polidoro da Caravaggio), and *Divers Vases antiques* (twelve plates). Some time after 1655 he published six plates showing the interiors of the Louvre entitled *Ornements des appartements de la Reine au Vieux Louvre*, and during his time as head of the French Academy in Rome he designed the ornaments for Bellori's *Vite* (1672).

The period between 1653 and 1661 was the most successful and busy time of Errard's career, but from the early 1660s his reputation was increasingly eclipsed by that of the rising star, Charles Le Brun. Errard continued to receive commissions for work at S. Germain and Fontainebleau but the most important projects were awarded to Le Brun. And when Le Brun was made a member of the Conseil des Bâtiments, a position that would have given him a decisive say in much of Errard's work, Errard left Paris to take up his official appointment in Rome.

Given the paucity of Errard's surviving work, it is hard to arrive at an accurate evaluation of his talents as a decorative painter and designer, and he is generally remembered today only for his use of grotesque ornament. Within a broader context, however, with his cosmopolitan and scholarly background, Errard must have had an indirect but nevertheless important influence on the French Academic style attributed to and embodied by Le Brun.

PIA MARIA MONTONEN

Biography

Born in Nantes c.1606. Trained as a painter in Rome from 1627. Returned to Nantes, before travelling to Paris, 1637. After a second Roman trip, appointed Peintre Ordinaire du Roi in Paris, with pension and lodgings at the Louvre, 1643; appointed Peintre du Roi, 1644. Founder-member of the Académie Royale, 1648: treasurer, 1651; rector, 1655; director 1657. Directed and designed decorations and operas at royal palaces in Paris and at Saint-Germain-en-Laye, Fontainebleau and Versailles, 1661, and produced designs for tapestry and theatre. Translated Palladio's *Four Books of Architecture*, 1650, and Leonardo da Vinci's *Trattato della pittura*, 1651; published several books of ornament, 1647–51. Church architect in Paris, c.1663. Married 1) Marie de la Rue (died 1661); 2) daughter of Claude Goy, 1675. Appointed head of the French Academy in Rome, 1666. Member of the Academy of St. Luke, Rome. Returned to France, 1683. Died in 1689.

Selected Works

1643 Palais Royal (theatre): Cardinal Mazarin

- 1644 Hôtel de Senneterre (Grande Galerie paintings)
- 1648 Hôtel Charron, Paris (Cabinet; scenes from Ovid's *Metamorphoses*): Jean Charron
- 1654–55 Louvre, Paris (painted and arabesque decoration in apartments of the King, Cardinal Mazarin, and Queen Mother): Louis XIV
- 1656 Parliament (now Palais de Justice), Rennes (ceiling decoration, with Noël Coypel)
- 1657 Tuileries, Paris (salle de théâtre, with Noël Coypel)
- 1658 Hôtel de la Bazinière, Paris (paintings, together with Le Brun, Le Sueur, Boulogne): Bertrand de la Bazinière
- 1658 Hôtel Séguier (chambre l'alcove): Chancellor Pierre Séguier
- 1662–63 Palais Royal, Paris (chambre l'alcove): Duc d'Orléans
- 1662–65 Petit Château, Versailles (arabesques): Louis XIV

Etruscan Style

The conscious search for a contemporary style of expression under Neo-Classicism during the late 18th century in Britain is supremely demonstrated by the creation of the Etruscan Style in interior design. While ostensibly derived from the shapes, motifs and colours of antique vases (initially misunderstood as Etruscan and later recognised as largely Greek), it also drew inspiration from Renaissance grotesque ornament and material discovered at Herculaneum and Pompeii.

An interest in Etruscan culture and art, while it can be traced back to the theorists of the Italian Renaissance, was first seriously developed by the Scottish 17th-century historian Sir Thomas Dempster whose pioneering researches were posthumously published in 1723–25. By this time a growing patriotic movement in 18th-century Italy led to the foundation of the Accademia Etrusca at Cortona in 1726 and the Museo Guarnacci at Volterra in 1750. By the 1760s, excavations and the accumulated publications of scholars such as Gori, Passeri, Guarnacci and the Comte de Caylus, assumed a new significance for early Neo-Classical designers searching for fresh sources of inspiration. The architect and engraver G.B. Piranesi, partly inspired by his friend Thomas Jenkins's excavation in tombs at Corneto (modern Tarquinia), portrayed the Etruscans as Rome's chief source of inspiration in his polemical work *Della magnificenza ed architettura de' Romani* (1761) when countering the arguments of the Greek Revivalists, led by the eminent German scholar J.J. Winckelmann.

"Etruscheria" swiftly became "Etruscomania", and owing to the confusion of evidence, extravagant claims were made concerning the respective influences of Greeks and Etruscans on Roman culture. The Scottish antiquary James Byers was preparing a history of the Etruscans (posthumously published in 1842) during the 1760s when his engraved plates were in circulation, while Piranesi, in 1765, issued three etchings of wall decorations from tombs at Corneto and Chiusi. Both authors were in regular correspondence, meanwhile, with the distinguished connoisseur Sir William Hamilton in Naples who was assembling his first major collection of antiques, chiefly found in Southern Italy. This material was published between 1766 and 1776 in the lavish four-volume *Collection of Etruscan, Greek and Roman Antiques*, under the authorship of the scholar Baron d'Hancarville, with the express aim of providing inspiration for contemporary designers.

The potter Josiah Wedgwood was already familiar with proof plates of Hamilton's publication by the 1760s and applied the term "Etruscan" to certain basalt vases made to imitate that civilization's bronze vessels. This particular ceramic material was also the basis for other wares decorated with encaustic and enamel paintings, closely based on Hamilton's plates and described as being in the "Etruscan style". From 1769, when Wedgwood and his partner Thomas Bentley opened "Etruria", their factory at Burslem, Staffordshire, they also introduced antique plaques and large cameos, advertised as in "black basaltes with Etruscan burnt-in grounds". In 1773 their *Catalogue of Cameos, Intaglios, Medals, and Bas Reliefs, with a General Account of Vases and Other Ornaments after the Antique* included "Etruscan" ornaments as "fit either for inlaying, as medallions, in the panels

Etruscan Room, Osterley Park, Middlesex, 1775-76

[sic] of rooms, as tablets for chimneypieces, or for hanging up as ornaments in libraries ... or as pictures for dressing rooms".

Wedgwood's intentions were to be swiftly adopted and by 1771 James Wyatt had produced what is now generally accepted as the first Etruscan Style interior, within a modest fishing pavilion on the Thames at Fawley Court, Buckinghamshire. This room, probably carried out by Biagio Rebecca – one of the decorative artists most associated with the style – has pale green walls which are given the appearance of being hung or inlaid with antique figures, medallions and plaques after Wedgwood. In 1773 the Adam brothers, with their customary entrepreneurial skill, swiftly applied the style in a dressing room for the Countess of Derby in Grosvenor Square, London. Their engraved designs (frequently issued in colour) for the ceiling and chimneypiece appeared in Volume II of their *Works in Architecture* (1779), in which they flagrantly claimed to have invented the style. They did, at least, identify the style by name and defined its essential characteristics as involving the colour, i.e. terracotta and black, and style of the ornament "both evidently taken from the vases and urns of the Etruscans" (*Works*, 1779, Preface, p.2.).

For all their opportunism, the Adams' work, represented in at least eight Etruscan interiors, designed between 1773 and 1780, should be seen as a considered response to Piranesi's call for a modern style in interior design, based on a broadly eclectic use of Antiquity, in his highly influential folio *Diverse maniere* (1769). In this publication the Venetian designer had recognised the potential for transposing vase motifs for other decorative functions and at least two of his opening plates show this principle applied to wall compositions with chimneypieces, clearly influencing the Adams' Etruscan interiors. The finest and most complete of these to survive is the dressing room at Osterley Park, Middlesex, carried out for the banker Robert Child and his wife Sarah mainly around 1775–76. This integrated scheme, probably painted by Pietro Maria Bognis, in colours of terracotta and black on a blue-grey ground, involves not only the four walls, two doors and ceiling (with roundel by Antonio Zucchi) but also its carpet (no longer extant), eight chairs, a chimney-board, a pole-screen, and the curtain cornices of the two windows. While in 1778 Horace Walpole scathingly noted the Wedgwood influence, Mrs. Lybbe-Powys perceptively remarked in 1788 on the room's debts to Herculaneum.

In addition to those at Derby House and Osterley, other Etruscan rooms by the Adams included a partially-surviving one at 20 Portman Square; a small room under the garden-front staircase, also at Osterley; and others, no longer surviving, are recorded at Cumberland House (1780), "Mr Adamson's parlour" (possibly at the Adelphi), both in London, as well as at Harewood House and Byram House, both in Yorkshire. A number of imitations followed, the most distinguished being Thomas Leverton's entrance hall at Woodhall Park, Hertfordshire, of the 1770s.

By the 1780s painted interiors after the Antique in France had been absorbed into the Louis XVI style, as introduced by the Adams' colleague C.L. Clérissieu (he is also documented in 1764 as having produced an "Etruscan room" for Cardinal Albani in Rome, no sign of which survives). But a more specifically Etruscan manner appears in interiors by F.J. Bélanger and J.D. Dugourc (notably those at Bagatelle), as well as in

furniture by Georges Jacob, executed for Marie Antoinette's Laiterie at Rambouillet in 1787 and described as "de forme nouvelle de genre étrusque".

In England, meanwhile, the Etruscan Style underwent a new and particularly astringent interpretation by Wyatt in a small anteroom at Heveningham Hall, Suffolk, completed before 1784 for Sir Gerard Vanneck. The residual traces of illusionistic devices from Herculaneum and use of the "Grottesque", as seen at Osterley, are here replaced by a system of composition involving pale green walls with white wood and plaster enrichments as a particularly austere context for terracotta figurative panels, mainly derived from Hamilton's *Antiquities*. The integrated painted furniture includes a pair of highly idiosyncratic candelabra, based on urn forms, in opposing niches.

By 1791–95 Hamilton's second collection of vases was published, as delineated by the artist Wilhelm Tischbein. This work revealed an awareness of their Greek origins, although the original misconception persisted and C.H. Tatham, writing from Rome to Henry Holland in 1796, described these latest illustrations as being "in the Etruscan style, precisely copied from Sir William Hamilton's Vases and adapted to small rooms and cabinets ..." (C. Proudfoot and D. Watkin, "A Pioneer of English Neo-classicism" in *Country Life*, 20 April 1972, pp.918–21). However, by then the fresh revelations at Pompeii were already encouraging bolder and more colourful interior schemes while the change from "Etruscomania" to "Etruscology" in Italy was being impelled by the magisterial researches of Luigi Lanzi. Only thereafter did the Etruscan Style appear as one among many historicising modes of expression, such as in 1834 when Pelagio Palagi and Carlo Bellosio created an Etruscan room in the Castello Reale di Racognigi, near Turin, for King Charles-Albert of Piedmont, reflecting the heavy opulence of the late Empire style.

F

Federal Style

The Federal Style, which began around 1785, takes its name from the post-revolutionary period in which the United States established its federal government. Its architecture is a greatly simplified version of buildings by Robert Adam. Its furnishings are comparable in style and workmanship to contemporaneous English designers, thanks to the availability of their pattern books and the influx of craftsmen from the British Isles. The Federal Style was quickly overlaid, and then replaced, by the Greek and Roman prototypes of the Classical Revival. Because of this rapid evolution, authorities divide on the duration of the period. Some extend it to 1830, by which time the erosion of Neo-Classical antecedents was complete; but the character of the style is better captured if the line is drawn around 1810, when this influence was disappearing but discernible.

The War of Independence interrupted the natural evolution of American furnishings and architecture as the country turned its attention to survival, and craftsmen joined the army or produced its goods. The end of the war saw not only built-up demand, but the necessity to increase manufacturing and commerce to make the new nation self-supporting. A wave of immigration helped to swell the population, and a rising prosperity based on trade increased the audience for designed products.

Furniture makers reacted quickly. In an announcement of March 1790 illustrated with a Hepplewhite shield-back chair, London-trained George Shipley notified the readers of the *New York Daily Advertiser* that his workmen made furniture in “the neatest, and most fashionable manner,” and that mahogany planks and logs were for sale in his yard. Like Shipley, many craftsmen had become entrepreneurs, retailing lumber and hiring journeymen – Scottish immigrant Duncan Phyfe had some 100 workers at his shop in New York. Others began to specialize in the new techniques required by the changing style, producing veneers or inlaid designs. As a result, popular forms were standardized, the use of machines increased, and some artisans set up merchandising warehouses to sell their own work and that of others.

Competition for jobs was fierce at all levels. In Philadelphia, which had over 120 cabinet- and chair-makers in the 1790s, tensions between journeymen and masters led first to a labor strike and then to the publication of *The Journeymen Cabinet and Chair-Makers Philadelphia Book of Prices* (1795). In

1796, the journeymen won their demand for a six-day week and a median wage of a dollar for an eleven-hour day. Their price book reveals the average number of days required to produce various furnishings (and thus the complexity of their construction), and the mark-up imposed by the masters when work was sold. Among the longest to produce, was a “circular bureau” (nine and a half days), among the shortest a “splatt back chair” (just under two days). Mark-ups ranged from 25 per cent for a square card table to 50 per cent for a dining table, 4 x 5 (\$8.08 for labor, \$16.05 retail), and averaged around 30 per cent.

Although the United States was no longer a colony, English prototypes continued to dominate its furniture design, reinforced by pattern books, imported furnishings, and immigrant artisans. The basic texts of the trade were Thomas Shearer’s *The Cabinet-Makers’ London Book of Prices* and George Hepplewhite’s *The Cabinet-Maker and Upholsterer’s Guide*, both published in 1788, and Thomas Sheraton’s *The Cabinet-Maker and Upholsterer’s Drawing Book* (1791–93). Like the pieces illustrated in these works, American furniture was finely proportioned and small in scale, with straight and tapering legs. Its surfaces were veneered, inlaid, and occasionally embellished with low-relief carving.

American craftsmen were more likely to interpret than to copy, however. If Salem carver Samuel McIntire modeled the set of oval back sidechairs made for Elias Hasket Derby in 1798 on Plate 8 of the 1794 edition of Hepplewhite’s *Guide*, he marked them as his own by carving his signature grapes and grape leaves on the front legs. Similarly, a sofa attributed to Jacob Sanderson of Salem, and perhaps carved by McIntire in 1802 or 1803, drew on Sheraton’s 1791 *Drawing Book* for its silhouette and on Plate 6 of Shearer’s *London Book of Prices* for the basket design that decorates its top rail. (Sidechair and sofa are held by the Winterthur Museum.) New York chair-makers produced a variety of square chairbacks patterned on Plate 36 (no. 1) of the *Drawing Book*. Additionally, Americans regularly supplemented the Neo-Classical motifs they shared with England – swags, urns, paterae husks, palmettes, classical figures – with the eagles and shields that celebrated the national identity.

Although Federal pieces integrate Hepplewhite and Sheraton designs, many authorities have developed criteria to distinguish the two sub-styles, even as they admit that “Hepplewhite-Sheraton” is a realistic nomenclature. American

Federal Style: McIntire Room in the Winterthur Museum, Delaware

Hepplewhite chairs have oval, shield-, or heart-shaped backs, frequently incorporating a draped motif; Sheraton chairbacks are squared, the top rail broken by a straight, raised section. The legs of Hepplewhite pieces are generally square and tapered, often carved, fluted, or inlaid, and ending in spade feet; Sheraton-style legs are more frequently round-sectioned and reeded, with a thimble-shaped foot. Hepplewhite arm stumps rise in a concave curve from the front leg or side rail and, in upholstered pieces, form a nailer for the fabric cover; Sheraton arm stumps rise straight from the front leg and, in upholstered pieces, stand free of the upholstered edge. A sideboard with a serpentine front – and, thus, concave ends – is a Hepplewhite; straight or segmental fronts mark the piece as a Sheraton, as do convex ends. Architectonic looking-glasses flanked by twin colonnettes are identified with Sheraton, although he shows only one wall mirror (Plate 50, *Cabinet Dictionary*, 1803) which, while rectangular, is not in the columnar style. Finally, there is a greater use of pediments, smooth bracket feet, and contrasting woods in Sheraton case-pieces.

The regional variations that had marked colonial furniture continued after the war. These could include construction methods. In Salem, Massachusetts, chairs were often braced with triangular, horizontally grained blocks, while Philadelphia used quarter-round, vertically grained blocks. Regional variations could also include a preference for certain forms (such as the square chairback popular in New York); and there were individual artisanal signatures such as McIntire's grapes and the extremely fine inlay which English immigrant John Seymour and his son Thomas patterned to make the eye see movement. Baltimore craftsmen are perhaps the most idiosyncratic, known not only for their black-and-gilt finishes but for the *verre églomisé* panels (glass painted with gold and black on the reverse side, and usually representing allegorical figures) found almost nowhere else.

A few furniture types, such as the lowboy, disappeared from the lexicon, while specialized pieces were developed to make life more comfortable and convenient. Chief among these were the tent or canopy bed; the window seat; the rocking chair; the open-arm "lolling chair" (for unknown reasons, also called the

Martha Washington); basin stands; worktables to hold a lady's writing and sewing equipment; and canterbury stands to hold her music. Dining rooms, newly important to social life, saw the introduction of sideboards, knife boxes, cellarettes, and sectional dining tables assembled from a centre drop-leaf supplemented with half-round side tables and held together with brass clips. The importance of dining as social activity is corroborated by the number of arm- and sidechairs (in sets of up to 24) ordered from the various workshops.

The new style required more sophisticated woodworking techniques, and these were made possible by machine-cut nails and refinements in sawing technology. Bowed and serpentine doors and panels were built up from vertical strips laid over a caul carved from the solid; curved drawers were constructed rather like brick walls, being made of small sections of wood laid horizontally and glued together. Surfaces were almost always veneered, and often inlaid. Mahogany and satinwood were the materials of choice, although other contrasting woods could be used, their colors further differentiated with cross-banding and stringing. The line of leg and edge was often stressed with fluting or reeding, the change from the convex to the concave beginning around 1800; and the unity of form and surface was emphasized with wax or (after 1800) a French polish (shellac dissolved in spirit).

If Federal Style furnishings resembled English prototypes, Federal architecture did not. For economic and cultural reasons, the Neo-Classical movement sparked by Robert and James Adam in the 1760s had little impact in either colonial or federal America. What versions of the Adam style that did reach these shores tended to come from popularizing builders' manuals, such as William Pain's *Practical House Carpenter* of 1766 and *Practical Builder* of 1774. In any case, America favored the traditional styles of the early Georgian period in its dwellings and those of Continental Europe in its public structures. While a recognizably "Federal" architectural style developed by the late 1780s, it rather quickly yielded to the Classical Revival that emphasized form over applied detailing.

The typical Federal façade was clapboarded and symmetrical, its centrally located entrance a composition of six-paneled door, framing pilasters, and elliptical fan light, sometimes sheltered by a porch or portico. The door opened into a hall in which the staircase still held pride of place, although its balusters and handrails were newly attenuated and its stair-edge detailing simplified. The rooms beyond this hall were generally square or rectangular in plan, even if dining rooms could be given a niche to accommodate a sideboard. Interior doorways were often pedimented, and enriched with fine-scaled paterae, swags, or urns.

Fireplaces were similarly decorated. Usually of wood, occasionally of marble, these were often the most Adamesque element within the structure. Typically, a small, relief-carved panel was centered under the mantelshelf, and surrounds were embellished with applied or carved designs. An especially elaborate example, carved by McIntire for Elias Hasket Derby and salvaged when the Derby house was demolished in 1815, exhibits an exemplary vocabulary of stiff-leaf, swags, fluting, garlands, classical figures, guilloches, rosettes, acanthus leaves, and lyres; only McIntire's signature vine, here rather naively executed, lacks the refinement necessary to Neo-Classical ornament. (The fireplace surround is now in the Metropolitan

Museum of Art, New York.) Other fireplaces, like some architectural trim, incorporated composition ornament purchased from London exporters.

Full panelling was retained only on the fireplace wall (although it was disappearing even here); the wainscot on the remaining walls rose to the level of the dado and whitewash, paint, or wallpaper was used between dado and cornice moulding. In grander houses the walls of the principal rooms would be papered, the papers often imported from England or France. During the late 18th century wallpaper was often plain with elaborate festoon or floral borders at cornice level and around the wainscoting and doors. After 1800, striped or floral papers were preferred and geometric and Neo-Classical motifs were common. The wealthiest houses used scenic or panoramic papers produced by French companies such as Dufour et Cie. and Zuber et Cie. Walls were generally broken by tall, nine-over-nine windows distributed more or less evenly across the façade (six-over-six units, sometimes triple-hung, eventually became standard).

Reception and bedroom floors generally consisted of wooden planks that were either left plain or were painted or stencilled. Hall flooring could be made of white or patterned marble or stone, and kitchen and service areas often used brick underfoot. Floorcoverings were quite varied and included painted canvas floorcloths with marble or geometric patterns and carpets. Loomed carpets were available to the wealthy after the 1790s and were usually patterned with scrollwork, polygonal shapes or floral and Neo-Classical motifs. They were generally cut to fit the shape of the room and were laid wall to wall and fixed to the floor with tacks.

Revealing the economic level of the owners, ceilings ranged from whitewashed boards, to plain plaster, to decorative work executed with plaster of Paris, putty, or papier-mâché. The backgrounds of elaborate ceilings could be strongly coloured, their swags, guilloches, and arabesques picked out in white, but this treatment diminished in importance after the turn of the century.

Many of the accessories that decorated Federal rooms – among them looking-glasses, picture frames, statuettes, porcelain, and earthenware – were imported, usually from England, but sometimes from France, Germany, or Holland. Still, a substantial number of looking-glass frames were domestically produced, particularly after 1800. (Polished glass was invariably imported, and usually imported as mirror, that is, silvered; there was only one silverer in New York in 1817, and even so late as 1872, the United States did not produce mirrored glass.)

More than many other pieces, looking glasses tended to retain the shapes of the Chippendalian Colonial style. Even in 1820, American merchants and makers offered (and presumably sold) frames with swan-necked pediments and bottoms cut in intricate but unidimensional curves, the whole oddly embellished with such symbols of the time as urns, swags, husks, and eagles. Other domestically produced forms were more genuinely Neo-Classical: the convex glasses that, despite their lack of candleholders, are known in America as girandoles; and those made in the "columnar" style associated with Sheraton. Many of the latter are topped by a entablature decorated with balls, and have a decorative panel of arabesques, bas-reliefs, seascape, or portrait at the top of the glass. Other looking glasses were hung within U-shaped stands and,

depending on size, were placed on either the floor or a dressing table.

If looking glasses were primarily foreign in origin, Federal clocks were primarily domestic. Like many mirror frames, however, tall clock cases were transitional in styling, mixing curved pediments with paterae, string inlay, and smooth bracket feet. Shorter versions were made to be placed on mantels, brackets, and shelves. Still, it was during this period that American clockmaking took a new turn, with the development of small and relatively inexpensive wall and shelf clocks. Around 1802, Massachusetts clock-maker Simon Willard developed an eight-day wall clock called the "banjo" because of its shape, much copied then and later. Some four or five years later, Eli Terry of Connecticut set up a factory with water-powered machinery, where he eventually produced thousands of wooden clock mechanisms.

The purely Neo-Classical phase of the Federal period lasted only some twenty years. By 1815, it had been submerged by the flamboyant lines and neo-archaic forms of English Regency and French Empire design that inspired the dual Greek Revival / American Empire period. One major source of inspiration for the new approach was *The London Chair-Makers' and Carvers' Book of Prices for Workmanship* (1802) and its supplement (1808). Of the Federal furniture makers, only Phyfe – who had experimented with the Greek and Roman idiom as early as 1805 – survived the change in styles.

Selected Collections

Examples of Federal Style furniture and some period rooms can be seen in the following museums: Winterthur Museum, Delaware; Baltimore Museum of Art; Boston Museum of Fine Arts; Brooklyn Museum, and Metropolitan Museum of Art, New York. Celebrated examples of Federal Style architecture and interiors survive in the Gardner-Pingree House, Boscobel, New York, and in the Harrison Gray Otis House, Boston.

Feure, Georges de 1868–1943

Dutch designer, painter and lithographer

Georges de Feure was the adopted name of Georges Joseph van Sluijters. He was born on 6 September 1868, in Paris, the son of a Dutch architect, Jan Hendrick van Sluijters and his Belgian wife. Although he was one of the most significant artistic figures in France between 1890 and 1905, much of de Feure's career is shrouded in mystery and he died in poverty, largely forgotten, in 1943.

De Feure's family fled France in 1870 after the outbreak of the Franco-Prussian War, moving from place to place in Holland and Belgium, wherever Jan could find employment. Apart from a brief period attending evening classes at the Royal Academy of Architecture, Amsterdam, in 1886, Georges's only formal education was at the Jesuit boarding school in Hilversum which he left in 1883. Between 1883 and 1886 he worked as a clerk in Utrecht and Dordrecht, as a bookseller's assistant in The Hague, and an odd-job man at an Amsterdam theatre where his duties ranged from bill-posting, scenery painting, and wardrobe assistant to part-time acting.

Arriving in Paris in 1889, he found lodgings in Montmartre where he associated with the painters, writers and musicians who crowded the café-cabarets of that area. During the next decade he established a reputation as a major graphic artist. Beginning with caricatures and illustrations for humorous or popular literary magazines such as *Fin de Siècle*, *Le Messager français*, *Le Boulevard*, and *La Butte*, he went on to produce cover designs and illustrations for books such as *Le Rêve* by Emile Zola (1888), *Fémines* by Octave Uzanne (1896), and, most significantly, *La Porte des Rêves* by Marcel Schwob (1898). He also worked in watercolour and gouache, producing work that was strongly influenced by Symbolist literature and painting.

By 1892 he had mastered the techniques of colour lithography, producing small edition prints as well as posters for magazines, groceries, circuses and café-cabarets. Many of these show pale, mysterious, often threatening women in a restricted palette of browns, greens and rose; others in a more garish palette of yellows, reds and blues are perhaps less successful. Although he might have been influenced by the poster artists Jules Chéret, it is unlikely that de Feure studied under him.

Heavily Symbolist in content, the principal themes of many

of de Feure's graphic works were the *femme fatale* or Sapphic love. During this period he exhibited at the Expositions des Peintres Impressionistes et Symbolistes (1892 and 1895); the Salon de la Rose & Croix (1893 and 1894); the Salon de Cent (1894-95); the Salons de la Société Nationale des Beaux-Arts in Paris (1894-98) and Brussels (1895). He held his first one-man show in Paris in 1894.

Around this time de Feure also appears to have developed an interest in the decorative arts. He was associated with André Marty in the establishment of *L'Artisan Moderne*, c.1894, for which he designed such disparate objects as a lithographed lampshade, tables, a table-rug, and the silvered bronze cane-handle of abstract whip-lash design between 1895 and 1896.

In 1899 Siegfried Bing invited de Feure to play a major role in the creation of what would become the single most significant exhibit at the Paris Exhibition of 1900. The Pavillon de l'Art Nouveau Bing was a single-storey structure with a façade decorated with canvases painted by de Feure, of female figures in contemporary dress as allegories of architecture, sculpture, metalwork, jewellery, pottery, glasswork and leatherwork. Of the six interior spaces in the Pavillon, de Feure was responsible for the total design of the dressing room and boudoir, as well as the stained-glass windows representing the Four Seasons.

In de Feure's dressing room, curtains of Japanese silk, furniture of natural Hungarian ash and wall coverings of figured silk in grey / blue, grey / mauve, grey / green decorated with white copper fittings, appeared "like a field of flowers under the moonlight". His boudoir was even more acclaimed. The wall covering was of grey silk brocade with a floral pattern, reflected in the silk embroidered gilded beechwood furniture, with a subtly carved floral decoration. The white marble fireplace was designed in the form of stalks supporting the mantelpiece. In this quintessentially feminine room de Feure combined 18th-century influences, with the *ébéniste* tradition of fine craftsmanship and the contemporary fascination with naturalistic organic forms associated with Art Nouveau.

Perhaps spurred on by this success, de Feure established his own atelier in partnership with the German architect Theodor Cossmann in 1901. He immediately received a commission for the interior of part of the Restaurant Knoss on the Boulevard des Italiens, where large panels of female figures were framed with green enamelled brickwork. At the same time he was engaged in designing porcelain for the Limoges company of Gérard, Dufraisseix & Abbot, which included teapots, jugs, cups, saucers, toothpick holders, trays, figurines and sweet-boxes, with floral designs or human figures in green and rose-mauve on a white ground. These were exhibited at the International Exhibition in Turin in 1902. He also continued to design furniture and decorations for Bing.

In recognition of his importance, de Feure was made a Chevalier of the Légion d'Honneur in 1901. Two years later he showed over 150 paintings as well as decorative art objects in Bing's gallery, including a fascinating series of landscapes – another new departure. Sadly, this venture was not a financial success, and due to increasing financial difficulties Bing's shop closed in 1904. A year later de Feure's company also closed.

Much of the remainder of de Feure's career is impossible to trace. He is known to have married in England in 1915, having divorced his first wife whom he had married in 1897, and he

was working in France again by 1929 where he stayed for the rest of his life. Later commissions included furniture and interiors for the Vionnet fashion house (1923), for which he designed 18 differently styled changing rooms. And in 1925 he designed and decorated the pavilion of Roubaix and Tourcoing at the Paris Exposition Internationale des Arts Décoratifs et Industriels Modernes, which was the showcase for French Art Deco. But despite developments in his style, de Feure's most distinctive work was essentially a product of fin-de-siècle Paris, to which he had made a major contribution in every aspect of the decorative arts.

Biography

Georges Joseph van Sluijters. Born in Paris, 6 September 1868, the son of a Dutch architect. Family fled Paris, 1870, and lived in various towns in Amsterdam and Belgium. Educated at boarding school in Hilversum until 1883; attended the Rijksakademie voor Beeldende Kunsten, Amsterdam, 1886. Had two sons with Pauline Dornec, 1890 and 1891; married Marguerite Guibert, 1897 (divorced); second marriage, 1915. Lived in Paris from 1889; worked as an illustrator and painter during the 1890s; first one-person exhibition, 1894. Associated with André Marty's *L'Artisan Moderne*, c.1894, and began designing furniture and decorative art items. Head of the design department for Siegfried Bing's shop *L'Art Nouveau*, Paris, 1900-04; ran his own studio, *L'Atelier de Feure*, in partnership with the German architect Theodor Cossmann, 1901-05. Worked for a period as a stage designer in England. Active in Paris as a decorator and designer of furniture, textiles, ceramics and metalwork, from c.1923. Exhibited at the 1900 Paris Exhibition, 1902 Turin Exhibition, and 1925 Paris Exhibition. Founder-member, *Société Moderne des Beaux-Arts*, 1900, and *Salon d'Automne*, 1902. Chevalier, Légion d'honneur, 1901; Officier, Légion d'honneur, 1923. Died after a long illness in Paris, 26 November 1943.

Selected Works

Examples of de Feure's furniture are in the Musée des Arts Décoratifs, Copenhagen, and the Musée des Arts Décoratifs, Paris. Examples of his stained glass are in the Virginia Museum of Fine Arts, Richmond.

Fireplaces. *See* Chimneypieces

Firescreens and Polescreens

The firescreen is an adjustable or fixed screen designed to protect persons seated in a room from the direct heat of an open fireplace. It can also be pushed in front of the fireplace when not in use, to serve as a decorative element. Firescreens first appeared in the 17th century, having been used in England as early as the reign (1625–49) of Charles I. They were part of a general trend towards greater numbers and varieties of furniture pieces in the houses of the wealthy and middle classes in England, North America, and continental European countries.

Firescreens were finely crafted pieces of furniture suitable for the most formal room settings. In addition, the screen panels of needlework, tapestry, beadwork, leather, or painted wood were highly decorative. Tapestry was often used when the screen was part of a matching set of furniture and hangings. However it was as vehicle for the display of needlework that the firescreen has maintained its popularity even to the present day. Canvaswork petit-point (tent stitch) was most often used, but crewel embroidery in wool on linen was also suitable since the screens were not subject to wear. Pictorial scenes, floral arrangements, ornamental maps, genealogical charts, and family coats of arms were mounted on the side of the panel facing into the room away from the fire. Succeeding generations often replaced the needlework in old screens with work of their own. Berlin woolwork pictures were used in the 19th century, and embroidery in a mix of styles has been employed in the 20th century.

In Great Britain and North America firescreens were made from designs by Chippendale, Hepplewhite, Sheraton, and other furniture designers of the late 18th and early 19th centuries. Chippendale polescreens, in particular, were elegantly made with tripod legs, claw feet, and Chinoiserie fretwork.

There were three main kinds of firescreens. The polescreen, with a sliding screen on a turned upright pole, four to five feet tall, supported on a tripod base, was also known as a screenstick in the late 17th century. The screen, often of needlework or beadwork, was at first rectangular, but oval and shield shapes became fashionable in the late 18th century. In some cases the tripod was replaced by a solid base, and the screen became a banner of velvet or other fabric with tassels that hung from a bar on the upright pole. In the early 19th century some English polescreens were made in the French Empire style with claw, ball, or scroll feet and Egyptian motifs, inspired by Napoleon's campaign in Egypt. When the pole was fitted with a shelf to hold a candlestick, it was called a polescreen candlestand. Small candle polescreens less than two feet high were made to sit on tables and shield a candle flame.

The horse or cheval screen, consisted of two uprights, each balanced on trestle feet, with a rectangular panel between. The panel was either fixed in place or made to slide up and down in grooves in order to adjust the height. The word horse in this instance indicates a large object, often used in connection with mirrors. Thomas Sheraton in his *The Cabinet-Maker and Upholsterer's Drawing-Book* 3rd edition, 1802, states that horse screens were about three feet six inches in height and about 19 inches in breadth. Elaborate carving and gilding were often used on these screens until the end of the 18th century, when lighter and simpler screens were in vogue. Needlework, tapestry, beadwork, or paintings were used for the panel in designs that included Chinoiserie, classical figures, flowers, and landscapes. Horse screens used in America were generally imported from England.

The third type was the small folding screen consisting of two panels on legs that were hinged together to stand upright when set at an angle. In the 17th century folding screens with painted leather panels were made, chiefly in Spain, but also in France and the Low Countries. After the restoration of Charles II (1660) leather screens in continental style were made in England. Needlework was also used for the panels.

Variations included the firescreen desk, a shallow drop-front desk box set vertically between footed uprights, serving as a firescreen and a desk. When closed, the desk appeared similar to the horse screen. The front panel dropped down to form a horizontal writing surface with storage area for paper and pens. These date from the 1780s. In the early 19th century they sometimes had a wooden panel extending almost down to the floor. The firescreen table, made from the mid 18th century, was a four-legged tea table, the screen being a sliding frame attached to the two back legs and covered with a heavy fabric or a painted panel of japanned metal. Hand-held screens resembling flat fans on sticks also protected the face from the fire.

Like the open fire that it is designed to screen, the firescreen has become a purely decorative feature in the modern house. The flat screen surface is still eminently suitable for the display of needlework or small pieces of tapestry. Some new screens in period styles are being made for historic houses and other formal room settings. Crewel embroidery and canvaswork of all kinds continue to be made by 20th century needleworkers who find the firescreen a convenient means of display.

Fischer von Erlach, Johann Bernhard

1656–1723

Austrian architect

Johann Bernhard Fischer von Erlach was the Imperial architect of the Hapsburg emperor in Vienna at the end of the 17th and early 18th century. His late Baroque style in architecture and interior decor is an amalgam of the Italian Baroque, with which he was familiar from study in Rome, and the French Baroque and newly developed Rococo which he knew from books and travel. Also a sculptor, Fischer von Erlach designed palaces, sculptural monuments, and many churches which provide much of the extant evidence regarding his ideas on interior decoration.

A scholar of the history of architecture, Fischer von Erlach published a landmark illustrated text called *Entwurf einer historischen Architektur* (Historic Architecture), 1721. Historicism infused his architecture. But he was a man of his times and chose his decorative formats to match the dignity and purpose of the individual works he conceived.

An early work, the Ancestral Hall of the Althan Family at their Schloss Frain, Moravia (1688) is a monumental free-standing oval hall rising to a soaring oval cupola. Set into the vault are ten vertically placed oval windows which light the ceiling's illusionistic frescoes, depicting the history of the family, painted in 1695 by Johann Michael Rottmayr. The walls of the lower register alternate French windows and wall segments that are articulated by two Corinthian pilasters with a large niche, holding statues of famous members of the Althan family within them. A filigree of white stucco floral motifs, surrounding bas-reliefs, covers the other wall surfaces.

In 1696–1700, Fischer von Erlach designed a City Palace for Prince Eugene of Savoy, commander of the Imperial armies. Twelve original exterior bays are articulated by giant Ionic pilasters. Entry is through a vaulted vestibule whose walls are covered with delicate Rococo stucco work. A well-lit stairhall to one side gives access to the upper storeys of the palace. The first flight of stairs is flanked by four large atlantes (carved by Giovanni Giuliani) and opens through the entire palace. Fischer von Erlach's use of decorative balustrades, the open character of the stairhall, and the use of sculpted atlantes was

to resonate in the interior decor of other later palaces of the Viennese 18th century.

Another magnificent staircase is to be found in the Batthyány Palace, Vienna. This staircase consists of three flights and is symmetrical, and it occupies the whole of the right-hand side of the central area of the Palace. It is approached through the vestibule which contains four pairs of heavy Tuscan columns, holding up nine cross-vaults, supported at the walls by rusticated pilasters. Unlike the vestibule, however, whose stark and severely undecorated style evokes an air of monumental simplicity, the staircase is richly and elegantly decorated and is enriched by vases and niches with shell motifs and masks that recall the ornament of 17th-century Holland.

Outside of Vienna, Salzburg is the site of the largest number of works by Fischer von Erlach. One of them, the University Church (Kollegienkirche), 1696–1707, is representative of his ideas on sacred design. Its powerful façade is composed of a convex central section flanked by towers. Giant Ionic pilasters, stuccoed garlands, and roofline figural sculpture decorate a façade whose surfaces are painted in umbers and beige.

In plan the University Church is a cross set within a rectangle. There is a Latin dome over the crossing and four oval chapels, with galleries above, lie on the corners. The monumental interior, stuccoed and painted entirely in white, soars vertically above a stone floor. Giant Corinthian pilasters rise on 14-foot bases to create Roman triumphal arch motifs along the barrel-vaulted nave. These terminate in an entablature whose frieze is a running band of Antique motifs in stucco, designed by Fischer. Between the pilasters double niches, each containing a life-size sculptural figure of a saint, were placed.

The interior is well-lit from large arched windows, from the dome, from oval "bull's-eye" windows (a Fischer favorite) in the apse and on the entry wall, and from oculi cut into the vaults of the chapels. Here the architect is following an 18th-century preference in the North for well-lit interior spaces. The orchestration of decoration culminates in the apse. Set behind a traditional balustrade, the high altar is flanked by two free-standing Palladian columns. The altar, although not Fischer's original conception, perfectly fits the space. A stucco glory of clouds and angels, with the Immaculate Virgin in the center, covers much of the wall surface and surrounds two large windows on the back wall.

The commission for the Imperial votive Saint Charles Borromeo Church (Karlskirche) in Vienna, 1715–38, came from Emperor Charles VI. Its iconographic program both embraces the life of the emperor's patron saint and aggrandizes the Imperial family. The historiated entry façade carries a Roman-style portico connected by concave wall segments, before which colossal Trajanic columns stand, to low bell towers. A broad Latin dome covers the large oval congregational space of the interior. To this centralized space, rectangular arms are appended on the cross axes and, on the diagonal axes, smaller rectangular chapels with galleries above, are inserted. The church's interior space has a rich complexity similar to that found in Italian Baroque architecture. All of the openings into the principal space are arched. Fischer von Erlach's familiar giant-order Corinthian pilasters standing on high bases elegantly encircle the room. Single storey paired free-standing columns mark the entry into the cross arms.

Fischer von Erlach: central oval hall, Imperial Library, Vienna, 1722–30

Differing from Fischer's usual church interiors, both pilasters and columns are of dark veined marble and their capitals are richly gilt.

To complete the decorative ensemble of the St. Charles Borromeo church interior, as was true of secular interiors of the period, sculpture was added. Fischer orchestrates figures of saints and angels, stucco swags and other ornaments within the interior. Also, he gives rich sculptural expression to those other two basic church accessories – the pulpit and the organ loft and its casing. In the extended choir and apse, the high altar too is given definition through a sculptural ensemble (white and gold in color). Between marble Ionic columns, a statue of St. Charles Borromeo ascending to heaven is seen.

Among the many impressive libraries built during the Austrian Baroque period, Fischer von Erlach's Imperial Library, Vienna, 1722–30, is the best-known and most monumental in scale. A wing of the Imperial Hofburg Palace, the Library's spatial conception is based on Fischer's knowledge of Ancient Roman architectural forms. The longitudinally placed oval central hall (dimensions 77 metres by 14 metres) is flanked by rectangular wings sub-divided into two sections by free-standing marble columns and enclosed circular stairways. The stairs lead to the second storey balustraded gallery which is held by carved and gilded wooden brackets in the wings and by free-standing tapered wood piers in the central oval hall. Built-in bookshelves made of finely carved and gilt wood reach from the marble floor, through the gallery level, to the springing of the vaults.

The imagery of the Imperial Library's centralized oval hall celebrates the Hapsburg Dynasty. A marble statue of the ruling emperor, Charles VI, patron of the Library is placed in the center of the space as defined by a medallion pattern on the marble floor. Statues of the Emperor's ancestors stand on high podia before the tapered piers of the gallery. The enormous ceiling fresco, lit by bull's-eye windows, was painted by Daniel Gran in 1730. It is filled with allegorical imagery alluding to the power of the emperor and to his patronage of the arts and learning.

The many Imperial commissions Fischer von Erlach received suited his taste for large-scale projects, which, while alluding to the past, successfully incorporated the latest aesthetic impulses from Baroque architecture.

BEVERLY F. HEISNER

Biography

Born in Graz, baptized 20 July 1656, the son of the sculptor Johann Baptist Fischer. Trained as a sculptor in his father's workshop. Went to Rome, 1671; worked under the architect and painter Phillip Schor, and in the studio of Bernini; employed as Schor's assistant in Naples, 1783. Married 1) Sophia Konstantin Morgner: 5 children including the architect Joseph Emanuel Fischer von Erlach (1693–1742); 2) Franziska Sophia Willer, 1705. Active as an architect in Vienna and Graz from 1687 and also in Salzburg from the 1690s. Appointed architectural tutor to Joseph, elder son of the Emperor Leopold I, 1689; joined the court of the Emperor Joseph, 1694; raised to the nobility, 1796; appointed chief inspector of court buildings, Vienna, 1705. Travelled to England and Holland, 1704; and to Venice, 1707 and 1717. A scholar of architectural history, he published the influential *Entwurf* in 1721. Died after a long illness in Vienna, 5 April 1723.

Selected Works

For a complete list of Fischer von Erlach's architectural works see Aurenhammer 1973.

Interiors

- 1688–95 Schloss Frain, Moravia, Czechoslovakia (ancestral hall)
- 1690–93 Althan Garden Palace, Rossau, Vienna (building and interiors)
- c.1693 Hunting Lodge, Engelhartstetten (building and interiors)
- 1694–1702 Dreifaltigkeitskirche, Salzburg (priest's house and college; building and interiors)
- 1696–1700 City Palace of Prince Eugene of Savoy, Vienna (building and interiors)
- 1696–1707 Kollegienkirche, Salzburg (building and interiors)
- 1696–1711 Schönbrunn Palace, Vienna (plans, building and interiors)
- 1698–1705 Batthyány Palace, Vienna (building and interiors)
- 1700–09 Klesheim Palace, Salzburg (buildings including garden house and interiors)
- 1710–16 Trautson Garden Palace, Vienna (building and interiors)
- 1715–38 Karlskirche, Vienna (building and interiors)
- 1716–18 Herzogenburg Convent, Lower Austria (central part of east wing, great hall and staircase)
- c.1716–19 Hofburg Palace, Vienna (project for revisions)
- c.1720 Schwarzenberg Garden Palace, Vienna (alteration and interior decorations)
- 1722–30 Imperial Library, Hofburg Palace, Vienna (building and interiors)

Floorcloths

The term floorcloth is a slightly problematic and misleading one. In the 18th century it referred to any treated or untreated cloth laid on the floor, and included materials such as baize and drugget which were frequently used to cover more expensive carpet, especially in dining areas. By the 19th century, however, floorcloth was more often used to describe cloth treated with an evaporating oil and painted to make it waterproof. Such cloth was also called oilcloth or waxcloth, and it is to these materials that the term floorcloth usually refers today.

The precise origins of floor oilcloths are still obscure. While there are references to painted cloth and to "oyl" cloth in the 15th and 16th centuries there is no clear evidence that they were used on floors until the early 18th century by which time they appear to have become common in both Britain and America. In 1728, the estate inventory of Massachusetts governor, William Burnet, referred to two painted oil floorcloths. In 1738, the *Encyclopedia of Architecture* warned against using painted floorcloths because they would trap moisture and promote rot in the wood flooring. In 1750, the writer Dr. Samuel Johnson recorded his disdain at a friend's efforts to impress him with a new and brightly painted floorcloth. And in 1760, the *Maryland Gazette* carried an advertisement for one John Winters that claimed he could "paint floorcloths as neat as any imported from Britain."

The early floorcloths were usually made in two-to-three-yard squares of linen, hemp or cotton and had to be seamed together for larger sections. The process of sizing the cloth and covering it with successive layers of paint was done by hand as was the painting of the designs which were either stencilled or painted freehand. Popular patterns included plaited mat, Turkey carpet and a variety of Neo-Classical designs. During the mid and late 18th century painted floorcloths were frequently used in passages, on stairs and in entrance halls. Their waterproof properties also made them suitable as a protective covering for expensive carpets under sideboards and tables in dining rooms. A fine example dating from the 1780s survives from the hall at Workington Hall, Cumbria, and another floorcloth imitating a luxurious oriental carpet is recorded in the Attingham Park sale catalogue of 1827 as having been used in the Grand Dining Room.

The earliest recorded factory for making floorcloths was established by Nathan Smith in Knightsbridge, London. His 1763 patent indicates that there was already a commercial trade in floor oilcloth, but that he intended to introduce a new process for its manufacture. Smith is credited not only with the first factory, but also with the first printing block for creating

designs on the floorcloth. By the end of the 18th century, there were at least twenty floor oilcloth factories in England, and by the end of the first decade of the 19th century, there were several in the United States as well.

The Industrial Revolution had a major impact on the production of floor oilcloth. The technological advance of the flyshuttle in the early 19th century meant that wider lengths of canvas could be produced. In sailmaking centers like Dundee and Kirkcaldy in Scotland, weaving factories began to produce heavy canvases in widths of 18 to 24 feet specifically for the floorcloth trade. This meant that seamless wall-to-wall floorcloths could be produced.

In August 1842, the London *Penny Magazine*, published by the Society for the Diffusion of Useful Knowledge, reported, "A Day at a Floorcloth Factory" (pp.337-344) and gave a full account of the manufacturing process. Canvas was stretched on large vertical frames and men working on scaffolding brushed and troweled both sides of the canvas with sizing. After drying, it was pumiced and a second coat was added, allowed to dry and pumiced again. Successive layers of thick paint were then applied with each layer drying thoroughly before the next was added. The cloth resembled a flexible, well-tanned hide by the time it was ready for its final sanding, painting and decorating.

In a manner similar to wallpaper printing, patterns were applied with wooden blocks that were usually eight to 24 inches square. Separate blocks were used for each color, but they could not overlap because the paint was so thick it would have created an uneven surface. In the final step, the floorcloth was hung in large, heated drying rooms and required six months or more of "curing" or "seasoning."

While 18th-century floorcloth had been made largely by hand and was frequently found in the homes of the well-to-do, 19th-century industrialization made floorcloth more affordable and it appeared in the homes of the middle class, and, by the end of the century, even the poor. Popular designs were usually imitative of tile, marble, or carpet. One outcome of the printing process was that the designs looked as if they were based on a dot matrix. This is because in order to cover large color areas, channels were cut into the wood blocks to give them "teeth" to hold the ink. The resulting pointillistic pattern resembled the woven texture of carpet. In 1851 at the Great Exhibition, the judges' criticism of this effect led the Scottish firm of Nairn to create blocks with a much smaller grid of squares. When all the color blocks had been printed, they used a "mash block" to blend the areas and give overall even coverage. Finally they used a block with metal strips to outline the different color sections and give them more definition.

By the end of the 19th century, most of the procedures for creating floor oilcloth had been mechanized. Although it continued to be marketed well into the 20th century, it was eventually superseded by the new development of linoleum.

There were various experiments in the early 19th century with rubber-based floor coverings, and Kamptulcan, patented in England by Englishman Elijah Galloway in 1844, was one such effort. But it was expensive and never achieved the widespread acceptance that linoleum was to have. Linoleum was invented by another Englishman, Frederick Walton, in about 1860. Legend has it that one day Walton peeled off a skin of oxidized linseed oil from the top of an open paint jar. Playing

Floorcloths: trade advertisement showing a variety of linoleums from Whiteley's of London, mid-19th century

with the rubbery film gave him the idea that eventually led to his invention of linoleum. He named it from the Latin *linum* for flax and *oleum*, for oil.

Basically linoleum is oxidized linseed oil mixed with ground cork dust, gums and pigments which are then pressed through heavy metal rollers onto a canvas backing. Walton set up his first factory in 1864 in Staines, near London, and by 1866 the Linoleum Manufacturing Company was reporting steady sales. By 1869, they were exporting their product to the Continent and the United States.

The advantages of linoleum over oilcloth were that it was thicker, more waterproof, resilient, and much longer-wearing. Its popularity was such that the older oilcloth trade began to imitate it. In 1877 Walton instituted legal proceedings against the Nairn Company for infringement of his product and trade-name. But in 1878 the British Courts ruled against him. Walton had never actually registered the name linoleum. The ruling stated that even if he had, he could no longer have exclusive use of the name since linoleum had become a commonplace term and was the only way to describe the product.

Although Walton was soon in competition with numerous rivals, his company continued to expand their markets and sold their patents to firms in Germany, France and the United States. Walton went to the United States in 1872 and spent two years setting up the American Linoleum Manufacturing Company on Staten Island. He named the factory and company town he created "Linoleumville." Other American firms founded to make oilcloth soon began to make linoleum as well.

The next major technological improvement was the introduction of "inlaid" linoleum. Earlier linoleum had been all one color, which had offered an advantage over oilcloth because it would hide wear. When designs were wanted, the linoleum was painted much like the oilcloth and eventually showed the same kind of wear. In 1882, Walton created a way for the color patterns to go all the way through to the back thus greatly expanding the life of the material.

The first experiments with inlaid linoleum were done by hand, but by 1892 Walton had successfully mechanized production and in 1898 he set up his own manufacturing company, Greenwich Inlaid. Inlaid linoleum was long-wearing,

but it was also more expensive and the earlier painted versions continued to be produced.

By 1910 there were prominent linoleum firms in Germany, France, the United States and Canada that competed with the older British companies. In America one of the most important was the Armstrong Cork and Tile Company. It began producing linoleum in 1908 and eventually came to dominate the American industry.

Linoleum was a world-wide product in other ways as well. Linseed oil came largely from South America, cork came from Spain and Portugal, jute came from Pakistan and India and was processed into the canvas backing in Scotland. Linoleum was also used world-wide, especially where the British Empire had established footholds. World War I greatly disrupted this network, but it quickly re-established itself in the post-war period.

In the 1910s cheaper felt-based versions of linoleum were developed. Congoleum is the best known example and it enjoyed wide popularity as a cheap substitute for linoleum. It did not wear as well or as long and was not as waterproof, but it was so cheap, it could be easily replaced. It was especially popular in rug-like widths and its patterns often imitated carpet. Armstrong's version of it was called "Quaker Rugs."

Linoleum remained one of the most popular floor coverings from the 1870s to the 1960s, but was eventually replaced with plastic-based products. Today most of what people call "linoleum" is vinyl floor covering.

The appeal of linoleum was that it was practical, durable, decorative, waterproof, inexpensive and easy to clean. It was also considered sanitary and therefore suited to bathrooms, nurseries, and kitchens. Unlike the earlier oilcloth, it was resilient, which gave it sound-proofing qualities and made it more comfortable. It was promoted for businesses and factories where people had to stand for long periods. A special grade of thick, solid-color linoleum called "Battleship" was developed and used on both American and British naval vessels as well as on yachts and ocean liners. It was so durable that it also became popular for use in government buildings including post offices, courthouses and schools.

The decorative qualities of linoleum also proved especially appealing. It offered "art" at an affordable price and was produced in an amazing variety of designs; by 1918 Armstrong was advertising 380 different patterns and added new ones every year. Most were imitative of other materials and popular lines included mosaic, tile, parquet, granite, marble, and carpet designs. This imitative quality led to criticism and elitists scorned linoleum as a cheap and inartistic material. Nevertheless, linoleum was incredibly popular. Mass production had made it widely available; mass advertising had made it well known, and popular taste made it a success. Linoleum was the "democratic floor covering" of its age.

Floorcoverings

There is a fundamental difference in the attitude of eastern and western societies regarding the use of floorcoverings. In eastern countries, and in many tribal societies, the floorcovering is treated as part of the furniture, and many activities are carried out by householders while seated on the floor. Street shoes are left at the door, and bare feet or soft slippers are worn in the house. In western societies rugs are used decoratively to add color to rooms, define room areas, and add warmth to cold floors. Bare feet and slippers are considered too informal for social wear, street shoes are commonly worn in the house, and only children use the floor. As a result, floorcoverings in the west are subject to heavier wear. Fine carpets are commonly used in rooms such as parlors and dining rooms where they do not receive the heavy foot traffic of the house, while utilitarian rugs and carpets are used in other areas of the house.

Animal skins were probably the first floorcoverings, followed by coarse plain weave fabrics and mats. Mats were woven of reeds, straw, rushes, palm leaves, bamboo, or other locally available fibers, and served for sleeping, eating, and other activities. A mat weaving process similar to basketry was used in Mesopotamia as early as c.5200 BC. The usual methods of making matting were to join bundles of fiber together by a twined thread or to weave the fibers in a simple plain weave.

In tropical areas *tapa*, or beaten bark cloth, was also used. Matting was the most commonly used floorcovering in Europe from the 16th to the 18th century. Tudor portraits frequently

show rooms with traditional rush matting on the floors and samples of 17th century bullrush matting have been discovered at Hampton Court. During the Restoration period, these thick utilitarian floorcoverings were replaced by more finely-woven and decorative, often brightly-colored examples imported from Portugal, North Africa and Holland, and a Kensington Palace inventory of 1697 notes Portuguese mats in the principal bedchambers as well as the King's Drawing Room and Privy Chamber. By the second half of the 18th century, matting was confined to areas such as passages and halls but it was revived again during the Victorian and Edwardian periods when cheap Oriental mats flooded the European market.

In early times bed furniture was rare, and floorcoverings often served as bedding for persons sleeping on the floor. With regard to use, there was little distinction made between rugs, carpets, and blankets. The word rug itself is derived from the Scandinavian word *rugga* which meant a wool covering for the bed or body.

The earliest carpets were flat-surfaced weaves. The tapestry weave, in which the pattern is formed by discontinuous weft threads, is believed to be the oldest. The kilims of Turkey, Persia, the Caucasus, and Turkestan, as well as Indian dhurries and American Navajo rugs are woven by this method. Kilim designs incorporate many traditional motifs having symbolic meaning. Another flatwoven rug, the Soumak, was made in the Middle East and the Caucasus as early as the 7th century BC. In this weave, which is a variation of brocade, the weft threads are wrapped around pairs of warp threads in a lateral direction making a herringbone pattern on the surface and leaving many loose threads on the back.

Tapestry rugs, called *tapis sarasinois*, were first made in Aubusson, France, in the 8th century by Moors living there. The production of tapestry rugs and wall hangings increased in the 13th century when artists from Flanders moved to Aubusson. Aubusson production after the French Revolution was limited to carpets and upholstery. Aubusson has become the generic name for French flatwoven carpets.

Non-woven wool felt rugs have been used for at least 2000 years in Asia. They were made by nomads in Central Asia and Mongolia as yurt furnishings, and were exacted as tribute by the Chinese who used them as cushion covers and kneeling mats. Felt rugs were often decorated with appliqué, and embroidery in bold designs. A felt rug called *namda*, or *numdah*, has been made in India for many centuries. Recent *namdas*, exported to the west, have large chain stitch embroidery designs.

The pile rug or carpet is more durable than the flatwoven rug, and is the most commonly used floorcovering in temperate regions of the world. Carpet looms are generally the same as those used for tapestry. The pile is created during the weaving process by a series of threads knotted around the warp threads between rows of straight wefts. The symmetrical Ghiordes knot, used mainly in Turkish and Caucasian rugs, and the asymmetrical Persian (Sehna) knot, used in Persian, Central Asiatic, Indian, and Chinese carpets, are the two types of knots used. After each knotted row a weft thread is carried across the full width of the loom and beaten into place. When the carpet is finished the pile is cut to an even surface, and a fringe is formed of the warp ends. The pile gives the rug softness and creates an insulation barrier over the cold floor.

Floorcoverings: knotted wool pile carpet, Ushak, Turkey, 17th century

The earliest pile rug now extant was found frozen in the Pazyryk tombs of the Scythians in the Altai Mountains of Siberia. It is now housed in the Hermitage in St. Petersburg. This rug, which dates to c.500 BC, is very sophisticated in design and technique, leading scholars to believe that pile rug weaving in Central Asia developed as early as 2500 BC. From very early times the nomads of Central Asia and Mongolia used pile rugs as floors in their tents and yurts. Although there is a gap in the historical record of extant specimens until 1200 AD, rugs have been made continuously from the time of the Scythians and are mentioned by travellers and other writers. 13th-century fragments found in Turkey demonstrate that geometric patterns forming the basic design structure of rugs in that area were already well established.

Nomadic rug weaving is done by women on portable looms that can be rolled up and transported from place to place. The rugs are not large, and it was not until weavers settled in cities that large rugs on high vertical looms could be woven. Rugs are woven from bottom to top in either flat or knotted pile weave. The most commonly used material is sheep's wool, although in some regions goat's or camel's hair is used. Luxury carpets made in Persia or China may have a silk pile. Natural dyes were used exclusively until the late 19th century when aniline dyes were introduced from Europe. Aniline dyes are not colorfast, and many rugs with these dyes have faded.

When Marco Polo passed through Anatolia in the 13th

Floorcoverings: drawing room, The Close, Winchester, 1847; watercolour by Beatrice Olive Corfe

century, he described Turkish rugs as the finest in the world. Turkish rugs had geometrically stylized designs. The city of Ushak was an important center of carpet-making by the 16th century, and supplied the export market. Ushak carpets had two main types of design – medallion or star. Some Turkish rugs had borders of often meaningless Kufic script lettering. Writing was considered to have magic properties, and was incorporated into rugs and other decorative objects without regard to the literal meaning of the script.

When Oriental rugs were first imported into Europe from Turkey in the 14th century they were considered too valuable to put on the floor, so they were draped on tables, cupboards, and chests as decoration. Many paintings of the 14th through the 17th centuries, particularly those of Hans Holbein the Younger and Lorenzo Lotto, show such table rugs. This practice continued throughout the 17th century and carpets remained rare items with only rich and high-ranking persons having carpets underfoot. Oriental rugs were used on floors of wealthy homes in North America from the 18th century onward but they were still sufficiently rare that visitors often hesitated to walk on them. The carpet was placed in the center of the room as a showpiece, with tables and chairs arranged around the perimeter against the wall.

Rug making spread with Islam throughout Central Asia, the Middle East, India, China, North Africa, and the Iberian peninsula. Distinctive designs were developed in each place. Oriental rugs were named by their point of origin, although in some cases the name was that of the trading city (i.e., Samarkand), rather than the home of the weaver. The carpet trade with the west has continued through political upheavals and changes in consumer taste. Western consumer preference has affected both the design and coloring in carpets made for market since carpets were first exported.

Traditions of rug making were highly developed in Persia by the 16th century. The Safavid rulers in Persia established court workshops that produced densely woven carpets in naturalistic designs designated as medallion, garden, flower, vase,

animal, or hunting carpets depending on the principal motifs. Many designs were influenced by Persian court painters who supplied cartoons for weaving patterns. Flower designs characterized the regional and village carpets of Persia.

Magnificent carpets were woven for the palace and other buildings in the new capital of Isfahan during the reign (1587–1628) of Shah 'Abbas I. During this time Persian carpets were first exported to Europe, where they were called "Polonaise carpets" from the mistaken idea that they were made in Poland. The finest Persian carpets were woven in the 16th through the 18th centuries. After 1850 weavers worked mainly for export to the west, and designs lost their originality. The introduction of aniline dyes in the 1870s had a further detrimental effect on quality. In 1934 the Iranian government prohibited the export of inferior quality carpets. 20th-century carpet weaving centers in Iran include the cities of Herez, Sultanabad, Tabriz, and Tehran.

Persian-style carpets were also made in China, but Chinese rugs had, and still have, a distinctive style of their own. They tend to have symbolic floral or geometric designs with the motifs much more widely spaced. Often the pile is sculptured so that the motifs stand out in relief. Color schemes are pale with yellow, blue, and white predominating in large areas of solid color. Chinese rugs have a soft pile that is not as resistant to wear as other oriental rugs.

Moorish influence produced two types of folk rugs in the Iberian peninsula, the Alpujarra rug of Spain, and the Arraiolos rug of Portugal. The Alpujarra, named after a city near Granada, is a coarse, heavy rug worked in loops similar to a hooked rug, and had its first use as a bed cover. The Arraiolos is a flat embroidered rug worked in long-legged cross stitch on a jute canvas backing. The design motifs and composition of these rugs are similar to Persian carpets and mosaic tile floors.

Hand-knotted pile rugs in Baroque style were made in France at Savonnerie. The original factory was established by Louis XIII in 1627 at the site of an ancient soap factory in

Chaillot, and was the most important European manufacturer of knotted pile carpets. Production was limited to the court until 1768 when the carpets were made available to private individuals. Savonnerie became a generic name for this type of French carpet, which was the prototype for western carpet design. In 1825 the Savonnerie factory was incorporated into the Gobelins tapestry works.

The most distinctive rug in Scandinavia is the *rya*, or *ryijy*, worked in a knotted pile weave technique that goes back to the Bronze Age. In the Middle Ages *ryas* were used as cloaks and bed covers, and now in modern times they are used on floors or hung on walls. The *rya* is woven with single rows of pile separated by 10 to 20 weft rows. The long pile hides the unknotted areas. Sometimes the knotting is worked by hand on a prewoven background that has holes spaced at the proper intervals. Originally made from wool in natural colors, the *rya* has evolved into a colorful work of art in the 20th century.

Less expensive alternatives to imported carpets were developed in Europe and North America. In the 18th and 19th centuries, painted canvas floorcloths were used in affluent American homes including those of George Washington and Thomas Jefferson. Designs were copied from carpets, marble floors, and stenciled patterns. The cloths were imported from England, or were made locally by sign and coach painters. Floorcloths went out of use when linoleum and vinyl floors became common, but they have recently been revived for period interiors.

Woven rag rugs were common in early America, and remain popular in rural areas where they are woven on home looms. The rag rug has a weft made of narrow strips cut from old clothes or other rags and is woven on a cotton warp in plain weave. The rags may be dyed to form stripes or woven as is to make a multicolor hit-and-miss design. Rag rugs were often used to cover expensive pile carpets in heavily trafficked areas or were sewn together to form wall-to-wall carpeting or covering for stair treads. They are very durable and are easily laundered.

The 19th-century hooked rug also utilized used cloth, primarily wool, cut into strips and hooked into a linen, cotton, or jute backing to form raised loops on the face of the rug. The loops were left uncut, giving the rug a tight, somewhat curly appearance. Hooked rugs were noted for their somewhat naïve floral and pictorial designs, although many were made from commercial patterns. Usually made by housewives, they were sometimes also made by sailors on board ship or resting in port. They are now made by home craftsmen. A related type of rug developed in England, the latch-hook, is worked in pre-cut yarn pieces with a special latch-hook tool. It has a cut pile, and resembles a short-pile *rya*.

Braided rugs also use wool rags sewn together and braided into a continuous strip. The strip is coiled into a flat, oval rug and the coils stitched edge-to-edge to hold them together. Braided rugs can also be made of rope or cord. Large braided rugs are extremely heavy, and provide good insulation on cold floors.

Embroidered canvaswork, or needlepoint, rugs are another alternative to expensive carpets. They are usually worked in wool using the half-cross tent stitch or the cross stitch on a canvas background. In the 16th and 17th centuries they were made by amateur needleworkers in imitation of Turkish

Floorcoverings: designs for stone or painted floors by John Carwitham, from *Various Kinds of Floor Decoration*, 1739

carpets and were used on tables. In the 18th century floral patterns predominated, and canvaswork rugs were used on floors. Berlin woolwork designs were popular in the 19th century.

Handmade rugs continue to be made in the 20th century, mainly by artists and home craftsmen. The Arts and Crafts movement of the late 19th century led by William Morris revived interest in the rug as an art form. Recently museum reproduction canvaswork rugs have been worked in China for sale in the west. These are large rugs, worked on a vertical frame by several people. Commissioned reproduction oriental pile rugs using natural dyes are now being woven in India for sale in American galleries.

The Industrial Revolution in the 18th century saw the introduction of machine-woven carpeting. There were three basic kinds of machine-woven rugs in England: Wilton, Axminster, and velvet. Wilton first produced Brussels carpeting, a durable carpet with the pattern formed on the surface by uncut looped

warp threads on a woven foundation of linen, jute, or cotton. Cut pile Wilton carpeting was developed from this technique. The Wilton loom used a Jacquard system of perforated cards (invented 1805), and after the 1850s a Bigelow power loom. The number of colors was limited, but very intricate patterns with great clarity could be produced on the cut pile surface.

Axminster carpets, also named for a town in England, had a large choice of stylized geometric or floral designs and colors. The Axminster carpet, originally knotted by hand in the oriental manner, had a cut pile and a heavily ribbed back. The three types of Axminster carpet were designated chenille Axminster, spool Axminster, and gripper Axminster, based on the type of loom used.

Velvet carpets had a simpler weaving technique than the other two and were characterized by a large number of possible texture effects, including plushes, uncut loop piles, and sculptured effects.

The increased availability of manufactured carpets in the late 18th century and throughout the 19th century caused floorcoverings of this kind to become more common in European and American interiors. Machine-made carpeting was used as a substitute for, or in combination with, imported Oriental carpets. Nevertheless, these floorcoverings were still sufficiently expensive to warrant the use of protective covers in the form of small rugs or druggets made of plain, coarse woollen cloth that were placed over areas where wear was most likely to occur. Dining rooms and breakfast rooms were particularly susceptible to spills and stains, and druggets, frequently coloured to match the other furnishings, were often placed under tables or sideboards. Protective covers were also placed around fireplaces to catch falls of soot and powdering cloths were used in bed and dressing rooms to save the carpet from hair or powder. By the mid 19th century druggets decorated with needlework borders sometimes served as a cheap substitute for more expensive carpets and were used on their own either on stairs or in rooms where there was no other floorcovering.

Manufactured rugs were made in a variety of shapes – square, rectangular, or round – and loose-fitting rugs had the advantage of being able to be turned and reversed to equalize wear. Fitted carpets, made in strips cut to accommodate the shape of the room and tacked to the floor, were fashionable by the second half of the 18th century, and in 1806 Thomas Sheraton observed that “since the introduction of carpets, fitted all over the floor of a room, the nicety of flooring anciently practiced in the best houses, is now laid aside”. The architect Robert Adam designed some particularly fine examples with boldly-coloured patterns whose design complemented that of the decorations and architectural features within interiors such as Syon House, Middlesex (1768–69). Mid-19th century design reformers such as Charles Eastlake criticised the taste for fitted carpets as both unhygienic and dishonest and advocated a return to scatter rugs that did not mask the construction of the floor and that could be removed and beaten for more effective cleaning. Hall runners were generally loose, while stair runners were either tacked to treads and risers or threaded under rods fastened at the foot of each riser. Cheap druggets and mats were placed at outside doorways for wiping boots and shoes before entering the house.

Machine-made carpets have proliferated in the 20th

century, with advances in manufacturing processes causing reductions in price. The wall-to-wall carpet, which is cut to fit the room and tacked permanently to the floor, has changed from a symbol of luxury and prestige to a commonplace item in homes and public buildings. In the early 1950s the invention of high-speed tufting machines and the introduction of rayon, nylon, polypropylenes, and polyesters as carpet material caused a revolution in the carpet industry. By the 1980s carpets were of superior quality to those of the early 1950s and cost only about half as much.

Large tufting machines make carpeting with hundreds of individual needles stitching simultaneously through a backing material, and may be as much as 15 feet wide. A secondary backing material is added to hold the tufts in place. Foam rubber, sponge, or vinyl cushion may also be added. Carpet can be made plain or patterned in a number of different pile treatments. The pistol tufter, a tool that shoots wool through a canvas web backing, was introduced in the 1980s, and is used to make intricate designs similar to tapestry.

Other machine-made carpets include knitted and needlepunch rugs. Knitted rugs are worked on three sets of needles, and have a foam backing added after the knitting is done. These rugs are usually solid color or tweed. Needlepoint carpet is a flat, utilitarian indoor / outdoor carpet formed of unspun fibers meshed into a pre-woven fabric by the action of hundreds of barbed needles. It is made of weather-resistant polypropylene and can be printed with colorful designs. Indoor / outdoor carpet lacks the aesthetic appeal of soft pile carpeting, but it has provided a means of covering bare floors in areas where pile carpeting would not be practical or affordable.

Floors

The earliest floors were of tamped earth, and in many contexts rudimentary earth floors have continued in use into the 20th century. Spanish colonials in Mexico and the American southwest sealed earth floors with blood, but oil or whitewash offered less grisly alternatives. Plasters of lime or mud, dung and straw, often decoratively painted or incised, were a common medieval treatment for earth floors, and survive in folk houses around the world. Nomadic peoples used matting or rugs for temporary floors, a custom that has died hard in the floor-oriented cultures of Africa and Asia where carpets, mats and cushions have traditionally been primary furnishings. Because of this, although glazed tile floors were used in Asia (especially Persia) from the 6th century BC, they were both rarer and less magnificent than surviving tiled walls. In 19th-century Japan, the secondary entrances of most farmhouses still opened on earth-floored rooms used for work, storage and food preparation. Shoes were removed before stepping up to the main floor, an austere wooden or bamboo platform or, in cold or damp regions, earth padded with layers of chaff and straw; either type would typically be covered with *tatami* matting.

Many of the elegant Hellenistic houses excavated in Delos reveal tamped earth floors (which were surely painted or

sealed) butted against beautifully painted walls. The upper floors of better Greek houses were wooden planks, but plasters of clay and rushes were also used over wooden joists. Bricks, terracotta tiles and stone slabs were used for lower levels throughout the ancient Mediterranean, but the Greeks also devised composition floors, recommended by Vitruvius as "very inexpensive and yet serviceable." Rubble, charcoal, and finally cement mortar were layered over compacted earth; smoothed and polished, the result was a glossy pavement which absorbed spills and retained warmth. Greek "black-stone" floors of lava cement colored with charcoal could be set with marble pieces in imitation of true mosaic. Similar polished concrete floors were favored by the Romans, who also laid rough terrazzo floors in service areas. Finely finished terrazzo (sometimes with lead strips separating fields of color) was used extensively in later Italian villas, and became fashionable in Victorian public buildings and residential entryways as wealthy travellers returned from their Italian tours. Today terrazzo is used primarily in public and commercial buildings.

Cobblestone is an ancient solution, durable and extremely cheap, and patterned cobblestone floors precede the development of mosaic flooring. By the 2nd century BC Greek mosaicists were using finely cut stone tesserae and small pieces of glass to create strongly colored, naturalistic designs. Mosaic was highly developed by the Romans and used throughout the empire; the floors of Imperial buildings and large villas often mirrored ceiling designs, and occasionally marked the placement of furniture. Epic battles and mythological scenes composed in fine mosaic were usually bordered with coarser tesserae, and reserved for the finest rooms. All-over geometric patterns and informal fields of tesserae were more common, and substantially less expensive. The influence of classical mosaic in medieval Europe and the Islamic world, however, was largely limited to religious buildings.

Marble was imported in great quantities for Roman public buildings during Augustus's reign, and laid in geometric patterns which echoed the interior's rhythms. By Nero's time shaped tiles cut from colored stone, *opus sectile*, created complex designs with little relationship to the architecture. Marble, stone, or brick was used for raised *hypocaust* floors, which were heated through under-floor passages. Although basic to Roman bath-houses after the 1st century BC, this innovation was not used in private homes until the Christian era, and rarely even then. Hypocaust floors were more common in Rome's chilly British outposts, but the Saxons abandoned them, preferring their smoky central fires. In northern China, the Ming aristocracy laid polished black flagstones over heating pipes; in Korea heated stone or ceramic tile floors were sometimes sealed with varnished paper.

Early medieval floors in Europe were generally earth, or brick laid on edge in a herringbone pattern. Flagstone or wooden blocks were preferred in the public rooms of wealthier homes, and upper floors were wood plank, usually oak. Marble floors, while rare until well after the Carolingian period, appeared regularly by the 14th century. The most common were checkered in black and white or "woven" patterns of thin monochrome strips, although finer floors, especially in churches, were laid with rich mosaic designs. Marble floors inlaid with resin compounds were developed during the 13th century, but as the resin lacked durability this

technique was short-lived. Thick layers of dry straw insulated the feet from cold brick or stone in winter; in hot weather, fresh greens were cooling. Wooden platforms could also provide areas of relief from hard, cold floors.

Stamped, unglazed red earthenware tiles were used for the floors of Charlemagne's palaces, and remained popular in Germany, Switzerland, Austria and the Netherlands until about 1700; grey and red tiles of this type were often laid in checkered patterns. Plain unglazed tile floors were more common, and could be polished to a shine. Lead-glazed tiles were introduced on the Continent in the mid 12th century through Islamic Spain, and simple square or hexagonal tiles were widely available by 1300. These were usually yellow, green, brown or black, plain or in sets with continuous patterns. Many Cistercian churches had floors of shaped tiles glazed in these colors, giving the effect of *opus sectile*. Heraldic, animal and geometric motifs were favored on "inlaid" earthenware tiles, the best examples of which were laid in French and English churches from the 13th and 14th centuries. Islamic craftsmen in Spain also produced white tin-glazed tiles with intensely colored designs, but these were only used for floors in the finest houses; Luca della Robbia's celebrated tin-glazed tile floor at Piero de Cosimo de Medici's palace sparked a brief vogue for similar pavements, particularly in Italy, France and the Netherlands. After the 16th century, most tin-glazed tiles were blue and white in imitation of Chinese porcelain, and the Netherlands became the major center for their production.

Glazed pavements fell out of fashion by about 1650. The Italian marble quarries were newly re-opened, and colored marble laid in antique patterns became the rage; inspired by the Italians, Louis XIV installed them at Versailles. Large slabs were used, and although most marble floors were still laid in simple alternating patterns, fantastic, richly colored *opus sectile* floors were installed in many Baroque palaces, particularly in France and Germany. Parquet and marquetry floors could be equally grand, if more fragile, and were better suited for upper rooms. The radiating central motifs and complex, curved borders of ballroom and great hall floors in the French royal palaces were influential throughout Europe, especially in Germany, but simpler, geometric parquet floors were more usual. By 1720 wood floors were in general use and marble, stone or tile paving were increasingly confined to halls and stair landings, a pattern which lasted into the 1920s. Matting – common on medieval floors – was banished to private chambers, and bare floorboards, waxed or scoured, prevailed until fitted carpets became available after 1750. Most early floors were hardwood, but fir and pine became usual – in progressively narrower boards – as the European forests were depleted. On occasions the boards were painted, a practice that was well-established in England by the 17th century and which was intended as a cheaper alternative to parquetry or marquetry. Few painted floors survive, but one of the finest examples in Britain can be seen in the Tyrconnel Room at Belton, Lincolnshire. Paint or parquet were also sometimes used to border a carpet, especially in England, a strategy which regained popularity in the late 19th century.

Inspired by archaeological discoveries, Neo-Classical designers renewed enthusiasm for marble floors in the halls and reception rooms of the rich. *Scagliola*, an imitation marble

made from cement and colored marble chips or pigment, also proved quite popular from the mid-18th century although this material was quite fragile and cracked easily underfoot. John Carr laid *scagliola* floors on the landing of the staircase in Fairfax House, York, in the 1750s while a more celebrated example survives in Robert Adam's anteroom at Syon House (1761) where the elaborate design of the *scagliola* floor echoes that of the ceiling and was derived from an illustration by Sebastiano Serlio.

Gleaming, pigmented *scagliola* or stucco floors, plain or patterned, were considered elegant throughout 18th-century Europe but, as the 19th century progressed, the price of fitted carpeting fell and this style of flooring gradually replaced earlier forms. Fitted carpets remained fashionable until the 1870s when writers like Charles Eastlake began advocating varnished hardwood and loose oriental carpets as a more artistic and "honest" treatment. Despite the trend towards hardwood, Scandinavians continued to prefer pine boards, smoothed and whitened with lime, well into the 20th century.

Before 1870, most American floors were also softwood: unfinished planks could be protected with a layer of sand, swept into decorative patterns for special occasions, but paint was tidier. The American architect A.J. Downing recommended staining every other board for a lively striped effect, if carpet was out of reach. Although Aesthetic tastemakers scorned manufactured carpet, parquet and hardwood planks were expensive, and softwood floors increasingly condemned as unhygienic. As an alternative, "wood-carpet" – thin hardwood "parquet" glued to a muslin backing – could be tacked down over an existing floor. Wood-carpet borders and medallions were also available, and as the price was comparable to carpet it was widely used to refurbish older homes. Washable surfaces like linoleum or oilcloth were often nailed over softwood floors in service areas, but were not recommended for public rooms.

Encouraged by A.W.N. Pugin, the English ceramics firm Minton & Co. first introduced its Gothic Revival "geometric" and "encaustic" tiles in 1842; in red, blue, fawn and dull yellow, these remained popular for halls and vestibules for over 50 years. Victorian factories produced tiles in dazzling variety, but plain unglazed red tiles were favored for floors, especially in Europe and America. After the 1870s, small square and hexagonal "mosaic" tiles were sold in sheet units with light classical motifs, borders, and even mottoes, and "sanitary" black and white tiles of this type became standard for conservatories and bathrooms. Although a wide array of industrially produced floor-coverings were available by the turn of the century, most designers continued to recommend dark polished hardwood scattered with rugs. By the 1930s paler wood finishes, cork tiles and composition floors were fashionable for modern interiors, and Frank Lloyd Wright's dramatic use of stone inspired many stylish Americans to install flagstone or slate floors. The American Colonial Revival also renewed interest in wide pine boards. But the informal lifestyles and inexpensive synthetics of the post-World War II era kept most floors buried under wall-to-wall carpeting, rubber, vinyl, or linoleum until the 1970s, when interest in natural hardwood flooring was rekindled.

Fontainebleau, School of

A milestone in the development of French decorative arts, painting and sculpture, the School of Fontainebleau (a label first coined in the 19th century) refers to an elegant and highly ornamental style of painting and interior decoration distinguished by the use of high relief stucco combined with painted panels. Developed primarily at the instigation of François I for the decoration of interiors at the Château of Fontainebleau near Paris, between 1528 and 1558, the Fontainebleau style can also be found at the Grotte de Meudon (1552), the Château d'Écouen (c.1540), in the tombs of chapels throughout the Ile-de-France and in a number of châteaux in the Loire valley.

The development of this distinctively French style, strongly influenced by Italian Mannerist painting, was to bring France into the Renaissance, moving away from the Gothic and forging a link between the restraint of Classicism and the excesses of Baroque. Fontainebleau became the medium

through which France assimilated ideas from Southern Europe and adapted them for her own use. Sculpture and painting complemented each other – the central motifs were painted, the cartouches in low relief and framing devices, such as strap-work (the imitation of interlacing leather straps) in high relief. With its sense of drama and exaggeration of style, Mannerism was well suited to the ornamentation of interiors. Contrived rather than natural, it broke with classical composition in its use of vivid colour, its distorted forms, incorporating scenes from mythology, garlands of flowers, baskets of fruit, Mediterranean draperies and sensuous nudes.

For around one hundred years Fontainebleau was an important centre for the decorative arts, employing Italian painters together with some of the finest French and Flemish artists and craftsmen of their time – stucco workers, woodcarvers, gilders, stone masons, tapestry weavers, bronze casters and printers – and providing a training ground for French sculptors, decorators and painters. Distinguished visitors included the sculptor and goldsmith Benvenuto Cellini, who made a magnificent gold salt cellar for François I.

Until the release in 1528 of François I from captivity in Madrid, Fontainebleau had been little more than a hunting lodge of the Capetian kings. Favouring it in preference to the Loire, he ordered it to be redesigned, under the direction of master mason Gilles Le Breton. The addition of apartments and galleries occurred somewhat haphazardly over a period of time, starting with the Cour Ovale and the Cour du Cheval Blanc, linked by a wing which incorporated the fine Galerie François I. Behind a simple façade the interiors were to be elaborately designed. In 1530, inspired by the Italian humanist princes and the desire for prestige, François I invited the Florentine master artist Giovanni Battista Rosso (1494–1540), known as Rosso Fiorentino, to decorate the new rooms. Rosso, who had worked under the Florentine painter Andrea del Sarto, moved to Rome in 1524 (where he acquired Mannerist leanings and use of ornament), to Venice after the Sack of Rome in 1527 and thence to Fontainebleau.

Francesco Primaticcio (1504–70), a pupil in Mantua of Giulio Romano (whose contributions to Fontainebleau included tapestry designs which were woven in Brussels), gained his decorating skills working with Romano on the Palazzo del Te. Influenced by Parmigianino, he introduced a more restrained style of Mannerism than that of Rosso. Summoned by François I in 1532, he took over as Director of Works to the King on Rosso's death in 1540 and also contributed designs for enamels, sculpture and architecture.

Nicolò dell'Abate (c.1512–71) trained in Bologna under Correggio and Parmigianino, where his designs for palace interiors combined stucco with deep-focus landscapes and friezes of figures in the foreground. He arrived at Fontainebleau in 1552 to assist Primaticcio, bringing his own vibrant use of colour, fantasy, sensuality and illusion and a particular talent for painting frescoes. Although little remains of his decorative work, he contributed much to the ensuing French painting and landscape tradition.

The 64-metre Galerie François I, started in 1534, was Rosso's greatest achievement at Fontainebleau. After his death in 1540 the lively decoration, strongly influenced by Raphael, was completed by Primaticcio. The walnut panelling, with carvings by Francisco Scibec de Carpi, was replaced during the

19th century and the stucco and fresco decoration restored in the 1960s and 1970s. The window bays were interspersed with antique casts, brought to France by Primaticcio who visited Rome in 1540 and returned with antiques and plaster casts of classical statues in the Belvedere Court of the Vatican to be cast in bronze. These, and others resulting from a visit to Rome in 1552 and placed in the Jardin de la Reine and the Cour de la Fontaine, prompted Giorgio Vasari to describe Fontainebleau as "a new Rome". Rosso and Primaticcio collaborated on the decoration above the wainscot. Mannerist in style, it included dramatic stucco figures of men and women, satyrs, angels, putti, masks and garlands of fruit, surrounding frescoes of mythological scenes executed predominantly in green and mauve with yellow, grey-blue and pink. Frescoes showed scenes in the life of François I, including L'Eléphant Royal, an allegorical reference to the wisdom of royalty, decorated with *fleurs de lys*, the letter "F" and ostrich feathers, the symbol of justice. There is an innovative use of strapwork and the ceiling is panelled and highlighted in gilt. The galerie was badly restored during the reign of Louis Philippe, and Rosso's work is chiefly known through many superb drawings.

The adjoining Appartement des Bains was an innovation in France, inspired by Ancient Roman baths with their stuccos, cartouches and grotesques, was influenced by Rosso and directed by Primaticcio.

Running along the southern wing of the Cour du Cheval Blanc, destroyed in 1738, the Galerie d'Ulysse was completed in 1570 after Primaticcio's death. In place of Rosso's strapwork Primaticcio favoured the use of small-detailed grotesque ornament, possibly influenced by the Vatican Loggie and the Volta d'Orata of the Golden House of Nero. The ceiling was decorated with small panels of figures, elegant, elongated women. Drawings show how Mannerist tricks were played with space and perspective.

The superb Galerie Henri II, also known as the Salle de Bal, survives in its restored form. It was decorated by Primaticcio assisted by Nicolò dell'Abate. The space between the ceiling and the ten windows was decorated with frescoes which show eight mythological groups which are echoed in the recesses.

Under the patronage of Henry IV who revived the decorative painting of palaces, and Marie de Medici, a Second School of Fontainebleau evolved in the late 16th century, though it lacked the brilliance and innovation of the First. Chief protagonists were the Flemish artist Ambroise Dubois (1542–1614); Toussaint Debreuil (1561–1602) and Martin Fréminet (1567–1619). Subject matter included images from the *commedia dell'arte* and women at their toilette, while colours were more subtle, with more tonal contrast.

Subsequent rulers, notably Marie-Antoinette and Napoleon, who described Fontainebleau as "the house of the centuries", ordered many restorations and changes and little remains today. It is in the field of interior design and the training and inspiration of skilled craftsmen that the School of Fontainebleau left its mark. Although much of the decoration has been overpainted, badly restored or simply destroyed, the decorative tenets of Fontainebleau spread through Northern Europe. Demand for highly decorated interiors was created through drawings and technically superb prints and the designs

and innovations, notably Rosso's strapwork, were taken up by woodcarvers, enamellers, tapestry weavers, even armourers.

JACQUELINE GRIFFIN

The school of Fontainebleau was established under the direction of the Italian painter, Rosso Fiorentino (c.1494–1540), invited to France by François I, c.1531. Rosso was succeeded by another Italian, the Bolognese artist Francesco Primaticcio (1504–70), c. 1532, who had trained under Giulio Romano at the Palazzo del Te in Mantua. In 1552 Nicolò dell'Abate (c.1509–71) arrived at Fontainebleau, where he remained until his death in 1571. Together with a large workshop, they created a series of galleries and apartments, decorated with painted and stuccoed ornament executed in an attenuated and elegant Mannerist style. Combining strapwork and grotesques in its formal vocabulary, this established the predominant style of the Fontainebleau school. Primaticcio was also active for Catherine de' Medici on memorial and religious sculpture, 1560–70.

Selected Works and Drawings

At Fontainebleau:

- 1533–39 Chambre du Roi (Primaticcio: decoration)
- 1534–37 Galerie François I (Rosso: fresco and stucco decoration)

France

Although French interior decoration assumed a widespread influence outside France in the 17th and 18th centuries, it only really began to take a place in the main European artistic tradition during the reign of François I in the 16th century. Prior to this period, Late Gothic rooms were often richly furnished and decorated – as may be seen in contemporary book illustrations – and the most important fixed element was the fireplace, usually with projecting corbels which supported a hood. Viollet-le-Duc described several examples in his *Dictionnaire* (1858–68), singling out especially those in the mid-15th-century house of Jacques Coeur in Bourges, with their elaborately sculpted decoration, and the enormous triple fireplace featuring richly carved capitals and representations of angels supporting shields, which was installed in the Palais des Contes, Poitiers, in the 14th century for Jean, duc de Berry. The importance of the fireplace in a room was to remain a characteristic of French decoration until the 19th century.

Stone vaulting was used in such 14th-century royal buildings as the Château de Vincennes and the Conciergerie in Paris, but there is a rare domestic example of a decorative use over the 15th-century staircase in the Hôtel de Bourgogne in Paris, in which the four ribs are in the form of leafy oak branches spreading over the surface of the masonry. In general the timber construction of the floors or roofs above the rooms was left exposed and decorated, sometimes with carvings, sometimes with panelling, and often with painted patterns. This feature remained typical, even after underdrawn ceilings were introduced; two fine late examples are the 16th-century Salle des Gardes in the Château de Fontainebleau and the early 17th-century Grande Salle of the Hôtel de Sully in Paris.

Floors were generally paved with tiles laid in geometric patterns, as in ecclesiastical buildings, but these have rarely survived. The bare walls were usually plastered and covered with tapestries or painted hangings which could be packed and transported from place to place since the life of the Court and nobility was peripatetic. It was customary to change them four times a year, according to the season, together with the oriental carpets and the cushions. Tapestries were also draped over tables and beds. Tournai and Arras were the centres of manufacture, especially in the 15th century, and the latter town gave its name outside France to wallhangings in general;

Shakespeare had both Polonius and Falstaff hiding behind an arras. The museum in the late 15th-century Hôtel de Cluny, Paris, contains notable examples of tapestries, including the famous *milles-fleurs*, so-called because the backgrounds are filled with scattered flowers surrounding the groups of courtiers and animals.

Other forms of mural decoration were also used. The Chambre du Roi in the Château de Vincennes was described in the middle of the 15th century as being worked with gold and faced with wooden panelling, while the vaulting of the Grande Salle was panelled with chestnut which acted as insulation. The Chambre Verte in the Palais de la Cité in Paris was panelled with Irish oak which was believed to repel spiders and thus prevent cobwebs. Some rooms at Vincennes are thought to have retained the original painting from the late 14th century, and undoubtedly painted decoration was often used. Viollet-le-Duc wrote extensively about the various techniques and patterns that were used in the 13th to 15th centuries, and he made use of this knowledge in his restoration work at the Château de Pierrefonds as well as in ecclesiastical buildings. The 14th-century frescoed walls in the Palais des Papes at Avignon are covered with a sumptuous combination of painted draperies for a dado, quatrefoil frames separated by little aedicules as a frieze, and between them an overall pattern of giant vine scrolls. This scheme was possibly painted by Italian craftsmen, and it is with the importation of two outstanding Italian artists, Giovanni Battista Rosso (known as Rosso Fiorentino 1495–1540) and Francesco Primaticcio (1504/5–70) by François I in the 1530s that French decoration moved into a new and important phase.

In 1528 Gilles Le Breton was commissioned to rebuild the Château de Fontainebleau and to create a new gallery as a link with the old convent. Two years later Rosso was summoned from Florence to undertake the decoration of the new rooms, and in 1532 Primaticcio, who had worked with Giulio Romano at Palazzo del Te, Mantua, joined him. In François I's earlier châteaux at Blois (1515) and Chambord (1519) elaborate façades concealed interiors that had been furnished in the traditional manner with ornate fireplaces and tapestries. At Fontainebleau, however, this model was reversed. The exterior was relatively plain while the interiors were elaborately and permanently decorated. The Galerie François I is the least altered of the apartments for which Rosso and Primaticcio were responsible, although it too has suffered some changes and restorations. The lower parts of the walls of this 64-metres-long gallery are panelled in walnut with carvings by Francisco Scibec de Carpi (replicated in the 19th century); above is a riot of Mannerist-inspired decoration, of stucco figures of Parmigianino-like men and women, of putti, satyrs and angels, disconcertingly varied in scale, of garlands of fruit and of masks, and of large mythological scenes in fresco. Into all this Rosso and Primaticcio seem to have introduced the strapwork ornament that was to become popular in Northern Europe and which even survived in an elegant form of bandwork in 18th-century decoration. Restoration during the 1960s revealed that the original colouring of the frescoes was predominantly green and mauve, with smaller areas of salmon pink, pale yellow and slate blue. The ceiling of this remarkable room is compartmented, geometrically panelled and highlighted with gilt.

France: Palais des Papes, Avignon, 1334-62

Primaticcio also decorated the King's Bedroom, which the English ambassador to France described to Henry VIII (who was eager to have all the details of François's palace building and decoration) as "very singular as well with antical borders as costly ceilings and a chimney right well made", as well as the Queen's Bedroom, both of which have lost their decoration. The room of the Duchesse d'Etampes and the staircase to the Royal Apartments retain most of the original work which is in the same Mannerist style as the Galerie with huge attenuated nude figures flanking frescoed panels of mythological subjects. Sebastiano Serlio (1475–1554) was another importation from Italy. He arrived at Fontainebleau in 1541 where he designed an open loggia, now known as the Galerie Henri II or Salle de Bal; this was completed to a revised design made by Philibert de l'Orme (1514–70) who became Superintendent of Buildings in 1547. He changed the ceiling from a vaulted one to the present flat wooden one divided into square and octagonal coffers. This was executed in 1550 by Scibec de Carpi. Primaticcio, this time working with Nicolò dell'Abate (c.1512–71), was responsible for the decoration of this gallery, but all these rooms, including the Galerie d'Ulysse which was destroyed in 1738, were executed by artists – French, Italian and Belgian – who became proficient in this Italo-French Mannerist style and formed what became known as the First School of Fontainebleau, an enterprise that played a major part in establishing the Renaissance in France.

Towards the end of his life François I resolved to rebuild the Louvre, and Pierre Lescot (1500/10–78) was commissioned to make the design in preference to Serlio. After François's death in 1547 Henri II confirmed the appointment and Jean Goujon, the leading sculptor of the time, worked with Lescot on the interiors. These included the Salle des Cariatides, in which the four figures based on those on the Erechtheum and forming a porch facing the throne, are still in place. The ceilings of the main rooms, especially of the Grande Antichambre or Salle Henri II, were elaborately carved by Scibec de Carpi and heavily gilded in a manner that foreshadows the opulent interiors of the 17th century. Thomas Coryate, writing in 1611, thought "a stranger upon the first view thereof, would imagine it were beaten gold".

The work of the painters of the Second School of Fontainebleau, who worked for Henri IV, has largely disappeared; but from engravings and a few survivals it appears that the three artists (Ambroise Dubois 1542/3–1614, Toussaint Debreuil 1561–1602, and Martin Fréminet, 1567–1619) were still working in a Mannerist style well into the 17th century. According to Anthony Blunt, at this time private patrons continued to indulge in the "fantasies of Late Mannerism, not, it is true, quite as wild as those of the previous decades, but still ignoring the logical style encouraged by the King" (Blunt, 1970). The Mannerist character is clear enough in the designs for fireplaces, furniture and grotesque decoration made and published by Jacques Androuet DuCerceau the Elder (c.1515–c.1585) after he had visited Rome in the 1540s. How many of his fantastic designs, overloaded with ornament, were executed is unclear, but his publications helped make Italianate design fashionable in France. This influence may be seen, for example, in the Burgundian furniture associated with the name of Hugues Sambin (c.1520–c.1601/2), who also published a book of extraordinary term figures. Two of DuCerceau's

grandsons, Salomon de Brosse (1571–1626) and Jean Androuet DuCerceau (c.1585–c.1650), were the architects for the Palais du Luxembourg for Marie de Médici, the Queen-Regent, which was begun c.1614.

Hardly anything remains of the original decoration in the Palais de Luxembourg, but there are survivals, such as the panels painted by Theodore van Thulden. The most important decorations, the Rubens series of 21 allegorical paintings based on the life of Marie de Médici, once in one of the galleries of the Luxembourg, have long since been removed to the Louvre. Salomon de Brosse was responsible for work in several châteaux and Parisian hôtels, but his most important interior was the Salle des Pas Perdus in the Palais du Parlement, Paris (now Palais de Justice), which was constructed between 1618 and 1624. This austere stone hall (reconstructed after destruction during the Commune in 1871), with its giant Doric columns and black and white chequered floor, was de Brosse's attempt to recreate the grandeur of the basilicas of Ancient Rome, and it introduced a new seriousness into French Classical public and ecclesiastical architecture and decoration, which was apparent too in the work of François Mansart (1598–1666). The only one of Mansart's buildings in which the decoration has survived is the Château de Maisons (1642), but this shows an austere Classicism which does not rely on gilding or colour for its effect. There is a noble Antique air about the Roman Doric vestibule and the monumental staircase beyond that is almost a reproach to the excessive ornamentation of more or less contemporary and later interiors. Nevertheless, Mansart could also charm, as in the small Cabinet aux Miroirs with its pretty painted and inlaid decoration, its domed ceiling with stucco grotesques and painted putti, and its patterned marquetry floor in which pewter and bone were also used. This is the earliest surviving example of a mirror room.

Along with the adoption of the visual characteristics of Italian Renaissance architecture, there was a growing appreciation and application of its order, regularity, harmony and proportion. The Marquise de Rambouillet's pioneering of these qualities in the remodelling from 1619 of her Parisian hôtel has been discussed by several authors (notably Thornton 1978), and evidently her innovations were observed, admired and imitated, even by Marie de Médici at the Luxembourg. The Marquise's Chambre Bleue, in which the wall coverings, paintwork and furnishing fabrics were all of shades of the ubiquitous colour, seems to have been regarded as revolutionary in its harmony and uniformity. We are assured by an early 18th century writer that her decorations and arrangement of rooms were imitated in "all well ordered and splendid houses".

The most splendid Parisian hôtel of the 1640s was the Palais Mazarin. Some of the decoration still showed Mannerist influences but the finest room, the Galerie Mazarine (which survives in the Bibliothèque Nationale), was the work of the Roman painter, Giovanni Francesco Romanelli, who created in 1646–47 what has been described as "a type of decoration blending in a novel manner classical and Baroque elements ... Romanelli may be said to have combined the classical pattern of the Farnese ceiling with the rich stucco effects achieved by Pietro da Cortona in the Palazzo Pitti" (Blunt, 1970), a combination more palatable to a French public. The Cardinal's library was moved after his death to a wing of the Palais de

France: Galerie François I, Fontainebleau, 1534–37

l'Institut, built in the 1660s as the Collège des Quatre Nations by Louis Le Vau (1612–70), who had earlier shown his skill as a designer and decorator in the Hôtel Lambert (1639–44). The Cabinet de l'Amour, Cabinet des Muses and, above all, the innovative Galerie revealed a control and harmony between the clearly defined decorative elements, the bronze and gold stucco reliefs of the Labours of Hercules, the painted landscapes by Jacques Rousseau and the ceiling painted by the Rome-trained Charles Le Brun (1619–90) which was “the most ambitious piece of Baroque illusionism to be executed in France”.

Le Vau was also the designer of the Hôtel de Lauzun (1656) which has richly modelled and gilded decoration and ceilings attributed to Le Brun, all in the most luxurious taste. Opulence from floor to ceiling could hardly go further than in these rooms in which no surface is left unadorned. Other Parisian hôtels of the mid-century, such as the Hôtel des Ambassadeurs de Hollande (Pierre Cottard 1657–60, now the seat of the Fondation Paul Louis Weiller) which retains a gilded gallery with stucco putti and a *trompe-l'oeil* ceiling painted by Michel Corneille, and the Hôtel Beauvais (Antoine Le Pautre, 1654–60, now the headquarters of the Association pour la Sauvegarde de Paris), of which the staircase was decorated by the Flemish sculptor Van der Bogaërt (known as Martin Desjardins), show the influence of the Cardinal's Baroque taste in the Palais Mazarin.

Le Vau was appointed Premier Architecte du Roi in 1654, and he began work at the Louvre, collaborating with Romanelli and the stuccoist, Michel Anguier; but then in the following year he received the important commission for the Château de Vaux-le-Vicomte for the government financier Nicolas Fouquet. The centrepiece of the plan is a great oval drawing-room, two storeys high, which Le Brun and his collaborators decorated in a manner close to Pietro da Cortona's combination of painting, stucco and gilt in the Palazzo Pitti. But it was nonetheless “a totally French achievement, conjured up by a French architect-decorator and carried out entirely by Frenchmen” (Thornton, 1978). The story of Fouquet's downfall as a consequence of daring in his château to emulate the grandeur and luxury of the royal household is well known, and the young Louis XIV not only confiscated Vaux but also took over Fouquet's artists. Le Brun became Premier Peintre du Roi, and in 1663 he was made responsible for decorating parts of the Louvre, including the rebuilt Galerie des Rois (renamed the Galerie d'Apollon) after a disastrous fire. This was a development of his work at Vaux, and in 1665 Christopher Wren wrote admiringly about the current work in the Louvre where he could watch artists and craftsmen engaged “in Carving, Inlaying of Marbles, Plaistering, Painting, Gilding &c. Which altogether make a School of Architecture, the best probably, at this Day in Europe”.

Although work continued at the Louvre until 1680, Louis XIV concentrated on the Château de Versailles, turning it from a hunting lodge into Europe's greatest palace and an influential if not quite emulable model in other European countries. The history of its transformation and the many artists involved has been written many times and the complexities of its decorations can only be summarised here. Le Brun's first work at Versailles was in the Grands Appartements, in which the ceilings were a similar combination of stucco, paint and gilt to

that of the Galerie d'Apollon. The walls were covered either with patterned velvet or coloured marbles, and the floors too were patterned with marble. Le Vau's *Escalier des Ambassadeurs*, which formed the approach to these rooms (each of which contributed in its painted allegorical decoration to the theme of Apollo or the Sun King) was panelled with marble and painted with *trompe-l'oeil* architecture not unlike that in the Sala Regia in the Palazzo del Quirinale, Rome. The painted ceiling over the staircase contributed to the general theme. The whole was demolished in 1752 but the not dissimilar although less elaborate Escalier da la Reine (1670–81) has survived.

Le Vau died in 1670 and Jules Hardouin-Mansart (1646–1708) was appointed his successor. He and Le Brun were responsible for the Galerie des Glaces, of which the design was approved in 1678 and the work completed six years later. The bays of this 80-metres-long gallery are defined by 24 red marble pilasters with gilt bronze bases and capitals which, instead of one of the Classical orders, used an innovation, an *ordre français*, with symbolic fleurs-de-lis and suns. Above the richly coloured and mirrored walls is Le Brun's vaulted ceiling in which the paintings represent mythologised incidents in Louis's life, classicised so that he assumes the guise of a Roman emperor accompanied by all the gods and goddesses of Antiquity. This is the quintessence of decoration put to political service. At each end of the gallery a triumphal arch leads into the Salon de la Guerre and the Salon de la Paix. The rich effect of the marble and gilded stucco in these two rooms yields in each case to a dominating decorative element over the fireplace; in the former a huge oval sculptured panel of an equestrian Louis XIV by Antoine Coysevox (1640–1720), and in the latter a later painting by François Lemoine (1688–1737) of Louis XV bestowing peace on Europe. Anthony Blunt compares this famous suite of rooms to a Roman precedent, Palazzo Colonna, but concludes the Versailles ceiling is “less illusionistic, the compartments of the walls are more rectilinear, the carved trophies more classical. This is as far as the French could go towards Baroque at this period” (Blunt, 1970). It was, however, a considerable distance.

The furnishing of the royal palaces assumed a symbolic role as an expression of the magnificence of Louis XIV and France, and it became a part of the political strategies of Jean-Baptiste Colbert (1619–83) who had helped overthrow Fouquet and became Intendant des Finances in 1661 and Contrôleur General in 1665. The Gobelins workshops had been founded in 1622 by Henri IV to manufacture tapestries; this remained one of its principal functions, but in 1662 the enterprise was reorganised with Colbert as superintendant and Le Brun as artistic director, and it then became the Manufacture Royale des Meubles de la Couronne. One of Colbert's aims was to improve the standards of craftsmanship in France so as to reduce or put an end to imports from abroad; fashion, in clothes as well as in decoration and furnishing, was all promoted with this in view. The best designers and craftsmen were recruited by Le Brun, in order to create tapestries, carpets, brocades, mirrors, furniture of gold and silver, or inlaid with *pietre dure* to match the richness of the interior. Jean Le Pautre, who published engravings of designs for furniture in the 1660s, was an important figure, as was Jean Berain (1640–1711) who was Dessinateur du Roi from 1682 to 1711

France: Salon de Guerre, Versailles, 1678–84

and provided the designs for ornaments in Le Brun's Galerie d'Apollon in the Louvre. The most celebrated of the cabinet-makers was André-Charles Boulle (1642–1732) who was created Premier Ébéniste du Roi. He was skilled in working with metal and wood, but his name is inevitably linked with the elaborate marquetry of tortoiseshell, brass and ebony he used in opulent cabinets, commodes and bureaux which incorporated complicated grotesques and arabesques. Boulle too published some of his designs in *Nouveaux Deisjeins de meubles ...* (1707–30), one of the many publications showing ornaments and complete rooms which, as Christopher Wren observed, would “give our Country-men Examples of Ornament and Grotesks, in which the Italians themselves confess the French to excel”.

By this time the influence of French design was spreading well outside the country's boundaries. Travellers were noting and generally admiring the new ideas about decoration and the arrangement of rooms, the French Baroque style was becoming available to all through the increased number of publications such as the many illustrated by members of the Le Pautre family, and craftsmen were beginning to take their skills abroad. By 1634 it was said that in The Hague “The ladies and gentlemen are all Frenchified in French fashion”, and both architecture and decoration were following suit. The

Stadholder, Frederik Hendrik, Prince of Orange, had spent a year at the French court and returned full of admiration for what he had seen. The Mauritshuis in The Hague, the residence of Prince Johan Maurits van Nassau which dates from around 1633, had an obviously French quality both outside and inside, as had the Burgerzaal in Amsterdam's Town Hall, begun in 1648, with its cool classicism and allegorical sculptures.

Louis XIV's revocation of the Edict of Nantes meant that many Huguenots, including skilled craftsmen, left France for the Protestant Holland and England. Among them was Daniel Marot (c.1663–1752), a pupil of Berain. Marot went to Holland where he was commissioned to design the staircase and other apartments at Slot Zeist for the cousin of William of Orange and a former ambassador to France. He then entered the Stadholder's service and worked with Jacob Roman on the interiors of the palace of Het Loo in 1692, before travelling to England with William and his Stuart wife, Princess Mary, after their accession to the English throne. Marot continued to work in Berain's manner, but he added an increased elaboration in the hangings and upholstery of his furniture, especially of the great state beds with monumental testers in which he specialised; these are illustrated in his *Nouveau Livre d'Appartements* (1702). The Marot style became fashionable

in England as well as Holland, and he worked at Kensington Palace, Hampton Court and Ham House. One of Marot's innovations, the porcelain cabinet designed to display collections of blue and white ware on tiers of shelves, became a characteristic of Dutch interiors which was also adopted, with more moderation, in English rooms, especially over corner fireplaces.

Meanwhile at Versailles Louis XIV had begun a new project which, whatever the original intention, was to mark a change in interior decoration. This was the single-storey Grand Trianon, a small palace designed by Jules Hardouin-Mansart and built in 1687. Guy Walton writes that "as walls and windows rose at Trianon, the curtains to hang on them were being woven in Lyon, and at the royal manufactories old furniture was being restored and new made to fill the rooms" (Walton, 1986). From start to finish the building took seven months, and the interiors were quite different from those in Versailles itself. Walton comments that whether "it was because the finishing of the interiors ... coincided with a serious international crisis which called for the diversion of some funds ... or simply that Trianon was intended to contrast sharply with the heavy grandeur of the Apartments at Versailles, or even that the king wanted the fastest possible completion of work ..., Louis apparently said 'Paint everything white. No gilt or colour for the walls of Trianon'. The new white decor came at a time when the architectural articulation of the interior walls had reached a new level of refinement ... while a lightening of feeling was achieved by the increasing delicacy of purely decorative elements such as floral and architectural ornament". Whatever the explanation, the result seems to foreshadow the king's instruction to Mansart more than ten years later regarding the decoration of the duchesse de Bourgogne's apartments in the Ménagerie at Versailles to offer "a certain youthfulness, a certain playfulness, introduced into what we are doing".

The Grand Trianon apartments and others from the turn of the century were more private in character than the magnificent state apartments, and illustrate the first moves in the transition from Baroque to Rococo. The walls are lined with wood panelling, *boiseries*, which were generally painted white and gold. Mirrors were incorporated in the panelling, frequently replacing paintings over the fireplace, which remained the central feature in the arrangement of the room. The tendrils and scrolls of the formerly fashionable painted arabesques became less formal as they were translated into curling shapes which became part of the framing of panels and mirrors. Scrolls, masks and shells were introduced, although there was still a classical framework within the rooms even if the pilasters were panelled rather than being fluted or decorated with arabesques.

Louis XIV died in 1715. He was succeeded by his great-grandson, Louis XV, a minor, and from 1715 to 1723 the country was governed by the Regent, Philippe, Duc d'Orléans. During this period the political and artistic focus of the court moved from Versailles to Paris and a non-monumental form of decoration became fashionable. There was less formality, more comfort, and a new group of designers was emerging. Robert de Cotte (1656–1735) had become Premier Architecte in 1681, but because of financial crises the number of royal commissions had been declining during Louis XIV's last years, and de

Cotte and his colleagues were more often employed on private residences (*hôtels particuliers*), especially during the 1720s when Paris was expanding and noblemen were no longer required to be resident at Versailles. One of the most splendid of these early 18th century interiors was in the Hôtel de Toulouse, which had been built as the Hôtel de la Vrillière by Mansart (1633–34); de Cotte collaborated with François-Antoine Vassé (1681–1736) in redecorating the Galerie Dorée with a painted ceiling by François Perrier, mirrors, and enriched doorcases and chimneypieces. In the Palais Royal, Gilles-Marie Oppenord (1672–1742) redecorated Mansart's Galerie d'Enée, and in 1732 Jean-Baptiste Leroux (c.1677–1746) fitted out the gallery of the Hôtel de Villars with a profusion of Rococo filigree-framed mirrors, the elaboration of which was reflected in the design of the coved ceiling.

Oppenord created many interiors which earned him a reputation that was only increased by the posthumous publication of three volumes of his designs. More valuable are two publications which encapsulate early 18th century taste in decoration, architecture and garden design, Jacques-François Blondel's *Distribution des Maisons de Plaisance* (1737) and Charles-Etienne Briseux's *L'Art de bâtir des maisons de campagne* (1743). Appropriate decoration for each room in the house is prescribed, and this can be matched with rooms that have survived, either *in situ* or in collections at the Musée Carnavalet and the Musée des Arts Décoratifs.

A major figure in the first half of the 18th century was Germain Boffrand (1667–1754), who was apprenticed to Jules Hardouin-Mansart. Not only was he employed by several important clients to build or remodel their hôtels in Paris, but he was also a speculator involved in developing parts of the faubourgs Saint-Germain and Saint-Honoré and the Place Vendôme. It was he who, in his interiors, created a complete fusion of forms in which the structural lines became blurred and walls and ceiling merged into a unity of *boiseries*, mirrors, windows and doors. Boffrand developed this mastery from his early designs for salons in the Petit Luxembourg (1709–11) and La Malgrange (1712–17) near Nancy, where he worked for almost twenty years from 1702, to the perfection of the oval salon in the Hôtel de Soubise (1735–39) back in Paris, in which the decorative elements, the mirrors, putti, cartouches, are all fused into an undulating but carefully disciplined perpetual motion. Despite the freely flowing curves of this exquisite decoration in the rooms created for the Prince and Princesse de Soubise, the skeleton on which it was hung was still symmetrical although the classical elements themselves were no longer used. The fully developed Rococo did not begin until designs such as those of Juste-Aurèle Meissonnier (1695–1750) appeared when "through the hardening established lines of the French interior, about 1730, rustled a fresh breeze, bringing new life and movement. The novelty and import were recognised by contemporaries, who within a generation were to call it the *goût nouveau* or the *genre pittoresque* and to remark on its most striking characteristic, asymmetry — 'le contraste dans les ornemens'" (Kimball, 1980). Meissonnier's designs were published, some during his lifetime and others after his death, but he was more influential on Rococo decoration in Germany and Austria than in France where a more restrained version was preferred.

More to the taste of Parisian society was the work of

France: design for vestibule and salon by Jacques-François Blondel, from *De la distribution des maisons de plaisance*, 1737–38

Nicolas Pineau (1684–1754), who trained under Jules Hardouin-Mansart at the Gobelins and worked in Russia for Peter the Great for more than ten years. In the palace of Peterhof he “displayed great artistic tact and exquisite taste in decorating long panels with trophies of arms, globes, astronomical instruments, signs of the zodiac, musical attributes, palm fronds, flower garlands, scallop shells, foliate scrolls and other grotesque motifs”. After more than twenty years in St. Petersburg, Pineau returned to Paris in the late 1720s and collaborated with a number of architects on interiors of hôtels. One example that has survived is in the Hôtel des Maisons (c.1750), and another is in 26 rue Cambon. Both reveal a delicate line in the curving tendrils and interlacing natural forms of the elegant, restrained Rococo that recalls Blondel’s praise of “MM. Pineau, Lange and Verberckt [who] have contributed in rendering our dwellings worthy of the admiration of unprejudiced nations”. Certainly by this time French decoration was becoming European by adoption since it was widely admired, although examples such as the Drawing Room at Chesterfield House (1747–52) and the Music Room at Norfolk House (1753–56) were exceptional in England.

In the rooms of the Régence and the early years of Louis XV’s reign, the fireplace remained the main focus, as it had been since the Middle Ages. Usually it was made of marble and over it was placed an overmantel mirror which was often matched by others above marble-topped console tables. The flooring was patterned in marble or marquetry, or it was wooden blocks. The ceiling was generally flat and plain, with a chandelier hanging from a central ornamental rose. Michel Gallet has described the elaborate process of painting the *boiseries*, which entailed five operations. White and gold was the

most common combination, but fashions changed. In the 1730s pale yellow was favoured and described as jonquil, sulphur, straw or lemon; blue and lilac were popular complementary colours for the hangings. Another process was *verniss Martin*, a brightly painted and lacquered finish invented in 1730; it was usually a bright green. Illusionist decoration was sometimes found, especially in staircases, but it was relatively rare. An outstanding example is the painted staircase hall in the Palais Royal (1755–60) by Pierre Contant d’Ivry (1698–1777) who decorated several rooms for Philippe, Duc d’Orléans. In less magnificent interiors, paintings became a part of the overall wall design, generally being placed as an overdoor panel; pastoral scenes were popular.

In the 1730s the court once again became active as a patron, although Louis XV lacked his great-grandfather’s enthusiasm. A new generation of artists came to the fore. Ange-Jacques Gabriel (1698–1782) and Jacques Verberckt (1704–71) both worked at Versailles. First came the Petits Cabinets, dating from the late 1720s, in which the *boiseries* were delicately carved and some were finished with a *verniss Martin*. Soft colours were used, “*petit vert, jonquille, lilas et gris de perle*”, and there was no gilding except in the frames of mirrors and paintings. The Petits Appartements, a conception of Mme. de Pompadour which consisted of a private suite of a small salon, a library, a bedroom and a boudoir, were constructed in the 1750s and painted white and gold. Fontainebleau too received attention in the 1750s when the Cabinet du Conseil was redecorated with panelling painted with allegorical figures set inside Rococo frames and hung with floral garlands. François Boucher, Carle van Loo, Jean-Baptiste Pierre and Pierre-Joseph Peyrotte were the artists. There was similar decoration in the

Hermitage of Mme. de Pompadour at Fontainebleau, where Verberckt was in charge.

The Gobelins tapestry workshop had reopened in 1699 and it continued to provide fine pieces until competition from wallpapers and the general adoption of Neo-Classicism, with which tapestries did not easily fit, caused its decline. In 1775 François Boucher was appointed director, and his designs were used for the sets in the rooms that Robert Adam designed for them at Osterley Park, Newby Hall, Moor Park and Croome Court. The elegant, fanciful Rococo lent itself to the inclusion of exotic elements. A taste for Chinoiserie had produced the Trianon de Porcelaine, a ceramic-faced building designed by Le Vau at Versailles for Louis XIV and Mme. de Montespan (1670–71) and there are many references to furnishings *à la chinoise* in 17th-century inventories.

Berain's designs for grotesques occasionally included oriental motifs. In 1719 Antoine Watteau painted a series of oriental figures for the Château de la Muette, and Christophe Huet added monkeys to Chinamen in the *Grande Singerie* he painted in 1735 for the Château de Chantilly. Around the same time Andien de Clermont was introducing simian figures in his decorations in English houses, at Kirtlington Park and Wilton House. There are more monkeys in the Hôtel de Rohan's Cabinet des Singes (c.1750) by Huet, who decorated the Salon Chinois at the Château de Champs for Mme. de Pompadour, whose protégé, François Boucher, designed a series of tapestries, *Tentures chinoises*, which were woven at Beauvais. Chinoiserie decoration continued to be popular in various media throughout Louis XV's reign, and Jean-Baptiste Réveillon, the leading producer of wallpapers, was using Chinese subjects as well as Pompeian up to the time of the Revolution.

By the 1750s a change in taste had occurred, first in architecture and then in decoration, and a reaction against the Rococo was asserting itself. The newly awakened interest in Antiquity was reinforced by the influence of Mme. de Pompadour and her brother, the Marquis de Marigny, who was appointed Directeur des Bâtiments in 1746. After two years in Italy he returned in 1751, an opponent of Baroque and Rococo architecture and decoration and a convert to the Antique. Francis Watson has drawn attention to the well-known portrait of Mme. de Pompadour by François-Hubert Drouais, in which "the transitional style is admirably exemplified in almost every piece of furniture with which she is surrounded. The cabriolet form of the stool, the undulating lines of the sofa and the curved and splayed legs of the gueridon table beside her, all still hark back to the Louis XV style, but the prominent goats' heads and heavy swags with which the table is mounted and the strictly rectilinear shape of the work-box with its handle in the form of a Roman victor's wreath are in the new Neo-Classic taste" (Watson, 1956).

Young French artists at the Académie de France in Rome were inspired by the discoveries at Herculaneum and Pompeii, and they were encouraged by Marigny's instructions that they should be given studies "*pour corriger le mauvais goût d'ornement qui subsiste aujourd'hui*". But it was some time before the Rococo lost its curl and wilted – or straightened up. Verberckt was faithful to it until the end, and Gabriel was still designing *boiseries* and trophies for Madame Adélaïde's Salon de Musique in 1767. However, the Petit Trianon at Versailles,

intended for Mme. de Pompadour by Louis XV, but completed only in 1768 after her death, marked a change. Curves on plan, in section and in decoration had disappeared. Straight lines were the rule, and acanthus scrolls had replaced Rococo tendrils; vases and medallions were incorporated in the wall panels, and white and grey predominated in the cool classical rooms. But at the same time as these changes were taking place, there was a partial return in the decoration of some Parisian hôtels, and more particularly in public buildings such as the Ministère de la Marine (Gabriel 1762–72) and the Monnaie (Jacques-Denis Antoine 1768–75) to the pre-Rococo style of Louis XIV's reign. The two styles, both looking back but to widely separated periods, one to the 17th century and one to Republican Rome, existed side by side during the 1760s.

The popularity of the newly discovered interest in the Antique as a design source can be measured by the success of the publication in 1768 of Jean-Charles Delafosse's *Nouvelle Iconologie Historique*, a collection of engravings of classical ornament which had to be reprinted within three years. A casino designed by François-Joseph Bélanger (1744–1818) for the Marquis de Lauragais in 1769 abandoned all the elements of Rococo decoration and introduced a wall articulation of Ionic pilasters. *Scagliola* was used in the Doric pilastered dining room of the Hôtel de Botterel-Quintin (attrib. Pérard de Montreuil c.1780). Although the salon in the Hôtel d'Uzès (1768) by Claude-Nicolas Ledoux (1736–1806), now in the Musée Carnavalet, might seem still to be recalling something of the splendour of Louis XIV, there is a monumental Roman quality with Palladian undertones in his other work; in Mme. du Barry's pavillon at Louveciennes (1771), the dining room has apsidal ends, a partly coffered ceiling, and walls lined with giant order grey marble pilasters with gilded Corinthian capitals. Ledoux incorporated rotundas, coffered domes, muses and vases in the geometrically planned Hôtel Hocquart (1765) and Hôtel de Montmorency (1769), and even the 73-year-old Gabriel followed the fashion when, in 1771–72, he made a design for a Cabinet du Conseil at Versailles in which the only decorations were Corinthian pilasters. The *palais abbatial* at Royaumont (1785–89) by Louis le Masson (1743–1830) derives from Palladio's Villa Capra in plan, but its interiors, especially the Galerie Dorique, display an austere nobility with stone walls and the eponymous columns.

The credit for the re-introduction of grotesque decoration is given to Charles-Louis Clérissieu (1721–1820), who had returned to Paris in 1768 from Rome, where he had assisted Robert Adam in recording vast quantities of classical ornament and decoration as well as becoming acquainted with the Raphaelesque decorations in the Vatican and the Farnesina. He had collaborated with Bélanger in decorating the Pavillon de Lauragais in the late 1760s, and his elegant arabesque / grotesques in the Hôtel Grimod de la Reynière c.1775 had immediately set a fashion. Possibly he was also consulted by Bélanger about the decoration of the Pavillon de Bagatelle (1777–78) for the Comte d'Artois; in the small rooms there are grotesques in stucco and on painted panels, and Jean Dugourc, who executed the stuccowork, used a similar technique in the nearby Folie St. James (1778) where the entrance hall is painted with *trompe-l'oeil* architecture, statues and urns. Another outstanding interior of this date is the boudoir from the Hôtel de Sérilly (now in the Victoria and Albert Museum),

France: design by J.-C. Krafft for Madame Récamière's bedroom, 1798

which was decorated by Jean-Siméon Rousseau, using a Pompeian style with coloured and gilt composition ornaments; Clodion (1738–1814) supplied the handsome chimneypiece. To some extent this decoration reflects the influence on Bélanger and some of his contemporaries of the work of the Adam brothers in England, which was widely known through the 1773 publication of their designs, some of which Bélanger knew from first-hand experience.

After the arrival of Marie-Antoinette in 1774, Richard Mique (1728–94) and the brothers Rousseau had taken over from Gabriel and obeyed the Queen's taste for elegant floral decoration. According to the historian Wend Kalnein, "flowers swamped everything ... carving, paintings, hangings, clothes, and furniture. Festoons of flowers, still lifes of fruit and flowers, and cherubs playing with flowers". An enchanted flower garden was painted between a *trompe-l'oeil* Ionic colonnade in the Pavillon de Musique de Madame (Jean-François Chalgrin 1739–1811); but by 1780 when this was created, even the Court of Louis XVI and Marie-Antoinette had succumbed to the taste for Antiquity. Sphinxes, vases and medallions, as well as elegant arabesque / grotesques appeared at Versailles, as in the Cabinet Doré (1783), and at Fontainebleau, where the exquisite Cabinet de Toilette and Salon du Jeu were completed in 1785. In the former the delicate arabesques are painted on gold and silver grounds alternating with mirrors and the furniture was inlaid with mother-of-pearl; in the latter much of the decoration is grisaille, with richer colours on the doors and overdoors.

The chaos of the Revolution brought an era to an end, but once its worst effects were over there was a continuation of the fashions that had been evolving in the late Louis Seize years. The paintings of Jacques-Louis David presented a brave image of the classical past in which furnishings and draperies were based on Antique models but could also be taken as sources for contemporary apartments. The Neo-Classical taste and the cult of the Antique were only intensified, although there was an element of eclecticism in the borrowing from Greek, Roman and Egyptian sources. Many of the same architects, such as Bélanger, Louis-Martin Berthault (?1771–1823) and Alexandre-Théodore Brongniart (1739–1813) — the last was to design the major public building in Paris during the Empire, the Bourse with its majestic Roman interior — were still working and continuing an established 18th-century tradition.

New publications offered models for decoration, such as Charles Normand's *Nouveau Recueil en divers genres d'ornemens et autres objets propres à la décoration* (1803) and P.N. Beauvallet's *Fragmens d'architecture, sculpture, et peinture dans le style antique* (1804). But the most important and influential source of inspiration was the *Recueil de décorations intérieures* (1801 and 1812) by Charles Percier and Pierre-François-Leonard Fontaine, the architects favoured by Napoleon, since they could interpret his imperial ambitions in decoration and furnishing. From the very beginning of his rise to power, while he was still General Bonaparte, the future Emperor was commissioning designs for furniture which, despite its lavish ormolu mounts and bronze figures character-

istic of the first phase of Empire design, was nevertheless derived from late Louis Seize pieces. Again, the tented rooms in Bonaparte's first Paris residence in the rue Chantierine and, more famously, in the Château de Malmaison, were following the Comte d'Artois's 1777–78 example at Bagatelle where Bélanger had designed the bedroom with walls and ceiling draped in blue and white striped material edged with gold.

The remodelling and decoration of Malmaison represents the first phase of the Empire taste which combines a military theme with a generally restrained and elegant Neo-Classicism associated with the short-lived Directoire regime. Like all Napoleon's projects, the work had to be completed in a short time, which meant that draperies and paint were used to create an almost instant effect with simulated marbles, grisaille instead of elaborate plasterwork, and painted canvas rather than laboriously woven tapestries. At the same time Percier and Fontaine were restoring the Tuileries palace for use as an official residence. Where decoration had survived the treatment of the Revolutionaries, it was retained, and what remained of Marie-Antoinette's furnishings and decorations was reused. But Napoleon also resembled Louis XIV in encouraging the setting up of new factories to produce the furnishings needed to restore the splendour of the French court, helping the economy while contributing to the imperial image.

It was on Napoleon's instructions that silk weaving was revived at Lyon where Jean Dugourc (1749–c.1825), who had worked with his brother-in-law, Bélanger, at Bagatelle, made some of the finest designs, including a blue and silver brocade with a pattern of myrtle and ivy leaves which was used in 1802 in the Empress Josephine's Drawing Room. Records show that strong colours were popular; yellow and silver in her Music Room, and brown, blue and gold in the Emperor's grand cabinet. Spectacular panoramic wallpapers were being manufactured by Jean Zuber and Joseph Dufour, but wallpapers seem not to have satisfied Napoleon; he is said to have flown into a rage when he found some had been used at Fontainebleau which was being prepared for a Papal visit.

Before his downfall, Napoleon had decorated and furnished all his residences, the Tuileries and the Elysée Palace, Fontainebleau and Compiègne, Saint-Cloud and Rambouillet with furniture made by the Jacobs, including the famous beds created for the two Empresses, Joséphine and Marie-Louise, with Gobelins tapestries (although apparently his short reign allowed time only for one set to be completed), with carpets made in the Savonnerie factory or at Aubusson, and with Thomire bronzes and Sèvres porcelain. Most of these furnishings were classical in inspiration with ornaments derived from Antiquity, although there was a short-lived Egyptian fashion. But the Napoleonic image was spread to other European countries where members of the Bonaparte family were placed temporarily on usurped thrones; hence its influence in Holland, Spain and Italy.

Despite the constant wars between England and France in the 18th and early 19th centuries, there was considerable reciprocal influence between the two countries on their styles of decoration and furniture. Sir William Chambers and Robert Adam, François-Joseph Bélanger and Charles-Louis Clérisseau alone formed a quartet in which there was a general exchange of ideas, while Henry Holland clearly had an affinity

with French Neo-Classicism. Thomas Chippendale's *The Gentleman and Cabinet-Maker's Directory* (1754) contains designs strongly influenced by French Rococo furniture, and Adam interiors were frequently furnished with *bergère* chairs and *bombée* commodes either bought in Paris or based on French pieces. Before the Revolution the Prince of Wales (later George IV) was buying furniture through Guillaume Gaubert (who had been employed as a decorator at Chatsworth) and Dominique Daguerre, a prominent Parisian *marchand-mercier*, and French artists were employed at Carlton House – Jean-Jacques Boileau, Jirouard Le Girardy, Louis-André Delabrière (to whom the delicate Bagatelle-like painted arabesques at Attingham Park have been attributed) and Alexandre-Jacques de Chantepre. The Prince was a great collector of French furniture, favouring that of Louis XVI date, but he also took a keen interest in the latest Parisian fashions, and there are many similarities between Regency and Empire furniture designs. Anglo-French reciprocity is a complicated subject, but one aspect of it, apart from Carlton House, is the revival in England in the 1820s of French Rococo decoration which was generally referred to as “Louis Quatorze” although it was more accurately “tous les Louis”. Benjamin Dean Wyatt (1775–1852) at Apsley House, Belvoir Castle, Crockford's Club and York (now Lancaster) House, Sir Jeffry Wyattville (1766–1840) at Windsor Castle, and the little known Jonathan Ritson in the White and Gold Room at Petworth House, all incorporated skilful recreations of Rococo decoration, sometimes making use of old *boiseries*, but more often using composition, plaster and papier-mâché, a decade or more before there was a similar revival in Paris, but it came into its own again with the Second Empire.

The 1834 Exposition des Produits de l'Industrie Française in Paris raised a question that was being asked in other countries too, “Are we Greek, or Roman, or Gothic? are we returning to the Renaissance style or that of Louis XIV, or Louis XV, or the Empire? Have we one of our own?” The exhibits displayed in this and subsequent exhibitions reflected the eclecticism that characterised 19th-century taste all over Europe. A comfortable version of the Empire style persisted well into the 1830s. The Style Troubadour or *à la cathédrale* were two aspects of a taste for the Middle Ages which was displayed in Jacob Petit's *Recueil de décorations intérieures* (1831) which includes most of the styles then available; so did another publication, Théodore Pasquier's *Dessins d'ameublement* (1835) in which comfortable upholstered chairs and ones with spiky Gothic tracery backs exist side by side with heavily draped windows and hybrid fantasies of wall treatment.

The 1844 Exposition des Produits included a Salon Louis XV by Georges Monbro, and designs of the same date by Fernand Léger in the Musée des Arts Décoratifs illustrate a hierarchy of rooms in varying degrees of “tous les Louis” style. These range from an elaborate ballroom with herm figures supporting the ceiling beams and a marquetry floor, through a white and gold salon with heavily draped curtains, a dining room with Renaissance buffets, to astylar minor rooms. But a return to the 18th century was given an impetus after Napoleon III married Eugénie de Montijo in 1853. She made a cult of Marie-Antoinette and, as Mario Praz wrote, “became an interior decorator out of emulation of her idol and combined modern comfort with 18th-century elegance. She

France: wallpaper, c.1870

mixed sofas and chairs, over-stuffed with navel-like buttons, with authentic Louis XVI pieces and modern imitations of them made by cabinet-makers so clever that only the experts can distinguish these precise imitations from authentic 18th-century furniture". The result was known as Louis XVI-*Impératrice*, or the Second Empire style. The results of this mixing and matching could be seen at their best in the Château de Saint-Cloud and in the Tuileries. Both of these palaces were destroyed in 1871, the first by the Prussians and the other by the Parisians, but the apartments are recorded in detailed watercolours by Benedic Masson and J.-B. Fortune de Fournier. In the New Louvre, Hector Martin Lefuel (1810–80) created a suite of three apartments for the Empress which have survived to illustrate the Second Empire taste at its most opulent.

It was a taste that attracted followers of different classes. In a modified form, especially in the furniture, it was popular with the haute bourgeoisie who appreciated its combination of comfort and history, and revivalist features were relatively easy to manufacture in plaster and paint. Wealthy families, such as the Rothschilds, might not yet have built up their substantial collections of pre-Revolution royal furniture, but they could buy 18th-century *boiseries*, bronzes and furniture, or items from any other historical period, to install in their great mansions and town houses. Of these, Ferrières in France (1853–59), Mentmore (1850–55), and Waddesdon Manor

(1876–90) in England are the best known. The first two were designed by Sir Joseph Paxton (1801–65), and the last, which is largely furnished with decorations and furnishings brought from France, was actually designed by a Frenchman, Hippolyte-Alexandre-Gabriel Destailleur (1822–93). At Ferrières, Eugène Lami, who made watercolours of the rooms, was in charge of the decoration which ranges stylistically from Louis XIII to Louis XVI.

The Emperor's decision in 1857 to restore the ruined castle of Pierrefonds brought Eugène-Emmanuele Viollet-le-Duc (1814–79) into the Imperial circle. Best known as the restorer of countless medieval churches and cathedrals, he was the greatest living authority on medieval decoration and furnishings. He found favour with the Empress who championed his design for the Paris Opéra. Nevertheless, this commission was given to Charles Garnier, whose opulent interiors epitomise the pleasure-loving society of the Second Empire, as do the interiors of Alfred Armand's adjacent Grand Hôtel de l'Opéra (1862). But as well as public buildings, such as Garnier's Opéra, and the Palais de Justice by Louis Duc (1802–79), Napoleon III's reign witnessed the transformation of the old fabric of the city by Georges-Eugène Haussmann (1809–91) and the erection of new building types including railway stations, the central markets at Les Halles and the *grands magasins*. In all of these buildings, iron and glass were used to create new structural forms which did not derive from historical precedents, even if the skins with which they were clad often derived some elements from the past. The vast internal spaces of such *magasins* as au Bon Marché (1873–76) by Louis-Charles Boileau (1812–76) and Gustave Eiffel (1832–1923) and du Printemps (1881–89) by Paul Sedille (who also designed the Rococo auditorium of the Théâtre du Palais Royal c.1880) illustrate a new spatial concept combined with stylistically eclectic decoration; the ironwork in the latter was brightly coloured, and bronze, marble and terra-cotta were all employed in the decoration. But the monumental Salle de Lecture in the Grands Magasins du Louvre (1881) reverted to the First School of Fontainebleau for its elaborate decoration that recalls the spectacular Hôtel de Paiva (1863–66).

The Second Empire came to an end in 1870, but the standards of luxury and opulent display that characterised its architecture and decoration were upheld, even surpassed, during the Third Republic that followed. The new interiors in the Palais du Luxembourg, created to house the Sénat in 1879, continued what Napoleon III had begun in the old Salle du Trône which became the Salle des Conférences and was encrusted with heavily modelled Renaissance / Baroque decoration, dazzlingly gilded and painted by Jean Alaux, Henri Lehmann and Adolphe Bruce. The Palais de Justice, which had been partly destroyed during the Commune uprising in 1871, was rebuilt and decorated in a richer manner than before; the Salle d'Audience of the Première Chambre Civile is the most magnificent of the new interiors with a heavily modelled ceiling reminiscent of the Doge's Palace in Venice, painted by Paul Baudry (1828–86) and Elie Delaunay (1828–91), two of Garnier's team at the Opéra. The Hôtel de Ville, which had been completely destroyed in 1871, was rebuilt (1873–83) in a rich Renaissance style by Théodore Ballu (1817–85) and Edouard Deperthes with grandiose reception rooms glittering with gold and painted by Puvis de Chavannes, Jean-Paul

Laurens, Benjamin Constant and more than forty painters and sculptors whose work took its place in the overpowering Renaissance / Baroque interiors. Puvis also contributed painted decorations in the Grand Amphithéâtre of the Nouvelle Sorbonne (1885–89) designed by Henri-Paul Nenot (1853–1934) and the secularised Pantheon (1885).

"Tous les Louis" retained its popularity for theatres, such as Stanislas Louis Bernier's Opéra-Comique (1893–98) and the Théâtre Grevin (originally Joli) designed in 1900 by Antoine Bourdelle with paintings by Gustave-Joseph Chéret, and as an international style for hotels and restaurants. It had little to fear from Art Nouveau which had been developing at Nancy around the figures of Émile Gallé and Louis Majorelle. This style was introduced to Paris by Hector Guimard (1867–1942) who had visited Belgium in 1895 and been impressed by the work of Victor Horta and Paul Hankar. Pieces of furniture in the new style designed in Nancy by Majorelle and decorated with marquetry by Victor Prouvé were shown at the 1900 Exposition in Paris, as were whole room settings by Edward Colonna and Georges de Feure and others in Siegfried Bing's Pavillon de L'Art Nouveau. Five years earlier La Maison de l'Art Nouveau (Louis Bonnier) had been opened in the capital to sell fabrics, glass, pottery and furniture from Nancy and from other countries.

In Guimard's buildings, iron was used in the curvilinear, interlacing forms to which it was suited, both externally and internally, as in Castel Béranger (1894–98), a 36-apartment house in which the entrance doors and staircase balustrades had twisted, sinuous shapes distantly related to the natural forms and twining tendrils of Rococo frames and panels. His designs for fireplaces, mirrors and furniture were all similarly flowing. The same principles were carried into structural forms as in the Salle de Concert Humbert de Romans, Paris (1897–1901) in which the root-and-branch-like frames were exposed as a part of the interior design, reaching up to support a ceiling pierced with yellow glazing. Clusters of electric bulbs, like fruit, hung from the branches. The rooms in his own home, Hôtel Guimard (1909–12), were completely based on curvilinear forms in their decoration and furniture; more attractive is the staircase in Hôtel Mezzara (1910–11) with a characteristic but elegant iron balustrade. The designs Guimard made for the entrances to the Paris Métro from 1899 to 1904 lent publicity to Art Nouveau. This style enjoyed a vogue in glass, pottery, fabrics, graphics and jewellery, but it had little direct effect on interior design, although a commercialised version was used in restaurants such as Maxim's (Louis Marnez 1899), Lucas Carton (1901), the Wagenende brasserie (c.1902), and in Henri Sauvage's fin-de-siècle decorations in the Café de la Paix. The Grand Magasins du Printemps was remodelled c.1907 by René Binet, who created a great free-standing staircase with sweeping lines in the decorative balustrade, and the Magasins Jansen was also redecorated by Sauvage; but there was little enthusiasm at the time for Art Nouveau which soon faded away until it was rediscovered and became a cult fifty years later.

The Paris Exposition des Arts Décoratifs of 1925 was the showcase for the last *style de luxe*; namely Art Deco. But just as the exhibition itself had been planned for 1914, the appearance of Art Deco too had been delayed. Paul Poiret, the couturier, had opened his own decorating business in 1911

France: lady's bedroom by André Groult, 1925

under the name of the Atelier Martine, and at first the influence of Léon Bakst and the Ballets Russes was strong. Oriental luxury and strong colours, dim lighting, low divans with tasseled cushions, were typical of the furnishings displayed in Poiret's showroom, but although some of the comfortable aspects remained in the designs of the 1920s there was also a reinterpretation of the form and character of Louis Seize, Directoire and Empire furnishings. The materials used were characteristic of the exotic tastes favoured by fashionable, wealthy society of the 1920s, and included sycamore, ebony, shagreen, lacquer, enamel and silvered bronze. Marquetry was also used, sometimes inlaid with ivory or mother-of-pearl, a fashion known to Marie-Antoinette. Sometimes furniture was painted – grey, gold or silver – which was an effect that was also much favoured in decorative schemes as a whole and perhaps harked back to late Louis XVI taste and the Salle d'Argent in the Elysée palace.

The Art Deco style was closely associated with the world of haute couture. Jeanne Lanvin commissioned Albert-Armand Rateau to decorate her house in the rue Barbet-le-Jouy and her boutique in the faubourg St. Honoré, and Madeleine Vionnet filled her house with lacquer screens and furniture by Jean Dunand. Jacques Doucet, who collected post-Impressionist, Cubist and Surrealist works of art, brought together leading Art Deco designers to furnish an apartment in Neuilly in 1927. These included Pierre Legrain who made furniture of sycamore and chrome, Clément Rousseau who was fond of shagreen and lacquer, Marcel Coard who used sheets of parchment, layers of tinted glass, mirror and inlays of amethyst and mother-of-pearl, and Eileen Gray (1879–1976) who graduated from the manufacture of elegant lacquered screens and small pieces of furniture to complete interiors. One of Gray's most notable Art Deco ensembles was for the Paris apartment of the couturier Suzanne Talbot (1919–22) which featured satiny white walls, a silvered floor and luxurious Deco-style furnishings. Gray subsequently went on to work in a sparse Modernist style designing angular tubular steel furniture and compact built-in fittings for her own villa at Roquebrune in the south of France (1926–29) and for the Paris apartment of the architect Jean Badovici (1930–31).

Other leading Art Deco designers were Jacques-Emile

France: office interior by Andrée Putman, 1995

Ruhlmann (1879–1933) and André Groult (1884–1967). Ruhlmann's Pavillon d'un Collectionneur was one of the highlights of the 1925 exhibition and contained a large circular salon whose walls were covered with silk, featuring a large repeated pattern of classical urns and formalised flowers and birds. The principal decorative elements were a huge crystal chandelier complemented by related wall lights, and a large panel, *Les Perruches*, by Jean Dupas over the fireplace. The basic idea is no different from that of an 18th-century room; and Groult's furniture and decoration also followed an 18th-century formula, even if the colours, paintings and fashionable character were of the 1920s.

The Esprit Nouveau Pavilion at the 1925 Exposition presented a different sort of interior in the copy of one of the cells of Le Corbusier's Immeubles-Villas housing project with its machine aesthetic. Le Corbusier's early work from Villa Fallet (1907) until Villa de Mondrot (1931) was largely domestic, although he regarded the Villa Schwob at La Chaux-de-Fonds (1916–17) as the first acceptable work in his canon. In *Vers Une Architecture* (1923) he wrote that "the decorative arts are now at the dangerous height which goes before a fall ... exquisite ovals where triangular doves preen themselves or one another, boudoirs embellished with 'poufs' in gold and black velvet, are now no more than the intolerable witnesses to a dead spirit. These sanctuaries stifling with elegancies ... are an offence". The Villa Schwob and the Esprit Nouveau

Pavilion offered an alternative, "machine for living in", which was to be developed more fully in Villa Savoye, Poissy (1928–31) in the open planning and the austere, undecorated forms of the internal spaces that opened up to the surrounding landscape through continuous windows, and in which each permitted item of furniture was a part of the architectural image. Corbusier's intolerance of his client was revealed in an article in *L'Esprit Nouveau* (1921): "When the architect hands over the keys of the house, his heart sinks. He knows that the owner ... will have no compunction in smothering the walls with intemperate wallpapers which will unbalance the spaces, in cluttering the rooms with any old furniture which will annihilate the value of the volumes and in hanging up paintings and prints which will upset the order required by the architect".

The appeal of stripped, functional, impersonal interiors was limited. The millionaire collector Carlos de Beisteguy commissioned Corbusier to design an apartment for him in the Champs Elysées in the early 1930s which included an elegant staircase that spiralled gracefully around a central glass newel; but the novelty quickly wore off and within a year Beisteguy called the apartment an "uninhabitable machine", and filled it with Baroque furnishings. In his château at Groussay he installed a quite different spiral staircase in the sumptuous double-height library that was filled with predominantly Neo-Classical objects and furnishings arranged with a theatrical Baroque opulence. Of the two, Groussay has been more influ-

ential than the Villa Savoye in the eclectic world of haute couture decoration revealed in the pages of *Maison et Jardin*.

The post-war styles such as "Contemporary" and Pop were largely British and American phenomena, but the French designer Olivier Mourgue (b.1939) embraced the more futuristic elements of 1960s design in his sets for the cult film, 2001: *A Space Odyssey* (1967). These featured Mourgue's foam-padded *Djinn* seating (1964) whose low curved shapes were based on exaggerated amoeboid forms.

Since the 1970s, Postmodernism has been strongly in evidence in the work of interior designers such as Andrée Putman, Jean-Michel Wilmotte and Philippe Starck. Andrée Putman (b.1925) has an international reputation as one of France's most elegant and stylish designers, and she has designed numerous apartments and showrooms for top fashion designers Yves St. Laurent, Karl Lagerfeld and Thierry Mugler, and has worked on the interiors of many hotels, galleries, museums and government offices. One of her most widely publicised commissions was the Paris office of Jack Lang, the Minister of Culture (1984), where golden-blond, drum-shaped Postmodernist furniture and High-Tech lamps were dramatically combined with traditional 18th-century gilt panelling and chandeliers. Official encouragement was also given to other Postmodernist designers when the French President, François Mitterand, commissioned Jean-Michel Wilmotte (b.1948) and Ronald Cécil Sportes (b.1943) to decorate the private apartments of the Elysée Palace in 1983. Once again the setting was traditional, and the decoration, inspired by Viennese design of the 1900s, Art Deco and High-Tech, creates a striking mix of the antique and the contemporary. Philippe Starck's witty interpretations of the streamlined Deco and Moderne style have also proved very popular in the United States where he has supervised the decoration and furnishings of several innovative and much-acclaimed hotels: the Paramount (1990) and the Royalton (1988) in New York, and most recently, the Delano in Miami Beach (1995).

Frank, Jean-Michel 1895–1941

French interior decorator and furniture designer

Jean-Michel Frank was one of the most highly regarded of the generation of designer-decorators in Paris who spanned Art Deco and Modernism, although his career lasted little more than ten years. He combined technical perfectionism, ("...one doesn't work in centimetres but in millimetres") and a preference for luxurious, unusual and rare materials, in keeping with the *ébéniste* tradition, with a puritan's taste for simplicity, achieved by sparse furnishing and minimal decoration. His work exemplified Robert Mallet-Stevens's dictum: "You can most luxuriously install a room by unfurnishing it".

Jean-Michel Frank: Vicomte Charles de Noailles' salon, Hôtel Bischoffsheim, Paris, 1929

The hallmark of Frank's early style is his novel treatment of wall surfaces. These were plain, without divisions or mouldings and were covered either in squares of vellum, or in marquetry, painstakingly constructed from split rye straw (a revival of a traditional craft), or painted white. Later he was to favour plain wood panelling, much of it salvaged, often with doors set flush without mouldings. Bathrooms could be lined with marble or travertine. His early furniture was rectilinear, reviving the geometric shapes pioneered by Koloman Moser in Vienna, and included sofas, low, rectangular tables and folding screens. Frank would sometimes incorporate fruitwood furniture of Louis XVI style and later used overstuffed armchairs and sofas with plain upholstery.

There is little evidence that Frank actually made any furniture, but his partner, Adolphe Chanaux, was a consummate cabinet-maker who had worked with André Groult and Jacques-Emile Ruhlmann. He may have introduced Frank to the decorative possibilities of the shagreen and gypsum veneers he favoured for the surfaces of tables and cabinets. They employed a range of craftsmen at their La Ruche workshops: a Spanish vellum specialist, a Hungarian shagreen expert, a team of traditional cabinet-makers and four or five women working on straw marquetry. Leather was provided by Hermès and carpets, textiles and rock-crystal for lamps were also supplied by appointment, from the highest-quality sources. From the

mid-1930s, Frank collaborated actively with artists from his social circle. The sculptors Alberto and Diego Giacometti contributed innovative designs for lamps, vases and mirror frames in white plaster and patinated bronze; Christian Bérard, the painter, introduced colour and decorative pattern into wall decorations (particularly the architectural *capriccios* employed at the Guérlain Institute) and carpet design; Emilio Terry broadened and enlivened the range of furniture designs with Neo-Classical shapes and Greek ornament. In addition, his interiors were often embellished with folding screens with designs by Bérard, Filippo de Pisis and Salvador Dalí.

Frank was left with an independent income after the tragic early deaths of his parents and gravitated towards artistic social groups. In Venice he met Diaghilev and his circle who included Stravinsky and Picasso. Shortly after, he fell under the spell of the elderly South American arbiter of taste, Mme. Eugenia Errazuriz, whose maxim was "Throw out, and keep throwing out! Elegance means elimination." He also met Vicomte and Vicomtesse Charles and Marie-Laure de Noailles, his first important clients, and their circle who included Jean Cocteau, Luis Buñuel and Man Ray. Frank must have met most of his clients through private introduction and by recommendation; he belonged to no design groups and did not exhibit at the salons. He did receive regular media coverage, however, which no doubt helped to publicize his work.

His first published schemes and furniture designs were for his own apartment on the rue de Verneuil, his first collaboration with Adolphe Chanaux, in 1927–28. The drawing room and bedroom were almost indistinguishable; both had plain walls and ceilings totally lined with bleached straw marquetry. The flush doors were similarly decorated, although those in the bedroom had panels of sunburst effect. In both rooms he made use of low tables, veneered in shagreen or irregular gypsum tiles, boxy stools and chairs and half-height screens. The long, rectangular drawing-room sofa in white leather was exchanged for a built-in bed on a plinth, heaped with cushions. His library and dining room were, in complete contrast, hung with full-length net curtains and furnished with traditional, Louis XVI chairs.

Frank's association with the de Noailles included decorations for their villa at Hyères in the South of France, schemes whose details are now lost. Arguably his most important commissions were the rooms for their 18th-century Paris house, the Hôtel Bischoffsheim. The high-ceilinged salon was stripped of mouldings and lined throughout with squares of creamy parchment, resembling blocks of warm stone. Heavy, beige silk curtains hung the full height of the room and burnished bronze doors were recessed into the walls. The fireplace was faced with a vertical brickwork of mica tiles. A rectilinear sofa and club armchairs in bleached, white leather gleamed against a deep chocolate carpet. There were wall cabinets with veneers of straw marquetry in fan-shaped panels and low tables in bronze or shagreen veneer on which sat lamps formed of irregular lumps of rock crystal and asymmetrical slices of ivory. Relations between Frank and his clients were to deteriorate when they hung paintings on the walls and introduced the clutter of their personal effects.

At much the same time, 1929–30, Frank created modern rooms within another historic building, the 16th-century palazzo of the Pecci-Blunts near Rome. For their library, also used as a music room, he created a plain oval, lacquered white, whose book recesses, lined with straw marquetry and illuminated with concealed top lights, alternated on one side with full-length windows of equal size and on the other, with doors also decorated with straw marquetry. Tub-shaped armchairs and a sofa with curved ends were of pearwood, upholstered in beige leather; they were served by elegant gilt-bronze side-tables.

Frank had a number of couturiers as friends and clients. In the late 1920s he decorated the Paris apartment of Elsa Schiaparelli on the Boulevard St. Germain. In her white-painted salon he used new, rubberized textiles for the white curtains and green upholstered chairs, in combination with an enormous orange leather sofa. Black framed tables with glass tops and black porcelain in the dining room must have created a startling effect; no wonder that Chanel, a more conservative friend of Frank, "shuddered as if she were passing a cemetery". In 1936, Frank fitted out the showrooms for Lucien Lelong and Schiaparelli in the Place Vendôme, in a more restrained traditional style. His frilled draperies, plain, pale carpet and the pale sofas and boudoir chairs with their ruched valances and frivolous ear-tassels perfectly complemented the exuberant, Rococo decoration of the salon.

The same ear-tasselled chairs are used to furnish Baron Roland de L'Épée's extraordinary cinema-ballroom, published

in 1939, perhaps Frank's most famous interior. Each wall was painted a different pastel shade with a matching, overstuffed rectangular sofa on gilt, spiral-carved legs set before each except for the pink wall. This was set with a sofa upholstered in Schiaparelli's "Shocking"-pink satin, in the form of the actress Mae West's lips from the design by Salvador Dali. Above it hung a white plaster disc, with a relief design by Alberto Giacometti, which hid the cinema projector lens. In the corners on either side stood two circus boxes with barley-twist balustrades, upholstered in purple velvet. The floor was fitted with a dark red carpet which could be rolled back for dancing. The effect was highly theatrical, betraying the influence of the Surrealist artists with whom Frank collaborated.

In 1937 Frank furnished a living room for the New York apartment of Nelson Rockefeller which had been designed by the architect Wallace K. Harrison. The walls were sheathed from floor to ceiling in polished oak with minimal mouldings and flush cupboard doors. Fireplaces at either end of the room were surrounded by murals by Matisse and Léger, and works by Picasso hung on the walls. Frank supplied an Aubusson carpet patterned with stylized leaves on a solid ground, designed by Christian Bérard, which added further colour to the room. He also provided overstuffed sofas and armchairs with delicate cabriole legs in the Louis XVI style and his hallmark low tables. Diego Giacometti designed lampstands and firedogs in bronze and a gilt, console table supported on abstracted human arms sprouting leaves. A similar decorative treatment was used later in George Born's apartment in Buenos Aires.

Frank created some of his most radically modern interiors for the Templeton-Crocker apartment in San Francisco; somewhere between Ocean-liner style and 1950s Modernism. There were a dining room and breakfast room furnished entirely in lacquer by Jean Dunand and a bathroom with streamlined fittings and floor in black Belgian marble and metal-framed granite walls. The split-level bedroom had a mirror-panelled wall and a platform bed set into a flight of carpeted steps. Most extraordinary of all was the living room, as large as a hotel concourse, which was also used as a music room. The windows alternated with mirror panels around the high walls and there were banks of bushy plants in troughs beneath them. The furniture was uniformly low; boxy, geometric armchairs and sofas, several partly enclosed by half-height screens. There were rectangular, reclining seats and floor cushions, rough-hewn X-frame stools and stone-paved floors strewn with animal skins and Navaho rugs; an electrifying combination of Functionalist chic and American Frontier style.

STELLA BEDDOE

Biography

Born in Paris in 1895; the great-uncle of Anne Frank. Trained as a lawyer. Travelled extensively in Europe, 1920–25; active as a decorator and designer of furniture from c.1925; collaborated with cabinet-maker Adolphe Chanaux from 1927; made designs for the theatre and ballet, 1929–35; opened a shop with Chanaux selling furnishings at 147 rue du Faubourg St. Honoré, 1932. Left France for Argentina via Lisbon, 1939; worked as a decorator in Buenos Aires, 1939; moved to New York, 1940; lectured at the Parsons School of Design

and worked with backing from the interior design firm McMillen. Committed suicide in New York, 1941.

Selected Works

Much of Frank's work is in private collections; examples of his furniture are in the Museum and Art Gallery, Brighton, and the Musée des Arts Décoratifs, Paris. His interiors and furnishings survive, intact, in the Rome apartment of Comtesse Pecci-Blunt and Nelson Rockefeller's apartment, New York.

Interiors

- 1924–33 Villa de Noailles, Hyères (furniture and decoration): Vicomte and Vicomtesse de Noailles
- 1927 Frank apartment, rue de Verneuil, Paris (furniture and decorations): Jean-Michel Frank
- c.1928 Schiaparelli apartment, Blvd. St. Germain, Paris (furniture and decoration): Elsa Schiaparelli
- 1929 Hôtel Bischoffsheim, Place des Etats-Unis, Paris (furniture and decoration): Vicomte and Vicomtesse de Noailles
- 1930 Pecci-Blunt apartment, Rome (furniture and decoration): Count and Countess Pecci-Blunt
- 1935 Georges Born apartment, Paris (furniture)
- 1935 Couturier's showrooms, Place Vendôme, Paris (furniture and decoration): Elsa Schiaparelli
- 1936 Apartment, Paris (furniture and decoration): Mlle. Estevez
- 1936 Couturier's showrooms, Paris (furniture and decoration): Lucien Lelong
- 1937 Jean-Pierre Guérlain's apartment, Paris (furniture and decoration)
- 1937–38 Rockefeller apartment, 5th Avenue, New York (furniture): Nelson A. Rockefeller
- 1937–38 Templeton-Crocker apartment, San Francisco (furniture and decoration)
- 1937–38 Helena Rubinstein's apartment, Paris (furniture)
- c.1939 Guérlain Institute, Paris (furniture and decoration)
- c.1939 Cinema ballroom, Paris (furniture and decoration): Baron Roland de L'Epée
- c.1939 Georges Born apartment, Buenos Aires (furniture and decoration)

Further Reading

The literature on Frank is sparse, confusing and contradictory. The only monograph, Sanchez 1980, has excellent plates but the text is unsatisfactory.

Frank, Josef 1885–1967

Austrian architect and designer

Born in Austria, Josef Frank became one of the most important and influential exponents of modern design in Sweden and his work made a strong impact on Scandinavian Modernism. He grew up in the culturally vibrant and eclectic atmosphere of turn-of-the-century Vienna where he was exposed to the work of the Thonet company and the designers associated with the Wiener Werkstätte as well as the philosophies of Freud and Wittgenstein. Viennese design was also strongly influenced by the ideas of the English Arts and Crafts Movement at this time and especially the work of Charles Rennie Mackintosh and William Morris. Frank himself also greatly admired the clear and simple architecture of Leon Battista Alberti on whom he wrote his doctorate. He declared that man's ideal dwelling is the garden city with one-family houses set in their own gardens.

Frank's first furniture was designed in the 1910s. He was initially influenced by Vernacular and Biedermeier design. However, these influences were soon replaced by that of traditional English furniture and he also became fascinated by the forms associated with Chinese and Japanese design. Increasingly he felt that the models for all furniture lay in English prototypes; they only needed to be adapted to new environments and freed from their nationalistic and historic associations. In 1925, while he was still living in Vienna, he established an interior design co-operative together with Oscar Wlach called Haus und Garten for whom he produced many of the furnishings that would later become classics for the Swedish firm Svenskt Tenn. These included a light Chinese style cane-seat chair, Egyptian stools, an English Rococo armchair and functional sideboards. Facing growing hostility from the Nazis, Frank moved to Sweden with his Swedish wife Anna Sebanus in 1934 where, but for a sojourn of four years in New York between 1942 and 1946 during which he was associated with the New School of Social Research, he remained for the rest of his life.

Frank's move to Sweden was to prove decisive for the history of Swedish interior design. He was invited to work as chief designer for Svenskt Tenn, a company established in the 1920s by Estrid Ericsson. Together Frank and Ericsson produced work that represented a striking alternative to the cold, cubist Swedish Functionalism that was so much in evidence at the time. And in stark contrast to mainstream Swedish design, their room exhibited at Liljevalchs Gallery in

Josef Frank: living room for Svenskt Tenn, c. 1950

1934 included cretonnes blossoming on deep, over-sized, sofas that had soft rounded edges, tables with marble tops, teak furniture, an abundance of cushions and a leopard-skin rug on the floor. Always concerned with the same basic forms, Frank developed his ideas further in the 1940s and 1950s. He particularly liked the shape of the vitrine (a glass-fronted cabinet), admiring both its lightness and the fact that it stands on tall feet or legs leaving a large area of space between the floor and wall visible. Frank's version seems to almost float in mid-air as it is supported on its stand by only a turned ball in each corner. He also worked with the traditional four-poster or canopied bed and updated the Baroque "cabinet of curiosities" in a plain but powerfully elegant "cupboard with 19 drawers". Works such as these exercised a powerful influence on contemporary design and the introduction to an exhibition held at the National Gallery in Stockholm in 1952 declared: "One can very well ask if anyone has had a stronger impact on the formation of Swedish furniture and interior design than ... Austrian Josef Frank".

Frank's attitude to interior design is deeply rooted in his ideas about housing. As an architect he was a pioneer Functionalist belonging to the radical circle of Modernist

architects working in Vienna in the 1920s. But in his designs for interiors he rejected this approach. Indeed, the very essence of his approach to interior design was that the interior of a house should not conform to its exterior. He believed that the fast busy life led by modern people required its antidote and that it was only in cosy, comfortable surroundings as opposed to Modernist or Artistic interiors that they would be able to relax.

Frank also maintained a sharp distinction between works of art and objects for use. Art, he claimed, was something finished, whereas the home should be a living organism whose furnishing is an ongoing process. He called this process "Accidentism", meaning that surroundings should be designed as if they had come about by chance, and declared "A room where one can live and think freely is neither beautiful, nor harmonious nor photogenic". Frank also disliked monochrome surfaces, describing their immediate impact as unsettling; patterned surfaces, by contrast, were praised as calming because they beguiled and intrigued the observer. He therefore advocated the free use of different patterns and colours in upholstery, curtains and carpets – and his own designs for textiles included bold forms taken from nature and bright

colours – but declared that walls should be whitewashed to maintain a balance in the modern house. Furniture should not attempt to become part of the architecture by being static but should be small, light and movable. Individual pieces should be placed wherever they are needed at the time and should never be larger than is required or they risk running contrary to the basic aesthetic principle of economy. Large furniture makes the room look small, whereas small furniture makes it appear large. Following these principles Frank created nonconformist interiors for free-thinking individuals. The seats and backs of his chairs are never square since “anyone choosing for himself a chair with a square seat harbours totalitarian sympathies in some corner of this heart”. And another classic item designed for Svenskt Tenn was a sofa table of amboyna wood, the top of which has edges that float irregularly outwards like a puddle of water. The surface of the wood was extremely important to Frank who claimed that wood is to the craftsman what colour is to the painter. Hence, his furniture was never stained, and if on occasions it was painted this was in accordance with the colour scheme of a particular room.

Despite his humble and retiring personality, Frank harboured no false modesty about his achievements: “I have saved Swedish interior design and created the Scandinavian style. Before me Bauhaus was the only inspiration”. He also showed that furniture, in the true sense of the word, cannot be achieved through formulas, and that the designer must have real creative ability in order to produce furniture with character. Frank’s own creativity was inspired by the past and he created furniture that was not only modern but also timeless. He introduced colour and pattern into the Swedish home, transforming it into a jungle of trees exploding with flowers, fruit and vegetables. And if the work sold by Svenskt Tenn catered for an elite, wealthy clientele, its influence reached a far wider audience than its immediate customers and continues to do so today.

PIA MARIA MONTONEN

Biography

Born in Baden bei Wien, near Vienna, 15 July 1885. Received a Ph.D., 1910. Married Anna Sebanus, 1912. Active as an architect and designer of interiors and furniture in Austria and Germany from 1910; worked in Sweden from 1934. Professor of Building Construction, Wiener Kunstgewerbeschule, 1919–25; taught at New School for Social Research, New York, 1942–46. Founded interior design cooperative, Haus und Garten, Vienna, with Oskar Wlach, 1925–34. Chief designer at Svenskt Tenn, Stockholm, 1932–67. Awarded the Grand Austrian National Prize for Architecture, 1965. Exhibited at Paris 1925, Stuttgart 1928, Paris 1937, and New York World’s Fair 1939. Died in Stockholm, 8 January 1967.

Selected Works

A large collection of Frank’s drawings and designs for furniture and textiles, photographs and additional documentation, is in the Svensk Tenn archive, Stockholm. Examples of furniture are in National Museum, Stockholm, and the Museum of Decorative Art, Vienna.

Interiors

- 1912 Museum for Eastern Asian Art, Cologne (interiors)
- 1927 Villa Claeson, Falsterbo (building and interiors)
- 1927 Villa Carlsten, Falsterbo (building and interiors)

Frankl, Paul 1887–1958

Austrian-born furniture designer and author

Trained as an architect in his native Vienna and later in Berlin, Paul Frankl also studied at art schools in Paris and Munich before emigrating to America in 1914. During his early years in America he worked for the theatre but his main creative interest was furniture and domestic interiors, and it was in these spheres that he rose to prominence both as a practitioner and writer. At the forefront of Modernist American design in the 1920s and 1930s, and embracing both moderne and streamlined forms, Frankl not only fought to achieve recognition for the designer’s central role in the decorative arts, but also pioneered the search for a modern aesthetic that would reflect the rapidly changing lifestyle of big-city America.

Frankl theorised about a distinctly “modern American” style, unrelated to outdated and inappropriate revivalist models, but in practice it was difficult for designers to overlook the strong design trends coming from Europe. A visit to Japan early in his career proved deeply significant, and many of his pared-down interiors, several of which include the use of delicate screens and coloured lacquer finishes, suggest a Japanese influence.

Frankl: bedroom furniture from *Form and Re-Form*, 1930

He rose to fame in the late 1920s for his “sky-scraper furniture”; a series of tall stepped bookcases, desks and combination units, in which he emulated the horizontality and profile of early stepped skyscrapers, thus achieving an “American” form unmistakably reminiscent of the urban skyline. These dramatic, geometric pieces, devoid of ornament, were custom-made pieces made from expensive materials, often polished woods defined with a contrasting material such as metal-leaf, ebonized wood or coloured lacquer. A large combination bookcase and desk (1927) made of California redwood trimmed with black, or a lacquered skyscraper dressing-table (c.1928) featuring a tall mirror set between stepped-back cabinets of drawers and cupboards with silver handles, are fine examples of his singular invention during this period. Frankl argued that his skyscraper furniture responded to the exigencies of apartment living, where floor space and storage were at a premium, although lack of space was probably not a concern for the socially elite customers who visited the Frankl Galleries, which he had opened on Madison Avenue, New York in 1924.

Frankl's work began to receive critical attention in home and furnishing magazines, and a whole room of his skyscraper furniture was featured among the work of American and European designers in R.H. Macy & Co.'s 1927 “Art in Trade” exhibition. He promoted his own and other Modernist designers' work from the Frankl Galleries, and was also a founder and active member of the American Designers' Gallery, established in 1928, and the American Union of Decorative Artists and Craftsmen (AUDAC) formed in 1930. Although these groups were short-lived, mainly due to the economic depression, both aimed to raise the profile and status of decorative artists, bringing their work to public attention

through exhibitions. *The Annual of American Design 1931*, produced by AUDAC, included chapters by leading members such as Kem Weber and Frank Lloyd Wright, with Frankl contributing the section “The Home”. Frankl's books *New Dimensions* (1928) and *Form and Re-Form* (1930), both lavishly illustrated, mainly with dramatically photographed interiors of his own and other designers' works, were important in promoting new American design and theory.

As Frankl himself wrote, his skyscraper furniture represented only one phase of his creativity, but he was much aggrieved at the derivative and shoddy mass-produced versions of his work that later appeared. He was committed, theoretically at least, to the notion that the machine was the tool, not the slave, of a creative designer and could be harnessed to mass-produce functional objects with clean and simple lines. Nevertheless, he was unable in *Machine-Made Leisure* (1932) to find an easy solution to the modern dilemma of “deplorable” machine-made objects. He argued for the training of designers for industrial applications but admitted his own furniture was custom-made in the craftsman tradition for an elite and sophisticated clientele.

His writings confirm his strong opposition to the practice of producing furniture in historical styles, such as pseudo-Renaissance, which he saw as totally removed from the lifestyle of modern America. Frankl's appreciation of the rapidly changing social conditions of men and women in the urban environment led him to suggest a far more flexible and practical approach to interior design. His ideas for a new cost-effective house to be designed by AUDAC for the 1933 Chicago Century of Progress Exposition included strong collaboration between architect and designer, making walls function as furniture with hanging and storage space, practical bathrooms and kitchens, and built-in space-saving furniture inspired by the interiors of contemporary ocean liners.

In his own furniture he moved on to embrace a more horizontal aesthetic, claiming that skyscrapers were a “passing fad” and that American life was fundamentally horizontal, which he equated with speed, both of change and movement. Closely in touch with the changing designs of automobiles, liners, gadgets and electrical products, Frankl continued to create unique furniture, accessories and interiors using a variety of materials. He promoted the use of new industrially produced materials like Bakelite and Formica, and made imaginative use of the creative possibilities of cork, glass and mirrors. He was vehement, almost Ruskinian, in his belief that materials should be true to their nature – insisting that man-made materials should not masquerade as wood or metal, while natural materials should reflect their true characteristics.

Frankl's creative life was marked by several stylistic changes, but he was consistently aware of the visual and aesthetic potential of carefully juxtaposed materials, textures and colour. In a 1932–33 streamlined easy chair he contrasts a dark leather upholstered frame with thickly textured beige fabric cushions, and the shiny angular frame of an early 1930s chair is upholstered with matte black leather. He successfully used thin cork veneer in furniture he designed for the Johnson Furniture Co. and was excited by the potential of thick rattan which he heated and bent to detail low glass-topped tables or form the frames for outdoor furniture. In 1938 he published

Space for Living, a book on interior design which was illustrated with photographs of his clients' homes.

While continuing to design and write, Frankl also demonstrated his dedication to the decorative arts through teaching. He lectured at the Metropolitan Museum of Art, and taught at New York University and later at the University of Southern California, Los Angeles.

MARY PESKETT SMITH

Biography

Paul Theodor Frankl. Born in Vienna in 1887. Studied in Vienna, Paris, Munich, and Berlin. Settled in the United States, 1914. Opened a retail furniture shop, the Frankl Galleries, New York, 1924. Lectured and wrote on furniture and interior design. Founder-member of American Designers' Gallery, 1928, and American Union of Decorative Artists and Craftsmen, 1930. Active as a designer in New York and California. Published several books on design. Died in New York, 1958.

Furniture Retail Trade

During the 19th century the nature of the purchase of domestic furniture and furnishings changed radically. The growth in

demand, not only from an expanding population, but also from a growing class of citizens who wanted to express themselves through their furnishings and decoration meant that changes in the distribution system were essential.

The old arrangement of the maker also being the supplier to the customer took a long time to die out. For wealthy clients it was *de rigueur* in the 18th and 19th centuries to visit show-rooms of the direct supplier, who in many cases was able to offer a complete interior furnishing and decoration service. The importance of this relationship was noted in 1747 when it was suggested that the upholsterer was "that man on whose judgement I rely for the choice of goods; and I suppose he has not only judgement in the materials but taste in the fashion and skill in the workmanship".

However for the majority of the new strata of customers, the rise in the 19th century of the retail store, which was able to supply fashionable furniture and furnishings, provided the route to establishing a home. Inevitably these new consumers had little idea about how to furnish and what to purchase, so they were even more reliant on the retailer. Although general stores and cabinet-making and upholstery businesses were able to meet some of this new demand, two new breeds of retailer developed. These were department stores and specialist furnishing stores, established in the main cities; many were to become household names in the 19th century. Pratts of Bradford, Robson's of Newcastle, Wylie and Lochhead of Glasgow, Maples, Shoolbred, and Waring and Gillow of London, are a sample of the specialist furniture suppliers that developed substantial retail businesses. Visits to department stores such as Fraser, Lewis's, and Harrod's became a favourite shopping experience. These firms were very conscious of the need to develop and inspire customer demand, and to this end they produced a range of innovative methods to inspire customers and make sales. The use of window displays to attract customers was to become widespread. The construction of room settings within the store allowed customers to visualise a complete scheme before it was made up in their home. These sorts of firms were able to design and supply the whole range of house furnishings as well as often supplying bathroom equipment, central heating, kitchen requisites and other items.

One of the most successful tools these specialist firms developed was the illustrated catalogue and estimates of schemes. These productions could range from a simple single sheet listing the proposed selection of goods to a full-scale illustrated catalogue complete with a variety of estimates for varying sizes of house and price ranges of merchandise. In addition, the opportunity to pay for goods on deferred terms – hire-purchase – was soon encouraged, although its heyday was not until the 20th century.

In the late 19th and early 20th centuries in the United States furniture purchases were often through mail-order catalogues. Any item of furniture could be purchased from the catalogues of Sears-Roebuck or Montgomery Ward and be dispatched to any part of the country. From this business there developed a range of department stores that supplied furniture, among other items; these stores have now become major forces in American furniture retailing. The large shopping malls in North America are often anchored to a Sears, Simpsons, Eatons or Macy's store. These businesses have enormous influence over contemporary American taste.

In England it was the development of multiple furnishing stores such as the Times Furnishing Co., John and William Perring, Cavendish Woodhouse and others, that were to use the idea of credit purchase as a major incentive to buy furniture. These stores generally carried a more limited range of stock and would concentrate on cabinets, upholstery, bedding and carpets, leaving other specialists to supply wallpapers and kitchen and bathroom fittings, etc. Their growth was great between the wars, so that by 1939 they controlled some 20 per cent of the retail furniture trade. In the latter part of the century these firms continued to grow either organically or by amalgamation. By the 1980s their concentration into two or three large groups meant that choice was often relatively restricted. For example at the height of the 1980s boom the Harris Queensway group controlled more than 750 outlets with an estimated 13 per cent of the total market.

In contrast to these stores, during the 20th century there was a small coterie of independent shops that promoted "modern design". Heal and Sons had been one of the first to introduce ranges of furniture intended for a particular group of customers. They were followed by businesses such as Dunns of Bromley, Bowmans of Camden Town and Oscar Woollens of Finchley. The efforts of these and other firms in promoting Modern design were far in excess of their physical size. In some cases other companies attempted to take some of this exclusive market; Waring and Gillow established a "Modern furniture department" under Serge Chermayeff, and Fortnum and Mason also tried to tap this trade.

The post-World War II period was characterised by a continuation of the previous methods of furnishings and the growth of a range of specialist furnishing businesses which were more akin to an interior decorator type of trade than the high street image. These were often single stores with their own identity but they might belong to bulk buying groups to improve their profitability. They were often members of the National Association of Retail Furnishers and took pride in their quality of service and supply.

During the later part of the 20th century there was another development, the concept stores. This new form of business was established to develop a new market, namely the younger, more design-conscious and affluent customers of the 1960s and onward. The Habitat range of stores was the most obvious example of this development, whereby one particular taste is catered for under one roof. Terence Conran had recognised that there was a need for stores that would sell a complete ambience or lifestyle, and after his initial success others entered that market at various levels. Sometimes these were small independent companies with one branch, others, like the Ethan Allen company in America, moved towards the decorator end of the trade, while yet others might be multiple businesses with world-wide interests such as the Roche-Bobois company.

Alongside the boom in DIY (Do-It-Yourself), there has also been an expansion in the market for self-assembly furniture. Increasingly this has been sold by warehouses and DIY superstores giving an advantage to customers in terms of price and availability. The success of these outlets encouraged the idea of furniture superstores. Based on the warehouse principle and self-selection, a vast array of cabinets, dining room furniture

and three-piece suites are on display with a smaller selection of other items. These businesses trade on price advantage and quick delivery, but offer little in the way of service, and in England eventually lost their appeal. In the United States they continue to be a favoured furniture outlet, where sophisticated displays and selling systems are combined with stock delivery or take-away systems.

One particular furnishing business was able, however, to combine the advantages of superstore-style trading with a very particular ethos of design and management. This is IKEA. Originating in Sweden, the company is now the largest furniture retailer in the world. In 1993 the company operated 111 stores in 24 countries, employed 20,000 workers and had world-wide sales of £2.2 billion. By offering competitively priced and well designed and made products IKEA has been able to meet a wide range of demands from a large cross section of the public across the world. A significant part of their business is the production of a comprehensive catalogue published in ten different languages but always offering the same range of goods.

Other Scandinavian enterprises supplying interior products and furniture based on a particular design ethic include the famous NK department store in Stockholm and Den Permanente in Copenhagen, both renowned as centres of design excellence.

The continual growth of the domestic furniture market has meant that there is more and more demand for choice. To satisfy this there has now developed a range of furniture retailers who are specialists in particular fields, whether these are inspired by price, design, style or image. These shops may specialise, for example, in 18th-century reproduction furniture, Shaker-style interiors, a chic contemporary or a country house image. Whatever the case, this attention to particular niches of the market will ensure that the role of the retailer remains an important part of the creation of an interior.

G

Gabriel, Ange-Jacques 1698–1782

French architect

The Gabriel family already had a long history of service to the crown when Ange-Jacques succeeded his father Jacques (1667–1742) as First Architect to King Louis XV (Premier Architecte du Roi). He held this position for 33 years (1742–75), eventually retiring with great professional and personal honors at the age of 77. Well-known as the principal French architect working at mid-century, Gabriel was responsible for a number of building projects. These include: Châteaux at Compiègne and Saint Hubert, the small Pavillon Français, Le Butard and Petit Trianon, and important additions to existing Royal residences at Versailles, Fontainebleau, Choisy, and Paris. The seemingly impossible list of accomplishments credited to him includes not only the building projects themselves, but also their interior decor, as well as renovated interiors for almost all of the royal residences.

Gabriel's role as an interior designer has engendered much debate due to the strong spirit of collaboration that existed between the architect and his decorative sculptors (*sculpteurs*). This is particularly relevant to his relationship with Jacques Verberckt (1704–71) and Antoine Rousseau (1710–82), with whom Gabriel worked on many projects. An examination of the drawings of architectural interiors executed by Gabriel and conserved in the Archives Nationales, Paris makes it clear, however, that Gabriel played a considerable role in shaping the taste of interior design of his time. And this time heralded a transition from the elegant exuberance of the Rococo to a more reserved academic classicism much championed by Gabriel.

Gabriel first emerged as an interior designer at Versailles when he contributed plans for the newly refurbished Queen's bedroom (Chambre de la Reine) in 1735. Although working in conjunction with his father and Robert de Cotte, the young Gabriel envisioned the long, narrow panels that included gilded medallions at both ends and in the center. These panels framed large mirrors mounted over the chimneys, which were ornamented with gilded palm tree motifs. The bedroom was originally renovated for Queen Marie Leczinska; Gabriel would later alter his own decor to include emblematic references to Queen Marie Antoinette. He continued a blatantly Rococo approach to architectural interiors when he was

commissioned by Louis XV to transform his whole private apartment at Versailles (1738–75). Here the white walls and ceiling of the King's bedroom were ornamented by carved, gold-gilded panels (*boiseries*) which incorporated trophies, busts, medallions and an array of vegetal motifs that give the room a feeling of lightness and gaiety. Although clearly conforming to the Rococo taste of the time, Gabriel avoided the asymmetrical inventions of Gilles-Marie Oppenord, Nicolas Pineau and Juste-Aurèle Meissonnier, in favor of a more symmetrical and ordered interior decor. In the King's Council Chamber at Versailles of 1755, considered a magnificent example of Gabriel's Rococo phase, he already shows a stronger approach with the large, very three-dimensional medallions surmounting heavily outlined panels decorated with cherubs acting out the role of the King. Classical-style consoles link the cornices between the wall and the ceiling, which is now free of ornamentation.

It is in his small pavilions that Gabriel's natural inclination towards a statelier, more classical approach becomes apparent. This appears first at the Pavillon du Butard and the Pavillon Français, both dating from 1750, but may be seen most dramatically in his unabashed masterpiece, the Petit Trianon. Begun for Madame de Pompadour in 1763 but not completed until after her death (1764), this reserved square building has a flat balustraded roof and a minimum of exterior decoration which includes pilasters and engaged columns in the Corinthian order. The dignity and symmetry of the exterior elevations were echoed in the interior rooms designed by Gabriel and carved by Honoré-Guibert, a new *sculpteur* associated with the "goût grec" chosen to replace the Rococo Verberckt and Rousseau. In the salon de compagnie one finds long, plain, painted wall panels decorated quite sparingly at the bottom with garland crowned medallions and a running spiral motif. The chapel of the Petit Trianon is even more classical in its inspiration. The altar area is supported by consoles and flanked by Ionic columns that support a rounded pediment. The rest of the room is covered with totally unadorned wooden wainscoting, with only simple garlands appearing above round arched niches. Gabriel's dramatic change of style reflected the general change of taste in France at this time from the playful fantasies of the Rococo age to the more serious Neo-Classical. This was a change first initiated by Louis XV and Madame de Pompadour but more often associated with Louis XVI.

Gabriel: *Chambre de la Reine*, Versailles, from 1735

Appropriately, the classical elements in his large-scale late projects were stronger and grander than in his small pavilions. Free standing and engaged columns in the Doric, Ionic and Corinthian orders may be seen throughout the *École Militaire*, a project first conceived in 1750. They are incorporated into plain, almost austere rooms, as may be seen in the chapel of the infirmary, where exaggerated guttae and garlands in the circular dome form almost the only ornamentation. Classical orders are again the focus in the much more elaborate interior of the Opéra at Versailles (1770). Here gilded Corinthian columns, three storeys high, flank the stage and balcony areas, while smaller Ionic columns surround the theater on the third floor. A cartouche held by angels and rays of light surmounts the stage area, while sphinxes, shells, trophies, garlands and putti holding crowns are all incorporated into the richly colored and gilded decor. Although many of these motifs could be found in his earlier Rococo interiors, they are used here in a much stronger, more powerful manner. Louis XV's magnificent opera, carved by Pajou, overwhelmed royal visitors when it was inaugurated on the occasion of the marriage of the Dauphin and Marie Antoinette.

Considered his most dazzling triumph in terms of architectural interiors, the Opéra at Versailles was a fitting note on

which Gabriel could retire. He did this in 1775, shortly after the death of his patron and friend Louis XV. He was sickly and almost blind by this time but had ample reason to be proud of his success. Even so, with all of his accomplishments Gabriel was often criticized by his contemporaries for borrowing from other artists and spending too much on his projects. There is no doubt, that he depended on an array of architects and sculptors at the Royal Building Works (*Bâtiments du Roi*) to assist him in his many commissions. His brilliance was at assimilating the best of the ideas that were most popular at the time and incorporating them into buildings of great taste and beauty.

KATHLEEN RUSSO

Biography

Born in Paris, 23 October 1698, the son of Jacques Gabriel (1667–1742), *Premier Architecte du Roi*. Trained by his father; enrolled at the *Académie de l'Architecture*, Paris, 1728. Married Catherine de la Motte, 1728: 3 children. Worked as an architect on royal buildings under his father from 1729. Member (first class), *Académie*, and succeeded his father as *Contrôleur* of Versailles, 1735; appointed *Premier Architecte du Roi*, and *Director, Académie Royale*, 1742; retired, 1775. Died in Paris, 4 January 1782.

Selected Works

Large numbers of Gabriel's drawings are in the Archives Nationales, Paris. A full list of his architectural commissions appears in Tadgell 1978.

Interiors

- 1738–75 Palais de Versailles (renovations and additions including the completion of the right wing, and interiors including the state apartments, private apartments, and the Chambre de Conseil, 1755)
- 1744 Place Royale, Bordeaux (completion of work by Jacques Gabriel; interiors include panelling by Verberckt)
- 1746 Château de la Muette, near St. Germain (renovations)
- 1747–82 Château de Compiègne (renovations and additions, including new apartments for the king and queen and dauphin: completed posthumously)
- 1749 Château de Fontainebleau (renovations, additions and Great Pavillon)
- 1750 Pavillon Français, Palais de Versailles (building and interiors)
- 1750 Le Butard (hunting lodge), near Versailles (building and interiors)
- 1750–68 École Militaire, Paris (building and interiors including the chapel, library, exercise room, governor's apartment and council chamber)
- 1751–55 Château de Fontainebleau (additions, renovation of the King's Bedroom and the Council Chamber)
- 1753 Hermitage, Choisy (building and interiors)
- 1755–74 St. Hubert, near Rambouillet (additions to hunting lodge, including the Great Circular Salon)
- 1761–68 Petit Trianon, Opera House, and Hermitage for the Trianon, Palais de Versailles (buildings and interiors)
- 1772–73 Château de Fontainebleau (renovations and additions, including the Comtesse du Barry's salon)
- 1773 Château de Bellevue, near Paris (dining room)

Further Reading

A recent scholarly account of Gabriel's career, incorporating detailed sections on his work at the Royal residences, appears in Bottineau and Gallet 1982, which also includes notes of the drawings related to his principal projects and a full bibliography. Galleries

The history of galleries concerns the evolution of two distinct but nonetheless closely related rooms: the Long Gallery and the Gallery for the display of art. Long galleries were an important feature of grand houses from the 16th to the early 18th century, while galleries for the display of art developed from the late 17th century and paved the way for the public art gallery as it is known today.

Long galleries originated in France in the late Middle Ages as covered walks, sometimes open on one side, with a view through to a garden or courtyard. Their principal function was to provide an area for exercise and they evolved in response to physicians' convictions that walking was good for health. While the extensive grounds and garden surrounding great houses afforded ample opportunities for exercise outside, covered walks were an ideal way to take exercise in bad weather and, in winter months, offered a refuge from cold and rain.

Enclosed 16th-century galleries were long, narrow spaces that sometimes served as a corridor between the separate wings of a house or ran along its entire length. Some country houses had two galleries built one above the other. This is the case at The Vyne, Hampshire, which boasts England's oldest long galleries. The lower gallery was open and loggia-like while the upper gallery, which survives intact, was closed and had walls lined with linenfold panelling that was decorated with painted grotesques, crests, arms, and initials. Thornbury Castle (1520) also had an upper and lower gallery but these were designed as a two-storey cloister walk, surrounding three sides of an enclosed garden, the fourth side being attached to the main body of the house. These cloister-style galleries were in essence exercise circuits and often had fireplaces to warm walkers in cold weather.

Exercise or "communicating" galleries as they were also known, were built in increasing numbers in wealthy houses all over Europe throughout the 16th century. They were gradually integrated into the main body of the house but were usually built along the outer wall to guarantee a view. In England, the changing decoration of galleries reflected their growing importance. Initially, the walls were often hung with tapestries and the floors were covered with rush matting but they contained little or no furniture thus emphasising their role as a place for parade and exercise as opposed to comfort. From quite an early period, however, they were also being used to display paintings. Henry VIII's gallery at Hampton Court contained nineteen paintings from his collection and set a precedent that other members of the court gradually began to follow. Paintings collected for galleries during the 16th and early 17th

Galleries: Long Gallery, Aston Hall, near Birmingham, early 17th century

centuries were mainly portraits (a peculiarly British phenomenon) and were chiefly intended as a diversion during exercise. They generally depicted existing family members and ancestors, but might also include monarchs and famous historical figures and served as both inspiration to the viewer and as proof of the household's good connections. Bess of Hardwick, for example, hung portraits of past kings and queens as well as members of her own family in the Long Gallery at Hardwick Hall, Derbyshire, in the 1590s and the Brown Gallery at Knole contained a huge series of uniform portraits of medieval kings and remote family ancestors by Jan van Belknap, a Flemish artist working in England in the early 17th century.

As painting collections grew, galleries became increasingly opulent in their decoration and furnishings and even began to approach the magnificence of the great chambers in palaces and country houses. In the great "prodigy" houses of the Elizabethan and Jacobean periods, the ideal sequence of rooms included a great chamber, a withdrawing chamber, a best bed chamber and a gallery en suite. Galleries were usually located on the same floor as the great chamber but were sometimes sited on the floor above as at Hardwick or Worksop Manor (1580) where the second floor long gallery measured 212 by 36

feet, had a continuous glass lantern and stood fifty feet above the ground providing magnificent views of the local landscape.

Increasingly, galleries developed ever more diverse functions, offering a supplementary space for entertainments and recreational activities such as music, masques, and games such as billiards, shuttlecock and shovel-halfpenny. Lord Petre's gallery at Ingatstone in Essex contained a large table or "shuffle-board", as well as six paintings, nine painted shields, chairs and stools.

Galleries were also a common feature in wealthy Italian houses in the 16th century where they were based on the French example. François I's gallery at Fontainebleau proved to be hugely influential in Italy as Italian artists had been largely responsible for its decoration. The gallery at the Palazzo Spada in Rome (1548–49), designed by the architect Il Baronino, was inspired by Fontainebleau as was the gallery at the Montebello family castle in Piedmont (1512), an Italian province closely linked to France.

Although European galleries had originated primarily as exercise and entertainments rooms, in Italy they rapidly evolved as a space in which to house growing collections of paintings, curios and antiquities that had become too large to

store in the collector's private *studiolo* or closet. It was customary to have the gallery annexed to the *studiolo*, which acted as a treasury or office from which the collector or specially employed curator could study and manage the collection. An early 17th century treatise by Giulio Mancini entitled *Considerazioni sulla pittura* actually advises on the management of painting collections in galleries. These collections were often so densely hung that decorative wall hangings were unnecessary.

By the late 17th century, European galleries included some of the most lavishly appointed and influential interiors of their time: the gallery in the Farnese Palace in Rome (1597–1660) decorated by Annibale Carracci, and the Galerie des Glaces at Versailles (1678) both fall within this category. And this opulence reflected the changing function of the gallery which was increasingly regarded as the place in which to display properly substantial collections of art. European monarchs had individually amassed celebrated collections of paintings, sculptures and other *objets d'art* and their activities were emulated by the aristocracy and wealthier members of the bourgeoisie. There was already a general preference for Italian Renaissance artists ("old masters") as can be seen in David Teniers' painting of the *Picture Gallery of Archduke Leopold Wilhelm of Austria* (1647) which shows framed paintings by Raphael, Giorgione and Titian, and these were added to during the 18th century with collections of classical statuary and works by Dutch masters.

In England, discriminating collectors, known as virtuosi or dilettanti, were rich, cultured individuals who had invariably started collecting while on their European Grand Tour, and many of their collections have formed the basis of Britain's national heritage. The sizeable collection of Elias Ashmole, for example, who was considered the greatest virtuoso of his time, became the Ashmolean Museum in Oxford. And Lord Burlington, also a celebrated virtuoso, displayed the spoils of his Grand Tour in the purpose-built villa, Chiswick House, whose interiors were decorated by William Kent, and which can be regarded as one of the first free-standing public galleries. Other important "art" galleries of this period include the 2nd Earl of Egremont's gallery at Petworth (1754) which housed its owner's collection of antique sculpture, and Robert Adam's sculpture gallery at Newby, Yorkshire (1760s).

By the mid 18th century, picture and sculpture galleries were important features in almost every wealthy house of considerable size. Owners of these houses, proud of their collections of paintings and objects were prepared to show complete strangers with the appropriate letters of introduction around their more formal reception rooms, and galleries, in particular, proved a popular attraction for country house visitors. Some even had their own guidebooks, and the gallery at Petworth was apparently constantly filled with copyists, foreign visitors, cognoscenti or the simply curious. But by the end of the century it was becoming increasingly common for owners to want to live with their treasures rather than to confine them to a specific room. Paintings were scattered throughout the house and were grouped according to size or theme to suit the function and decoration of different rooms. Within this context, galleries became a place in which to hang old-fashioned portraits of ancestors and those paintings that were not suitable for more important rooms. And as country

house architecture became more compact and their inhabitants spent more time in town, the sumptuous private galleries characteristic of earlier times became less of a priority. Similarly, by the Victorian period, the function of the long gallery as a place of recreation and indoor exercise was served both by the library-sitting room and by billiard rooms.

Garnier, Charles 1825–1898

French architect

"What kind of style is this?" demanded the Empress Eugénie of the young architect whose design for the Paris Opéra had been selected in competition in 1861; "It is not a style: it is neither Greek, nor Louis XVI, nor even Louis XV". Charles Garnier, forgetting protocol, replied "those styles have had their time. It is Napoleon III, yet you complain". The building was not completed until 1874, by which time the Second Empire had collapsed and the Emperor and Empress were in exile; but the Opéra is not only Garnier's masterpiece but also the supreme monument to the remarkable reign which had seen the transformation of Paris with the newly imposed pattern of boulevards, impressive public buildings and open spaces. Internally and externally it symbolises the 18 glittering imperial years. As for the style, it draws most heavily on Michelangelo and the Baroque theatre.

Garnier was the son of a blacksmith, but he attended various classes and schools until he was able to obtain entry to the École de Dessin in Paris in 1838, and then four years later he was admitted to the École des Beaux-Arts. In 1848 he won the Grand Prix de Rome and began a period of five years study in the Villa Medici. In 1851 he made a tour of Southern Italy and Sicily, and evidently he was impressed by the Pompeian frescoes he saw. He made brilliant gouache copies of a number of them, which reveal an interest in vivid polychromy as well as in the scenographic nature of much Pompeian decoration with its different planes and framed views in perspective. His

Garnier: staircase, Opéra, Paris, 1861-75

final *envoi* in 1852 was a restoration study of the Temple of Jupiter at Aegina, once again rendered in rich polychromy which, he admitted, was speculative rather than based on archaeological evidence. The effect is astonishing, but undoubtedly decorative.

At first after returning to Paris there was little to suggest that seven years later he would be the winner of the prestigious Opéra competition which immediately placed him among the leaders of his profession. In *Charles Garnier's Paris Opéra*, Christopher Curtis Mead has provided a detailed account of the background to the competition and of the genesis and construction of the magnificent building in which the auditorium occupies only a small part of the total area. As Edwin Sachs suggested in *Modern Opera Houses and Theatres*, "the audience and its entertainment perhaps only had a subsidiary place in the general conception" (Sachs, 1897). He also pointed out that the plan allowed "an extensive vista in nearly every direction [and was] one of the greatest achievements ever accomplished in the planning of a public building". These vistas are integrated in the theatrical spaces that begin in the relatively sober Grand Vestibule in which homage is paid to four composers, Lully, Rameau, Gluck and Handel.

This leads to a slightly higher level which brings the opera-goer into a complicated sequence of levels and perspectives that can be likened only to the theatrical designs of the Bibbiena family which have been described as "uninhabitable dream spaces that could not but become vulgar in the reality of stone". Garnier too has often been accused of vulgarity, but he handled with imagination and panache the way in which each space is extended visually into the next through dividing screens, and how light is used to heighten the theatrical quality by contrasting brightness and darkness. All the vestibules, foyers and corridors are ultimately leading from and to the Grand Escalier, the apotheosis of the staircase and the focal point of the plan rather than the auditorium itself. In *Le Théâtre* (1871) Garnier wrote at length about his conception of the staircase as "a sumptuous and lively place [where] the decorative arrangement is elegant [and] the animation that reigns on the steps is an interesting and lively spectacle. Finally, by disposing fabrics or hanging draperies, girandoles, candelabra or chandeliers, then marble and flowers, colour everywhere, one will make of this ensemble a sumptuous and brilliant composition that will recall in real life some of the splendid dispositions that Veronese fixed on his canvases".

The ceiling of the heavily modelled Grand Foyer was painted by Paul Baudry in a complex iconographical programme after studying Michelangelo's work in the Sistine Chapel, while the Avant Foyer ceiling was executed in mosaic by Salviati and Facchina with elaborate arabesques and mythological figures. The ceiling of the auditorium was painted by Eugène Lenepveu, but regrettably this was covered up in 1964 when Marc Chagall was commissioned to paint a substitute. The auditorium itself, heavily modelled and subfuscly gilded, despite its richness and red drapings and upholstery, tends to be an anticlimax after the splendour of the approach to it. At the back of the 47.75 metres deep stage Garnier placed the Ballet Room, a sumptuously decorated and gilded apartment which can be opened up to the stage to add another dimension and an additional 20 metres to the depth.

Garnier took complete control of the decoration, believing

"the painted and sculptured decoration derives from and depends on the architectural composition ... the architect, to conserve the general harmony ... must impose on the artist not only the exact dimensions, but also the subjects, the silhouettes, the general tones, the effects and the style of the composition". Presumably he exercised similar control over the decoration of his other Opéra house, the small one at Monte Carlo which dates from 1878 and seats only 500. A top-lit foyer which serves both house and casino has a peristyle of red columns with gilded capitals, which supports an upper gallery above which the deep coves of the ceiling are covered with painted arabesques. Gold, bronze, yellow ochre and red are the predominant colours in the auditorium which has something of the character of the Rococo 18th-century German court theatres. Like them, it has a prominent royal box in the centre of the back wall, domed, crowned and garlanded. The rest of the decoration is similar to that in the Opéra, with broken pediments, arabesque pilaster strips, caryatids framing the doorways, and naked figures balancing precariously on the heavy cornice brackets. Painted allegorical scenes fill the vacant spaces on the ceiling, and above all hangs a gigantic chandelier. Edwin Sachs circumspectly appraised it as a "luxurious and highly decorated piece of work [constructed for] visitors on pleasure bent, and by habitués of the gambling saloons" (Sachs, 1897).

Biography

Jean-Louis Charles Garnier. Born in Paris, 6 November 1825, the son of a blacksmith. Studied at the École de Dessin, 1838; entered the architectural atelier of Jean-Arnould Léveil, 1840; moved to the atelier of Louis Hippolyte Lebas (1782–1867), 1840–42; enrolled at the Ecole des Beaux-Arts, 1842. Won the Grand Prix de Rome, 1848; studied in Italy and was a Pensionnaire, Académie de France, at the Villa Medici, Rome, 1849–53, where he met Gustave-Rudolphe Boulanger, Paul Baudry and Jules-Eugène Lenepveu; visited Greece and Turkey in the company of the writer Edmond About, 1852. Married Louise Bary, 1857; 3 sons. Active in Paris as an architect from 1854. Won the commission for the Paris Opéra, 1861. Held many government posts and appointed Inspecteur Général des Bâtiments Civils, 1877–96. Elected to the Institut de France, 1874; president of the Société Centrale des Architectes, 1889–91 and 1895–97; member, Commission des Monuments Historiques, 1895–98. Awarded Gold Medal, Royal Institute of British Architects, London, 1886. Contributed numerous articles to the *Moniteur Universel* during the 1860s. Died in Paris, 3 August 1898.

Selected Works

The Fonds Garnier, in the Bibliothèque de l'Opéra, Paris, contains all his surviving manuscripts, much private and official correspondence, numerous building reports, and many newspaper and journal articles. The remainder of his archive, including his architectural library, and watercolours and sketches executed on his travels, is in the Bibliothèque de l'Ecole des Beaux-Arts, Paris.

Interiors

Garnitures de Cheminée

The French term, *garniture de cheminée*, or mantel garniture, applies to any set of ornaments designed for the mantelshelf of a chimneypiece. Such ensembles first gained popularity in the latter part of the 17th century but they remained a common feature of fashionable interiors well into the 19th century. Traditionally, they comprised two, three, or five Chinese porcelain vases or beakers, generally of alternating baluster and cylindrical form. Later versions, however, increased both the number of pieces and the types of media employed. Different ceramics (principally Delftware), silver, ormolu, and hardstones such as blue-john became popular, and they occasionally featured candlesticks, perfume-burners, pot-pourri, vases,

and even clocks. A key feature of every example was their symmetry of design and disposition, and they provided a balanced and harmonious arrangement of ornaments that occupied a prominent position within the room.

The evolution of garnitures is closely bound up with the overall development of ceramics as a central element within the decoration of interiors. Indeed, their first wave of popularity during the late 17th century occurred when the mania for imported porcelain was at its height. During this period the collecting and display of exotic and costly Chinese and Japanese wares in particular became an extremely fashionable pastime, and porcelain was not only massed within interiors, but small rooms – known as china closets – were also designed specifically for collections of these wares. The royal house of Orange-Nassau, with its easy access to goods imported by the Dutch East India Company, is usually credited with spreading the craze for porcelain collecting, and wherever members of this family settled, impressively rich displays of export porcelains were installed. Queen Mary II introduced the fashion to England and, with the assistance of Daniel Marot, created some of the most elaborate installations of porcelains of the period.

The formal arrangement of precious objects on the walls of interiors was also an activity that had been adopted by Italian architects in the late 16th century. According to the historian Peter Thornton, this habit "conformed to the Renaissance sense of order that was already so strikingly embodied in the current Italian architecture" (Thornton, 1978). As this trend towards orderliness spread northward, so did the aesthetic of displayed ceramics. Certain distinct features of Baroque architecture such as pronounced overdoors, cornices, and mantelshelves conveniently served as ideal surfaces upon which to position porcelains. An inventory of the Stadtholder's residence of 1632 lists numerous precious objects mounted on various types of shelves. Similar arrangements were to be found in England as well where such displays were recognised as being Dutch in origin: the Earl and Countess of Arundel, for example, referred to their china closet as their "Dutch Pranketing Room".

Concurrent with the growing appeal of formal arrangements of precious and rare objects, was the increased flow of Oriental ceramics into Europe, and eventually America. Although a few isolated examples had appeared in Europe as early as the 14th century, it was not until the establishment of the Dutch (1597), English (1660) and French (1664) East India Companies, that a flourishing commercial trade in Oriental porcelains began to develop. This trade increased rapidly throughout the late 17th and 18th centuries, but was ultimately stemmed by changing tastes, a fall in the quality of imported goods, and the growth of competitive European porcelain manufacturers.

Most of the early Oriental wares exported to Europe were bowls and dishes, and by the mid-17th century these also included the accoutrements for tea and coffee drinking. Vases are mentioned for the first time in the Dutch East India Company's records in 1636 (Charleston, 1975). However, the fashion for grouping vases on mantels did not arise until the last third of the century when it first emerged in the Netherlands. Initially, mantel garnitures were "free combinations of types" (Cocks, 1989); they then evolved into the

five-, seven-, and even nine-piece sets made by the Chinese for the West. These goods were produced solely for export and the taste for garnitures as a type of decoration was a specifically European phenomenon; the only sets made by the Chinese for their own purposes were sacred ones designed for temples, and which included two vases, two candlesticks, and a perfume-burner.

Early sets of *garnitures de cheminée* mostly consisted of blue and white, *famille verte*, and *famille rose*, Chinese porcelains; armorial and pseudo-armorial pieces were also very popular and were specially ordered. By 1670, however, Europeans were making imitations in silver and Delftware (or *faïence* – tin-glazed earthenware) to meet the rapidly growing demand, and were decorating them in styles that corresponded to the changing whims and fashions of their clientele. Various Dutch and French factories produced huge quantities of ornamental ceramics, including mantel garnitures, that were modelled in Baroque forms and decorated with Baroque motifs. Strapwork and arabesque ornament were much-used, distinctively European decorations, and Western variations of Chinese patterns, collectively known as Chinoiserie, were also popular. The Meissen factory in Germany produced garnitures in porcelain with a variety of decoration as early as 1720, and the English factories at Chelsea and Bow followed suit in the 1750s. The Sèvres manufactory was also making garnitures by the mid 18th century, and some examples are known to have included wall sconces for hanging on either side of the fireplace *trumeau*. Perfume-burners and pot-pourri vases made an appearance towards the end of the century when they were featured in fashionable Neo-Classical interiors: Wedgwood, for example, producing several types of garnitures derived from ancient Greek and Roman vases.

Whatever the style or exact composition of garnitures, by the early 18th century they were widely considered to be basic decorative components within the fashionable interior, and were no longer simply discrete collectable items but formed part of the overall scheme of a room. Glazes and colours were co-ordinated with those of the wallcoverings and fabrics, and novel types of shelving units and consoles – some moveable, others part of the architectural structure – were developed. The confinement of porcelain displays to the perimeters of rooms corresponded to the contemporary practice of lining furniture against the walls. Tables and smaller items were moved too often to provide suitable display space, and even when furniture was moved permanently into the centre of rooms towards the end of the century, the emphasis on mantels and overdoors as the location for ceramics returned as the fashion for shelves and consoles waned.

Given that wealthy women were often important collectors of ceramics, up until c.1760 ornamental porcelains were often placed in rooms occupied chiefly by women. Thus the style of garnitures frequently followed the style of decoration adopted in those private apartments where women spent much of their time. The proliferation of Chinoiserie decoration on porcelains, for example, reflected the rage for bedrooms and dressing rooms or boudoirs designed in the Chinese style. This feminizing tendency began to reverse, however, during the third quarter of the 18th century and Wedgwood's use of more erudite subjects was more in keeping with the masculine flavour of Neo-Classical interiors by Robert Adam and his

contemporaries. These interiors were highly integrated and mantel garnitures were usually co-ordinated with architectural features and other decorative elements within these schemes. It was also deemed essential that a room's decoration be consonant with its function and location within the hierarchy of the house plan, and mantel garnitures that occupied a prominent position on the chimneypiece did much to advance this philosophy.

From the second half of the 18th century *garnitures de cheminée* also began to be produced in a greater variety of materials. Matthew Boulton's ormolu pieces were a popular choice for mantels, and blue-john was used extensively after 1743 when the first substantial deposit was mined near Castleton in England. Likewise, other hardstones and marble were conducive to turning and carving into the classical shapes then in vogue. Silver was also desirable, and was worked into more intricate designs than ceramics, but it tended to be used for decorations on tables than for mantelpieces. In France, gilt-bronze mantel clocks braced by a pair of candelabra began to supersede the traditional set of vases for the mantel.

To summarize, mantel garnitures were present in Northern European interiors from the late 17th to the early 19th centuries. Their increasing popularity conformed to that of export wares generally and they represented one among several methods of displaying porcelains within the interior. Whole rooms were devoted to such displays, and all types of shelving and consoles were designed to support individual and grouped pieces. Ornamental ceramics were placed not only on mantels, but also on the tops of cabinets, within fireplaces (during the summer months only), over doors, and under buffets, cabinets and tables. The excitement first generated by exquisite delicacy of Oriental porcelains gave rise to a new generation of ceramic decorations and forms, and the evolution of *garnitures de cheminée* parallels that of the early history of Western ornamental ceramics.

Gaudí, Antoni 1852–1926

Spanish architect and designer

Antoni Gaudí's unique approach to design is perhaps best summarized in his maxim that "Originality is the return to the origin." His work had an organic quality in which structure is the form, and form is structural. A eucalyptus tree which grew in front of his studio in Barcelona was his metaphor: the tree supports its branches, the branches its twigs, the twigs its leaves; the parts and the whole grow harmoniously with no need of external support. Whether designing building structures, ornamentation, ironwork or furniture, Gaudí's art was rich and varied. His work was the result of his interest in the origins of structure and resulted in works of functional sculpture.

Although best known for his unfinished church, Barcelona's Sagrada Família, Gaudí had an active career, with commissions covering a wide range of design projects. He was greatly influenced by the work of Eugène Viollet-le-Duc whose principle of "equilibrium" grew out of his extensive work in restoring and renovating Gothic buildings. Yet Gaudí's approach to structural integrity went beyond Gothic, which required buttresses to guarantee stability. Gaudí's masonry structures were self-sufficient. His formal vocabulary consisted of ruled surfaces of double curvatures such as paraboloids, hyperboloids and helicoids. He believed that nature's forms and structures were based on these same geometries and, therefore, they were realistic forms, not artificial abstractions. And coming from a long line of boilermakers, he was accustomed to transforming flat sheets of copper into curved and double curved forms.

In 1885 Gaudí received a commission to design the mansion of Don Eusebio Güell at 3–5 Calle del Conde del Asalto (almost opposite Picasso's studio at No. 8) in an old downtown section of Barcelona. Gaudí used marble throughout the interiors of the Güell mansion, including arcades of parabolic marble arches carried on round columns and ceilings of marble slabs carried by exposed iron beams. The rooms were ornamented by elaborate woodwork detailed in the Moorish tradition. Gaudí produced original, delicate metalwork and wrought-iron decoration, such as convex metal grills which looked like sails in the wind. The high central room, with its organ and minstrels' gallery, was the dominant feature of the house and rose to a blue-tiled parabolic-domed ceiling. He also designed some of the furniture for the bedroom, most notably a chaise-longue with twined metal legs, which reveals his liking for extravagant, curvilinear motifs. In reassessing the functional needs of a dressing table, he added a lower surface to be used for lacing shoes to his animated, asymmetrical piece.

Gaudí's relationship with Don Eusebio Güell was to prove fruitful, as the same client employed him on many subsequent projects. In 1887, Gaudí designed the gatehouse at Finca Güell in Avenida Pedralbes. The Dragon Gate displayed an inventive exploitation of various forms of metal, including woven wire fabric. Built in tensile, curvilinear forms, the gate was a semi-transparent organization of the delicate interwoven planes. Gaudí's first-hand metal-working experience (having worked in his father's coppersmith shop) provided a solid base for his experiments with metals. Gaudí also designed the stables at Finca Güell. Here, to face the cupola, he used broken tile as a

mosaic technique for the first time. This technique was to be exploited by Abstract Expressionists more than fifty years later.

Ceramic tilework was favored in many of Gaudí's projects. At the Parc Güell, in 1908, he decorated the playground's curving benches with bits and pieces of broken ceramic tile mosaics to resemble the waves of the sea. By this time Gaudí's work had developed into such highly warped surfaces that the use of the typical square Spanish tile would have been impossible. These abstract mosaics share a spirit of delight with the work of painters such as Paul Klee or Wassily Kandinsky. The Parc Güell project mainly consisted of landscape design, but included several small buildings and subsidiary construction. The built forms were not based on any historical style, but emulated slanting tree trunks whose actual shape resulted from the careful technical analysis of the forces involved. The Parc was a place of fantasy, filled with colonnades, porticos and grottoes of pre-cast concrete blocks made to look like natural stone rubble. The lock plates on the gates had grotesque personalities. By exaggerating the enormous nail heads and oversized keyholes, Gaudí created fantastic, gargoyle-like creatures.

In 1901 Gaudí received Barcelona's first annual Architectural Prize for the design of the Casa Calvet, an apartment house for the heirs of Pedro Martin Calvet, but the project is most memorable for its ironwork detailing and furniture. After the building was completed in 1899, he designed the popular Calvet chair for an office in the building. In this early example of "free-form" furniture, Gaudí sought to design a piece that would support a human body at rest. Anticipating concerns for ergonomically-correct chairs, the seat and back were designed to cradle the human body. Its animal-like composition was similar to contemporary Art Nouveau furniture, which imitated antelopes or insects. The chair's front legs were turned out like classical ballet's second position; the back legs were a sinuous reversed S-curve. The director's desk was a substantial and massive wooden piece, complimented by bric-a-brac shelving.

Gaudí's next major secular project was the renovation of the Casa Batlló in Barcelona in 1904–06. Gaudí altered the main rooms, creating bright, open spaces with the use of articulated stone members. The windows on the first floor showed extraordinary plasticity; the ovoid stone surrounds were detailed with slender bony columns. Fragments of blue and green glass in abstract patterns highlighted the upper windows. The interior doors were small, set in large hinged panels which could be opened for formal occasions or in order to move furniture. The wall and ceiling surfaces gave a look of total motion, like waves of the sea. Gaudí inverted expectations in the detailing of the staircase, placing wooden treads between ceramic risers and baseboards. Since the court was wider at its top, Gaudí arranged the ceramic tiles on the walls in a graduated color flow with the lightest-colored tiles at the bottom to illuminate the lower floors. Gaudí designed much of the home's furniture. Highly functional, his pieces reinforced the pattern of curves that characterized the interior.

Casa Milá was built in Barcelona for Rosario Segimón de Milá between 1906 and 1910. This apartment house occupies an obtuse-angled site, in contrast to the traditional urban grid. Gaudí's study and keen understanding of structure freed him to

design a highly individual work. The internal skeleton was built of widely separated piers which replaced the need for interior bearing partitions. As a result, Gaudí could place his walls anywhere and create rooms of any configuration. The resulting plan was highly original, with no right-angled corners; no two floors or apartments were the same. The main rooms flowed into one another, each one decorated with its own pattern of whirlpools and sand dunes on the plaster ceilings and shell-like forms on the doors and door trim. Gaudí repeatedly worked with the same group of tradesmen who, trained in his methods of design and construction, were able to achieve the free, spontaneous quality which made his work so special.

Although not widely exhibited, Gaudí's work was represented at the Paris Exhibition of 1878, at the Naval Exhibition of 1887 at Cadiz, and at the 1888 International Exhibition in Barcelona.

Gaudí continually experimented with materials, particularly ironwork. His fascination with the intrinsic character of metals and his complex and imaginative approach to decoration led him to find ways to curve wrought and cast iron on the fence at the Casa Vicens to make it appear like lively plants. Reinterpreting the Spanish tradition of *rejas* (grille-work), he gave the entrance gate at the Teresan School a spiky character. The iron door at Bellesguard looked like it was made of ribbons sewn together, and the lion of the city decorated the top of the door grille at the Casa Fernández-Andrés of León. Gaudí's work challenged the view to grasp the enormous possibilities of form and space, and materials and techniques.

Gaudí's talent was an intensely personal one. From his innovations in structure to his experiments with furniture, his voice stands out for its expressive and eccentric tone. His work is characterized by his preoccupation with organic form and his enthusiasm for surface texture. Gaudí was an artist of design, his approach resembling the impulses of painters and sculptors. Not surprisingly, his tile mosaics and metalwork have influenced artists outside of the design fields. Gaudí's body of work is a symphony, where each project, like each line of orchestration, is composed to be part of a greater whole, bringing a visual excitement to its environment.

Biography

Antoni Gaudí y Cornet. Born in Reus, near Tarragona, 25 June 1852. Studied architecture at the Escuela Provincial de Arquitectura, Barcelona, from 1873; graduated Dip. Arch., 1878. Worked with various architects in Barcelona, 1874–82; collaborated on electric street lighting project, 1878–80; practised as an independent architect in Barcelona from 1882. Withdrew from all secular commissions c.1915 to concentrate on the Sagrada Familia, Barcelona (1883–1926). Died in Barcelona following a road accident, 10 June 1926.

Selected Works

A catalogue raisonnée of Gaudí's designs and drawings, including a chronology of his life and work, appears in Collins 1983. Examples of Gaudí's architectural drawings, decorative designs and furniture are in the Gaudí Museum, Parc Güell, Barcelona.

Interiors

- 1878 Comillas Pantheon, Comillas, Santander (furniture)
- 1886–89 Palacio Güell, Barcelona (building, interiors and some furniture): Eusebio Güell
- 1898–1904 Casa Calvet, Barcelona (building, interiors and furnishings): Calvet family
- 1900–14 Parc Güell, Barcelona (design of the grounds, pavilions, and park furniture): Eusebio Güell
- 1902 Café Torino, Barcelona (interior decoration including relief panels)
- 1904–06 Casa Batlló, Barcelona (remodelling, interiors and furniture): José Batlló y Casanovas
- 1906–10 Casa Milá, Barcelona (building and interior decoration): Doña Rosario Segimón de Milá

Gehry, Frank O. 1929–

Canadian architect and furniture designer

Frank O. Gehry is one of the most innovative and highly regarded architects of the late 20th century. Initially renowned as an experimental architect of the spontaneous Californian school, he has gained international standing as a designer of several prestigious and exuberant cultural centres in the United

States, Europe and Japan. He approaches buildings as if they were sculptural objects, expressive, spatial containers; and he has described the manipulation of the interior as “an independent, sculptural problem and no less interesting than the design of the container itself.” His work is informed by a close association with contemporary American artists and sculptors which has helped to break down the historic divisions between art and architecture, and by his wish to escape the limitations of “the rectangular box”. His buildings and interiors, although fiercely expressive, are also the fruit of successful collaborations with client, partner or artist.

Gehry was born Ephraim Goldberg in Toronto, of Jewish parents. His father moved to California to sell pinball and slot machines in 1947. As a child Gehry had been fascinated by the materials of his grandfather's hardware store and at one period his father had a furniture company. Gehry also cites a lecture given by the Finnish architect, Alvar Aalto when Gehry was 16 as a formative memory. He studied architecture at the University of Southern California and attended the Harvard Graduate School of Design. After graduating he went to work with large commercial firms such as Victor Gruen who built shopping centres in Texas and William Pereira, responsible for Los Angeles Airport. In 1961 he worked in Paris but returned to Los Angeles to open his own office in 1962 which he runs today as the firm of Frank O. Gehry Associates.

The free spirit of the West Coast of America permeates his early works which are an improvised fusion of high- and low-tech and easy, haphazard collisions of shapes and materials. In the studio-house (1970–72), built for a friend, the painter Ron Davis, the interior, trapezoidal plan and elevations exaggerate the perspectival distortions of right-angled room spaces. The architect plays with the interior space in homage to the artist's experiments with perceived reality. The shed-cum-factory exterior of corrugated metal encloses a softer, wood-panelled interior with exposed beams, lofts and staircases. A warmth and freedom lends an air of informality to spatially ambiguous complexity.

The interior office space of the Mid-Atlantic Toyota Offices, Glen Burnie, Maryland (1978) breaks up the internal space into abstract shapes using inexpensive materials, perhaps reminiscent of Russian Constructivism. Chain-link fencing, which was to become a prominent feature of Gehry's later work, and sheetrock (plasterboard) walls form irregular spaces for workers, and skylights and carefully arranged divisions bring daylight to every part of the interior.

It is in his own house in Santa Monica that Gehry iconoclastically bonds semi-industrial ugliness with high art. Mixing hostility with domestic homeliness, the house is perhaps a metaphor for America itself. The house is built up around the shell of an existing 1920s California “dumb little house”. The pink walls are partly retained, yet deconstructed and surrounded by an encasement of corrugated metal, chain-link-fencing and raw plywood, materials normally associated with an industrial landscape or loose residential backyards. The interior emphasises a sense of the makeshift and unstructured by using unpainted, rough wooden walls, textures and surfaces. “I am not interested in finishing work,” Gehry has declared, “but am interested in the work's not appearing finished, with every hair in place, every piece of furniture in its spot, ready for photos. I prefer the sketch quality, the tenta-

tiveness, the messiness ... the appearance of in progress.” The dining room is a glazed extension of the original house which also remains a strong presence in the kitchen's south wall. Brick fireplaces are surrounded by raw plywood walls in the living room where a seating area is made from industrial felt-covered, foam-rubber cushions. The partially stripped walls of the second floor master bed-sitting room again reveal the original framework of the old house and the dialogue between outdoor and interior spaces continues with transparent walls, floors and ceilings creating unexpected views. The windows are large-scale to encourage space, light, comfort. They are also intended to dominate the supposed chaos. One corner-window stirred associations with Duchamp's *Nude Descending a Staircase* and Gehry tried to rotate the corner “so as one walks around it, the window would rotate.”

Symbolic (perhaps subliminal) natural forms, particularly fish- and snake-forms have also permeated Gehry's interiors and designs. They include *Fish Lamps* made from smashed shards of ColourCore, the Fishdance Restaurant in Japan in the form of a giant, semi-erect fish, and Snake Lights and serpentine staircases proliferate in his work. Gehry's *Easy Edges* series of abrasive, corrugated cardboard furniture, produced between 1969 and 1979, has also made a significant contribution to furniture design. Intended as the ultimate solution to the search for an inexpensive modern chair, the series included rockers, a high chair, and the *Wiggle* side chair. It not only gained critical acclaim but was also commercially successful; however, Gehry withdrew it from circulation because he did not want to be famous as a furniture maker. *Easy Edges* were reissued in 1982 at the request of the Bloomingdale's store. Gehry's next series, entitled *Experimental Edges* was also constructed out of cardboard, and despite its “punk” irreverence and political liberalism, aspired to the status of high art. There has been considerable cross-fertilisation between Gehry's architecture and his furniture designs and it has been noted that some of his buildings appear not only sculptural but also like large pieces of furniture. The Chapel at Loyola Law School, for example, is panelled in stained plywood and the Winton guest house of 1984–86 is clad in Kasota stone which Gehry wants to look like plywood. Here also he clusters his one-room units into village-like groups of buildings, a theme he returns to continually, especially in his private houses.

In Rebecca's Restaurant, Venice, California, Gehry creates a surreal flamboyance in a small, 60-seater restaurant populated by a menagerie of large crocodiles, an enormous glass, octopus-chandelier, fish lamps and leafless, wooden trees. The materials – glass, copper and onyx – are crafted and do not appear cheap or gaudy; the rich colours are predominantly white, orange and green.

“Why should buildings always be boxes? I suggest the use of objects as ‘found’ design, to construct colossal things as seriously as buildings are built.” So stated Gehry's friend, the sculptor Claes Oldenburg with whom he collaborated (together with Oldenburg's wife, Coosje van Bruggen) on the Chiat / Day advertising agency building. The exterior of this building comprises a complex of individual forms that also function as sculptures: a white boat, central, black binoculars and a red forest-form. Ironic and funky, fusing high and low

taste, the interiors of this 1980s media building are equally remarkable. There are three separate media rooms, each designed in contrasting materials of sheet metal, cardboard and dark red Finn plywood. The cardboard room has furniture in *Experimental Edges* style. The walls are surfaced in corrugated blocks of cardboard and a shaft of California light enters by means of an oculus, piercing the womb-like space. The room is zany and unorthodox yet it also functions perfectly as an acoustically silenced office and is ideal for this self-reverentially creative and unashamedly commercial environment. The lights are in the form of snakes or giant, pop-art-like bulbs, and the furniture is formed from rough tree-trunks; they serve as functional objects, as art and as sculpture.

A direction towards monumentality is realised in the Vitra Design Museum, Weil am Rhein, Germany, 1989 where Gehry's fascination with one-room buildings attains grandeur. The project was commissioned by Ralph Fehlbaum, director of the Vitra furniture company who wished to house his collection of industrially designed furniture in a purpose-built museum adjacent to his factory, shops and showroom and sculptures by Oldenburg and Coosje van Bruggen. The exterior is a disarming mixture of serpentine and angular architectural sculpture, contrasting sheet steel "like an old oil-can" with white, plastered surfaces. In contrast, the interior is breathtakingly calm. Light floods into the building from an ascendant, cruciform window in the glass roof. The central, two-storeyed exhibition space contains a play of openings and light sources against which the full, sculptural values of the chairs are enhanced and informally displayed. The serenity of this museum's church-like interior surely marks Gehry's long-standing love of Romanesque church architecture as well as Le Corbusier's Ronchamp chapel. A sanctuary is distilled from chaos.

In 1991 Gehry designed another highly individual furniture series for Knoll International which was produced from woven, maple strips. Three years of technical and artistic experimentation resulted in five chairs, two tables and an ottoman, named after ice hockey terms (Gehry's favourite sport), which were inspired by wooden crates and bushel baskets. *Hat Trick*, *Power Play*, *High Sticking*, each weigh perhaps no more than six pounds. They demonstrate Gehry's desire to create a chair where the seats and backs are no longer independent of the frame and no upholstery is required. Sculptural, distinctive, and experimental, the furniture, like his architecture, marries individualism with a sympathetic responsiveness to materials and user.

Gehry's most recent commissions have included further buildings for Vitra, the Walt Disney Concert Hall, the American Center, Paris, and the Euro-Disney Entertainment Center, Marne-la-Vallée. Currently in progress is the Guggenheim Museum, Bilbao, Spain where he is incorporating a road bridge and a high gallery space with catwalks that will provide views into the gallery and out over the city and the river. The building will use local materials and skills. This intention, like much of Gehry's work itself, appears to represent the finer aspects of American culture, generosity, humanitarianism, and freedom.

SUSAN HOYAL

Biography

Frank Owen Gehry. Born Ephraim Goldberg, in Toronto, 28 February 1929. Family moved to Los Angeles, 1947. Studied architecture at the University of Southern California, Los Angeles, 1949–51 and 1954; studied city planning at the Graduate School of Design, Harvard University, Cambridge, Massachusetts, 1956–57. Served in the United States Army, 1955–56. Married: 2 sons. Architectural designer, Victor Gruen Associates, Los Angeles, 1953–54; planner and designer, Robert and Company Architects, Atlanta, 1955–56; designer and planner, Hideo Sasaki Associates, Boston, 1957; architectural designer, Pereira and Luckman, Los Angeles, 1957–58; worked on planning, design and project direction, Victor Gruen Associates, 1958–61; project designer and planner, André Remondet, Paris, 1961. Principal, Frank O. Gehry Associates, Los Angeles since 1962. Designed interiors and exhibition layouts from the 1960s; produced furniture from 1969; involved in stage set design. Assistant Professor, University of Southern California, Los Angeles, 1972–73; visiting critic, University of California at Los Angeles, 1977 and 1979; Professor of Architecture, Yale University, New Haven, Connecticut, 1979 and 1982; Eliot Noyes Professor, Harvard University, 1982, 1985, 1987, 1988, 1989. Received numerous prizes and awards including the Pritzker Architecture Prize, 1989. Fellow: American Institute of Architects, 1974; American Academy and Institute of Arts and Letters, 1987; American Academy and Institute of Arts and Sciences, 1991.

Selected Works

For a full list of Gehry's architectural and design projects see Arnell and Bickford 1985. Examples of Gehry's furniture are in the Museum of Modern Art, New York, and the Vitra Design Museum, Weil am Rhein, Germany.

Interiors

- 1968 O'Neill Hay Barn, San Juan Capistrano, California (building and interiors)
- 1970–72 Ron Davis Studio and House, Malibu, California (building and interiors)
- 1974 Rouse Company Headquarters, Columbia, Maryland (building, interiors and fixtures)
- 1977 Berger, Berger, Kahn and Shafon, Law Offices, Los Angeles (interiors and furniture)
- 1978 Mid-Atlantic Toyota Offices, Glen Burnie, Maryland (office interiors)
- 1979–87 Frank O. Gehry House, Santa Monica, California (building, interiors, furniture and fittings)
- 1981–84 Law School Building, Loyola University, Los Angeles (building, and remodelling of library interior)
- 1982 Wosk Residence, Beverly Hills, California (building and interiors)
- 1983 Norton House, Venice, California (building and interiors)
- 1984–86 Rebecca's Restaurant, Venice, California (interiors, fittings and furniture)
- 1984–86 Winton Guest House, Wayzata, Minnesota (building and interiors)
- 1986 Schnabel Residence, Brentwood, California (building and interiors)
- 1986 Chiat / Day offices, Venice, California (building, interiors and furniture; with Claes Oldenburg and Coosje van Bruggen)
- 1986–89 Fishdance Restaurant, Kobe, Japan (building, interiors and furnishings)
- 1987–89 Vitra Design Museum, Weil am Rhein, Germany (building and interiors)
- 1988 Euro Disneyland Entertainment Center, Marne-la-Vallée, near Paris (building and interiors)
- 1989 Walt Disney Concert Hall, Los Angeles (building and interiors)

- 1990 University of Minnesota Art Museum, Minneapolis (building and interiors)
 1991 Guggenheim Museum, Bilbao, Spain (building and interiors)

Gehry's first furniture designs, for dayrooms at Fort Benning, Georgia, date from 1954. His celebrated corrugated cardboard furniture was produced between 1969 and 1973, and included the *Easy Edges* range of 1972 (reissued as *Rough Edges* in 1982). In 1991 he created a collection of furniture for Knoll International. Gehry's *Rykba* fish lamps, and his Snake lamps were produced by Formica in 1984.

George IV 1762–1830

British monarch, collector and patron

"I am hard at work upon my mansion at Carlton House ... I am adding and building considerably to it, and hope on yr. Return you will not think me a bad architect", wrote the young Prince of Wales to his brother in 1783. But the talents of the future King George IV lay in his skill in interior design.

That skill was exhibited principally in four sites: Carlton House, where he lived from about 1785 to the mid 1820s; the Royal Pavilion, Brighton (1780s–1826); Buckingham Palace, where rebuilding began in 1825; and at Windsor. Windsor Castle was made habitable by about 1828, but he was never able to live in the rebuilt Buckingham Palace. Thus it is in his princely residences, Carlton House and the Brighton Pavilion, that one is able to study the development of his taste, although the two kingly residences represent its culmination.

At first he employed Henry Holland as his architect. Carlton House was a confused congeries of old buildings to which Holland brought a sense of order and rationality; and the marine villa at Brighton was acquired as a mere holiday residence for the heir to the throne. The need to amend these inadequate structures to accommodate the princely household, and to find the best arrangement, called for frequent modifications; and the interior decorator's perpetual search for perfection that induced the patron to discard half-executed schemes, stamped the Prince as a man of fickle taste.

The prince was, however, consistently an admirer of French taste, as was Holland. In 1785 Horace Walpole recognised the French derivation of the ornamentation at Carlton House, striking in its "august simplicity", though this must have owed at least as much to Holland and his French craftsmen as to the Prince. But constant alterations were made in the interiors, the Prince experimenting with the juxtaposition of complementary colours in furnishings. He employed successive French decorators, first Guillaume Gaubert until about 1787 and then the *marchand-mercier* Dominique Daguerre, who furnished a Chinese Saloon designed by Holland in 1789, the first of a series of Chinoiserie essays.

Thus in 1805–07 a Chinese room at Carlton House (whether the original or another is unclear) was decorated at a cost of £1,375: the walls of carmine, with eight large figure panels; the doors black, with gold ornamentation; the ceiling, echoed by the carpet, with a lilac border, and central dragon on a green ground. Such schemes rarely survived long enough to be recorded visually: in May 1806 it was reported that "Although Carlton House as finished by Holland was in a complete & new state", the Prince had "ordered the whole to be done again under the direction of Walsh Porter who has destroyed all that Holland has done & is substituting a finishing in a most expensive & motley taste" (Farington Diary, 3 May 1806).

Just as the Prince's experiments with Chinoiserie at Carlton House paved the way for his Brighton Pavilion work, so similar experiments in Gothic – another exotic style employed at the time to arouse particular sensations – preceded the restoration at Windsor Castle referred to below. A cast-iron Gothic Conservatory with plaster fan-vaulting (inspired by Henry VII's Chapel, Westminster Abbey), the panels between

the vaulting ribs filled with coloured glass, designed by Thomas Hopper about 1807, has been perpetuated on paper, but a slightly earlier Gothic Library left no pictorial record. Among works carried out by John Nash in 1814 was a new Gothic Dining Room. These rooms enabled the Prince to indulge his fondness for armorial shields as a decorative feature, also found in stained glass added in 1817 to the skylight of the Grand Staircase, and subsequently widely used for Gothic ornament, as in the Houses of Parliament.

James Wyatt's structural alterations at Carlton House in 1804–05 gave scope for wholesale schemes of redecoration superintended by Walsh Porter, a connoisseur who strongly influenced the Prince. Magnificent textiles replaced mural painting, enabling the Prince's growing collection of easel paintings (mainly of the English and Netherlands schools) to play an integral role in the decoration. Drawing inspiration from ancient Rome, Porter achieved sumptuousness. Adjacent apartments were brought into harmony as in the two Blue Velvet Rooms, and in the *enfilade* of rooms on the basement floor garden front (continued after Porter's death in 1809) with scarlet curtains and furnishings ornamented in black velvet and scarlet-bordered yellow carpets. And Porter declared that "I have not added or branched out into a single thing that was not plan'd by the Prince himself (not me)" (Aspinall, *Corr. of Pr. of Wales*, no.2078).

The Prince's fastidious supervision is established by the number of models made both of parts of rooms and of furniture, and the submitting of numerous patterns for textiles, glass and flooring for his selection. A carpet for the Ballroom was made in 1792 "after a design given by his Royal Highness" (PRO, HO73/19). His enthusiasm for Sèvres porcelain was expressed in the introduction of quasi-permanent garnitures in his rooms, as well as displays of *déjeuners* and small items. Similarly he acquired ornamental pieces of gold (or silver-gilt) plate for permanent display, and, with his friend and adviser Lord Yarmouth (later 3rd Marquess of Hertford), was a keen collector of the then *démodé* Bouille furniture, actually ordering new pieces. Likewise, although he bought furniture in the fashion of the day, he snapped up French furniture of the finest quality in unfashionable earlier styles as far back as Louis XIV, whom he admired as a role model.

As an escape from Court life, the prince took a house at Brighton in 1786. Henry Holland quickly added a new north wing, linked to the existing south wing by a circular saloon, and introduced bow windows, adorned with Ionic *scagliola* columns. The prince's Gallic taste was commented on: the library, "fitted up in the French style", with a brilliant yellow paper; *scagliola* columns in the dining room, painted in yellow and maroon with a sky-blue ceiling. The saloon, with paintings by Biagio Rebecca was in Holland's Berrington style. About this time, the house began to be called the prince's "marine pavilion", a term borrowed from the Comte d'Artois's lately-built *pavillon de Bagatelle* in the Bois de Boulogne, Paris.

At Brighton, the Prince lived less formally than in his town palace; his house likewise was less inhibited. His long-standing interest in Chinoiserie found ample scope here. The gift of "a very beautiful Chinese paper" in 1802 is said (Brayley, *Her Majesty's Palace at Brighton*, 1838) to have decided him to employ it in constructing a Chinese gallery out of two of Holland's rooms, made redundant by new extensions, but this

may not have been the earliest Chinoiserie at the Pavilion. Seized with enthusiasm for the alterations, the Prince decided to decorate it wholly in the Chinese style; he told an intimate that he had chosen it "because at the time [during the French Revolution] there was such a cry against French things, etc. that he was afraid of his furniture being accused of jacobinism" (*Lord Granville Leveson Gower: private corr.*, 1916). Chinoiserie fittings and furnishings were brought from Carlton House, and new ones acquired. Chinese papers were hung in the principal rooms, "the Prince assisting in fixing up and cutting out the Birds, etc. on the paper in the Saloon" (Crace ledgers), bamboo panelling was effected in wood or in paper, lacquer cabinets and bamboo furniture installed, ornaments imported direct from China: a new, or at least a modified fashion in interior decoration. Many of the decorations painted by Crace are taken directly from Chinese porcelain or textiles, rather than from the Westernised tradition. In the sequel, ideas for creating a Chinese exterior also were abandoned in favour of the more substantial forms of Mughal architecture when John Nash reconstructed the building in 1814–21.

Nevertheless, the internal changes and the new rooms at the Pavilion were still Chinoiserie, though in a rather different style, and with Indian touches. Indeed, in retrospect, the period 1815–c.1819 appears as one of decorative experimentation. The Prince supervised the work closely, as the Crace ledgers show: thus in July and August 1815 he was attended by teams of assistants "putting in patterns" in the North and South Drawing Rooms, and ordering technical experiments and successive changes in colour; subsequently he arranged the hanging of papers; and in 1818 he himself sketched the bamboo and bows design for decorating the convex covering of the end walls of the Music Room. One of the most interesting experiments was the combining of decorative marbling, as practised at Carlton House, with Chinoiserie, but it was soon abandoned, to be followed into limbo by gay, colourful Rococo designs in the saloon and drawing rooms associated with the Craces' rival painter, Robert Jones.

Grandest of the interiors of this period were two new immense domed rooms, one for eating (largely Jones's designs), the other for music (principally decorated by the Craces), the most spectacular of George's works; and it is particularly with these that the final, more sumptuous style of decoration is associated. Princess Lieven, familiar with the Russian imperial palaces, commented: "I do not believe that, since the days of Heliogabalus, there has been such magnificence and such luxury" (quoted in Clifford Musgrave, *Regency Furniture*, 1966). Their remarkable ceilings were highly original in form, the music room's dome resting on a double coving above an octagon, that of the Banqueting room having a convex coving above a more conventional arrangement of spandrels, with a fantastic central chandelier (strictly, *gasolier*) ringed by lotus flowers upheld by dragons, and suspended from a dragon in the dome that cost £5,600. This opulence with its Mughal flavouring, was echoed in the redecoration of the lesser rooms, creating a measure of harmony throughout: scarlet and gold predominate, gold in profusion. Intricate carving, gilded or silvered, glittered in a hundred mirrors; porcelain in the richest mounts proliferated.

The Brighton Pavilion was a seaside amusement; as Regent

from 1811, with full powers from 1812, the Prince required residences of state. The increasing grandeur of Carlton House may be seen as responding to this need, but the building was too ramshackle structurally and too public – “in a street” – to serve permanently for a ruler made conscious of his unpopularity. St James’s Palace could still be used for state ceremonies, but his father had resided in Buckingham House (“The Queen’s Palace”) and Windsor Castle. The deaths of his mother and father, in 1819 and 1820 respectively, opened the possibility of reconstructing those palaces whenever the government would provide the means. In these two great undertakings of his reign, George IV reverted to his habitual francophilia, encouraged by a new artistic adviser, Sir Charles Long (later Lord Farnborough).

To make Windsor Castle a convenient modern residence, Long drew up a blueprint executed by Jeffry Wyattville; the young A.W.N. Pugin was employed to design appropriate furniture in the increasingly fashionable Gothic style. But the king’s French predilections were expressed in a Grand Reception Room in a revived, somewhat indeterminate retrospective style (miscalled “Louis XIV”), for which Long purchased 18th-century Rococo *boiseries* in Paris, while the semi-state apartments, with much material from Carlton House re-used, echoed that palace’s French tone. The younger Wyatts were employing a similar Louis style in York (later Sutherland, now Lancaster) House, London and Belvoir Castle, Leicestershire. Although the king took up residence in the castle in 1828, much still remained to do at his death.

In London, funds were found to start rebuilding the Queen’s Palace in 1824, a work entrusted to Nash. The king determined the character of the plan, and then, as work progressed, developed his ideas on the interior decoration. At first he had intended it simply as his town residence, but in 1826 decided that it would make an excellent state palace in which to hold his courts, so that the decoration was enriched, at an additional estimate by 1828 of £51,000, quite apart from sculpture, and impressive parquet floors in the French manner (only one of which, in the Bow Room, was ultimately installed). “Whenever I saw [the King]”, Nash recalled, “it generally happened that he ordered some alteration” (House of Commons, *Report on Buckingham Palace ...*, 1831). There was some attempt at economy by re-using chimneypieces and furnishings from Carlton House, from whence many of the decorative ideas derived: *scagliola* or marbling was employed very extensively both for walling and for columns and pilasters in bright colours (“Raspberry-coloured pillars without end”, complained a Whig socialite – *Creevey Papers*, ed. Maxwell, 1904). The proliferation of panels in high relief, though a development of Holland’s overdoors, was regarded by contemporaries as a new development in interior decoration. As at Brighton, the ceilings of the State Apartments formed a remarkable feature, with bold concave or convex covings, often with huge scrolled brackets supporting the rich central coffering, the sculptured friezes and profuse gilding of the ornaments creating an effect of the greatest magnificence. A contemporary journal observed: “It is, indeed, not easy to conceive anything more splendid”, describing them as “a style new in this country, partaking very much of the boldest style, in the Italian taste, of the 15th century” (*Fraser’s Magazine*, 1830). Uncompleted at his death, Buckingham Palace

displayed only the more substantial decorative features of George IV’s taste.

In an eclectic age, the patron was able to choose from a wide variety of styles, and to choose the instrument (architect, decorator, painter) most appropriate for his purpose. George IV employed a range of such men, but he ultimately determined the work they accomplished. Rooted firmly in late 18th century French classicism, his taste nevertheless embraced and enhanced the more exotic forms employed at the time, and he declined to observe a strict uniformity of style in furnishing his rooms, creating grand but harmonious interiors by a carefully considered combination of diverse elements.

Biography

George Augustus Frederick. Born in London, 12 August 1762, eldest son of George III. Married 1) Maria Fitzherbert, 1785 (marriage declared invalid); 2) Princess Caroline of Brunswick, 1795 (separated 1796; she died 1821); one daughter. Served as Regent when his father George III was declared permanently insane, from 1811. Succeeded to the throne, 1820. Died at Windsor, 26 June 1830.

George & Peto (Sir Ernest George 1839–1922 and Harold Ainsworth Peto 1854–1933)

British architects and interior designers; firm established 1876; became George and Yeates 1892

Ernest George was one of the most prolific and successful of late Victorian domestic architects. His town houses in Harrington and Collingham Gardens, Kensington, of the late 1880s, were described by Hermann Muthesius as “among the finest examples of domestic architecture to be seen in London”, and his country houses, which ranged in style from

George & Peto: sitting room, 9 Collingham Gardens, London, 1883–84

Queen Anne, Elizabethan, Jacobean and Tudor, to Neo-Georgian, were no less successful. Throughout his career, George was committed to architectural partnership, setting up his first practice with fellow Royal Academy student Thomas Vaughan in 1861. Their commissions included commercial, domestic and some ecclesiastical work, and various of their country houses, such as Rousdon, Devon (1872–76), rehearsed the Great Halls with a floor to ceiling hooded stone fireplace, minstrels' gallery and long manorial windows, that were to be a speciality of George's work in the 1880s and 1890s.

In 1876, after the early death of Vaughan, George entered into partnership with Harold Ainsworth Peto, fifth son of the celebrated public works and railway contractor, Sir Samuel Morton Peto. Trained in both building and architecture, Peto, according to George, was not a draughtsman, "but had all the feeling of an artist". His taste and business acumen, together with his interest in interior, furniture and later garden design, made a perfect contribution to the 19-year partnership which

was to be the most spectacularly successful period of George's career.

The strength of George & Peto's practice did not lie in the formation of a progressive doctrine such as the Arts and Crafts Movement, but in their emphasis upon high quality in materials and craftsmanship. George & Peto's interiors were invariably designed in an effort to create picturesque effects, to give the impression of a house lived in by many generations in which the charm of "olden days" was combined with modern conveniences, as at Poles, Hertfordshire (1890–92). Where appropriate, George designed furniture himself, much of it forming part of integrated schemes and built *in situ*, as at Rousdon and in the Morning Room at Glencot, Somerset (1887). Free-standing, individual pieces were never direct copies, but rather slightly simplified versions of existing pieces with which he was familiar drawn from sources ranging from the medieval period to the mid 18th century. Guy Dawber recalls that George "always impressed upon clients the impor-

tance of keeping to some uniform scheme of furniture design in keeping with the architecture of the house with which it was to be associated."

George & Peto's own designs for furniture show a high level of scholarship, historical expertise and structural integrity. They were both enthusiastic collectors of old furniture and *objets d'art*, as evidenced by the interiors of their own homes and their office at 18 Maddox Street, London. The interior decoration of George's house, Redroofs, Streatham Common (1887–88), was subservient to the superb collection of Renaissance furniture, pictures and tapestries. Peto specialised in Old English Oak, detailing his collections in *The Boke of lford* (1917). They purchased furniture and furnishings on behalf of clients and were prepared to combine genuine examples of early furniture and applied design with examples of contemporary craftsmanship, as at the Yellow House, London (1892), designed for Peto's friend, the furniture connoisseur Percy MacQuoid. At Osmaston Manor, Derbyshire (1886), the antique furniture and tapestries were supplied by Joseph Duveen, while the plasterwork was executed by Walter Smith.

The scope of the practice widened dramatically after 1876, with many commissions plainly coming through the Peto family's connections with the worlds of art, commerce and construction, notably the Peto Brothers' timely speculation in Harrington and Collingham Gardens, South Kensington, with which George & Peto confirmed their success as advanced domestic architects. Their superbly conceived designs, executed between 1880 and 1888, represent the extremist point of late Victorian individualism. The range of plain Queen Anne was extended to include something of the picturesque brio of the old Flemish and German town houses, sketched and painted by George on his frequent tours to Northern Europe. The interiors tended to eschew the orthodox upper-class house plan, in favour of greater variety. In all the houses the stairs are of oak, and there is much dark panelling contrasting with rich hooded stone chimneypieces, white ornamental strapwork, beamed or coffered ceilings and stamped leather or otherwise Aesthetic wall coverings. In style, George & Peto's varied and individual schemes borrowed from almost every school and epoch of the early Northern Renaissance; the decoration is most prodigal on the highly carved friezes and fireplace arches. Small panels of Holbeinesque painted glass are introduced for picturesque effect, and porches have mosaic floors in Dutch tradition. While the detailing responds to the Aesthetic Movement, with Jeffrey & Co. wallpapers designed by J.D. Sedding and Walter Crane, and tiles by De Morgan, the quality of workmanship in the panelling, door furniture, and the carving of the interior schemes, reflect George & Peto's concern for craftsmanship.

The interior of 37 Harrington Gardens was calculated to create a fine setting for Sir Walter Richard Cassel's collection of paintings, while No. 39 was built for the celebrated dramatist W.S. Gilbert. Here, a dramatic stepped gable surmounted by a ship prepared the visitor for an interior richly ornamented in a style with consistent with the Northern Renaissance character of the house. The porch, with its rich carving in high and low relief, with quaint little sculptured caryatids playing music, leads through an unpolished oak door into the vestibule. The latter, with its mosaic floor, oak panelled walls and fluted frieze, has a moulded rib plaster ceiling. The oak panelled hall

includes a characteristic floor-to-ceiling chimneypiece in carved stone, fronting a Dutch blue-tiled inglenook where Gilbert periodically hung his hams. In the hall window are panels of glass, painted by Lavers & Westlake, but unfortunately the stamped poppy paper by Jeffrey & Co. has been removed. Another whimsical feature is provided by mottoes above the ground floor doors; these included the saying "And those things do best please me, that fall preposterously" above the drawing room, and "All hope abandon ye who enter here" over the entrance to the dining room. The latter was originally decorated by Howard & Sons, and has a wooden overmantel, and a ceiling with small gilt-edged panels between beams which rest on merrily carved corbels. The drawing room, opening out into the garden, has a strapwork ceiling and hooded alabaster chimneypiece to the west, sculpted after the manner of the 16th century, rather like those of "the old French castles". The panelling is of rosewood. The boudoir is at half landing level, and affords a small plaster oriel projecting into the hall. On the first floor, the billiard room with white toned panelling below red surfaced walls (originally decorated by Howard & Sons) and Gilbert's oak panelled library-cum-study, which retains its corner fireplace, high panelling and gold-stamped leather paper (originally red and gold). The radiator grills were brass repoussé panels by J. Starkie Gardiner.

Special interest attaches to the interior of 9 Collingham Gardens, it being Harold Peto's original house. It is quite naturally one of the most individual buildings in the development. Built in 1883–84, it adopts the Jacobean style, which sets it apart from its neighbours, and the interior decoration and appointments more than adequately compensated for any lack of extravagance in the plan. There were "many good bits of German glass", introduced into the windows, and antique tiles and panels in the hearths. The hall has an angled hooded stone fireplace with ingenious early Renaissance style carving and Dutch tiles, the whole carried up to the low pitched oak ceiling. Original beams of timber made up the staircase arcade which has vigorous Jacobean detailing. The dining room has an attractive stone arched inglenook and the beams of the ceiling rest on carved corbels, one depicting a jester. The walls were originally covered with 16th-century stamped and gilded leather, above an oak dado. All the decorative ironwork was executed by Ellis and Rice. In 1889, Peto moved to 7 Collingham Gardens. During his occupancy the interior, remarkable for its rich, dark and heavy Jacobean detailing, historicist panelling and coffered ceilings, provided the perfect context for Peto's collection of *objets d'art*, and the furniture, in particular, revealed his love of Renaissance work. The lofty sitting room, occupying a storey and a half in height, in original warehouse / shop fashion, was especially luxurious, with old stained glass in the windows, a music gallery and antique tapestries above the panelling.

George & Peto's country house interiors varied according to the style of the house, but invariably involved a good deal of oak, with elaborate relief decoration with figure and scroll decorations, and stone fireplaces elaborately sculpted with Neo-Renaissance decoration. The interior decoration of Woolpits, Surrey (1885–88), for Sir Henry Doulton, employed terracotta. While this material lent itself well to patterned forms in chosen places, the work of George Tinworth, one of Doulton's leading craftsmen, pre-empted the banality of mere

repetition. He carved the panel over the entrance door in the porch, with "Abraham Receiving the Angel's Visit" and also a fine terracotta chimney breast over the inglenook, which included a panel with carvings, "suggestive of domestic employments and hospitality". In the dining room, George & Peto created a classical setting appropriate for Tinworth's bas-relief of *The Sons of Lydippe*, placed above the fireplace. By far the most impressive display of Doulton Ware was in the billiard room, where it was combined with "impasto" to rich effect.

In their designs for the principal rooms of Sir Andrew Barclay Walker's yacht, *Cuhona* (1882), George & Peto chose to ignore any maritime connotations, instead deliberately treating the yacht as just another domestic interior. The salon, 24 by 20 feet, was richly carved in dark oak, the panels above the dado line carved in wood and lacquered a dull gold, were separated by fluted and carved pilasters. The ceiling was painted by G.F. Malins. A rich curtain enabled the limited space to be divided – an arrangement often favoured by George & Peto to convert halls into more intimate areas – into a drawing and dining room. The side of the curtain facing the drawing room was maize brocade, the reverse, stamped velvet. A mirror, surmounting the fireplace, was another device to extend the limited space. The sideboard, piano, writing tables, chairs and even the wine glasses were all specially designed by George & Peto to accord with the scheme. The sofas were covered with antique Persian rugs. The state rooms were all treated differently, the Ladies' Room had walnut dados with cretonnes above, while the other rooms were panelled to the ceiling. The boudoir, considered to be the "most perfectly finished of any part of the boat" had a rosewood dado, surmounted by hangings of *velours cisele* in pale terracotta and maize. The ornaments here were all old carved ivory figures, Netsuke and old coloured oriental porcelain. The panelling and cabinet work for these aesthetic interiors were from the shops of Messrs T. Lawrence & Sons.

Peto retired from the practice to concentrate on landscape gardening and interior design in 1892 and in the same year George entered into his final partnership with Alfred Bowman Yeates. George and Yeates designed Jacobean and Elizabethan interiors for North Mymms, Hertfordshire and in 1891–93, they undertook the alterations and refurbishment of West Dean Park, Sussex. Here the Great Hall was a comfortably furnished area, overlooked by an oak balustraded bedroom corridor. Other large country house commissions followed: Crathorne Hall, Yorkshire (1903–06), Eynsham Hall, Oxfordshire (1904–08) and Putterbridge Bury, Hertfordshire (1889–91). All included a great deal of oak panelling and characteristic carving, although more sober in feel. Their series of interior schemes in London included the design of the public apartments on the ground floor of Claridge's Hotel (1894–98). The hotel's smoking room was timber-beamed, with a lofty stone chimney piece, half-panelled walls and an intricate light fixture; the billiard room had an elaborate frieze. The ladies drawing room, with its deep white ceiling and fireplace, created a fresh airy atmosphere and was reminiscent of their highly successful Flemish Renaissance work of the 1880s.

HILARY J. GRAINGER

Selected Works

A large collection of George and Peto's drawings is in the Drawings Collection, Royal Institute of British Architects, London.

Interiors

- 1881–82 35 & 37 Harrington Gardens, London (buildings and interiors): Walter Richard Cassel
- 1882–83 39 & 41 (formerly 19 & 20) Harrington Gardens, London (buildings and interiors): W.S. Gilbert
- 1882–83 *Cuhona* yacht (interiors, furnishings and fittings): Sir Andrew Barclay Walker
- 1883–84 9 Collingham Gardens, London (building and interiors): Harold A. Peto
- 1885 7 Collingham Gardens, London (building and interiors): W.H. Peto
- 1885–88 Woolpits, Peaslake Road, Ewhurst, Surrey (building and interiors): Henry Doulton
- 1886 Osmaston Manor, Derbyshire (restoration and furnishings): Sir Andrew Barclay Walker
- 1887 Glencot, Wells, Somerset (building and interiors): William Sampson Hodgkinson
- 1887–88 Redroofs, Streatham Common, London (building and interiors): Ernest George
- 1889–90 6 Carlton House Terrace, London (alterations and redecoration): C.H. Stanford
- 1889–91 Shiplake Court, Henley-on-Thames, Oxfordshire (building and interiors)
- 1890–92 Poles, Ware, Hertfordshire (building and interiors): Edmund Smith Hanbury
- 1891–93 West Dean Park, Singleton, near Chichester, Sussex (additions, alterations and redecoration by George and Yeates): William Dodge James
- 1892 The Yellow House, Palace Court, London (building and interiors): Percy MacQuoid
- 1897 Claridge's Hotel, London (interiors including the ground floor public apartments and the principal staircase)
- 1904–08 Eynsham Hall, Witney, Oxfordshire (building and interiors): James Francis Mason
- 1908–11 Putterbridge Bury, Lilley, Hertfordshire (building and interiors): T.M. Clutterbuck

Germany

Two points play an important role in the consideration of German architecture and interior design. First, from AD 899 to 1805, the "Holy Roman Empire of the German Nation" embraced a total of over 300 autonomous *Länder* (territories) and cities. So, for this reason the following account is not limited geographically to the region occupied by Germany at the end of the 20th century. Second, during World War II a great many works of art, and in particular a great many of the most significant interiors, were destroyed. Thus our knowledge of German decoration and design must often be based on descriptions and illustrations of examples that no longer exist.

Little is known about German interior decoration of the Early Middle Ages. The earliest surviving documentary evidence dates from around 1200 and consists chiefly of allusions in epic literary texts produced at the German courts. These contained descriptions of imaginary fortified castles and *Pfalzen* or Imperial palaces, referring to chapels and shared living spaces as well as larger halls for special festivities and private chambers (*Kemenaten*). Walls of castle interiors were often hung with carpets or textiles or decorated with murals, usually depicting subjects from mythology, history, or courtly poetry. Particularly important were the large fireplaces and splendid candelabra, of which only a few ecclesiastical examples survive, including those in Aachen and Hildesheim cathedrals. The focal point of an interior would be a bed, used for sitting and reclining as well as for sleeping. Contemporary literature invariably describes them as richly decorated and very comfortable, qualities also evoked in the miniature showing Solomon's bed that decorates the late-12th-century manuscript of Herrad von Landsberg's *Hortus deliciarum*.

Few secular decorative objects or pieces of furniture are known from the High Middle Ages. The Neuburg in Unstrut, one of the seats of the Landgraf of Thuringia, and the residence of the Babenbergs at Klosterneuburg, both dating to around 1200, have, for example, retained part of their architectural decoration, and the Kaiserpfalz at Gelnhausen still has a fireplace mantel with elaborate wickerwork patterning. Representative examples of simpler interior decoration are to be found in Burghausen – a dining room that could be heated, a ground floor hall (1250–1300) and, in Babenhausen, a 13th-century Romanesque ground floor hall. Early 13th-century wall paintings depicting the Quest for the Holy Grail are to be found at Burg Rodeneck near Brixen.

Textiles were generally imported from Sicily, Byzantium, or Persia, as shown by cloths used to wrap relics that have survived in the Servatius Treasury in Siegburg. Although woven textiles were produced in Germany by the 13th century, embroidered cloths and knotted carpets were more likely to be used to decorate residential quarters, mostly produced at courts, monasteries, and in convents. Three carpets from 1300–30 with scenes of the Tristan legend have survived in the monastery of the Dukes of Braunschweig at Wienhausen near Celle, while wall-coverings with 22 scenes from the Tristan legend can be found in London's Victoria and Albert Museum, made in Lower Saxony in 1350–1400.

Monasteries and convents on the Lüneberger Heide still possess an extensive collection of Early Gothic furniture. In addition to the usual fixed cupboards, there are many exam-

ples of the type of dowry chest presented to a convent by a nun on her arrival, used not only as containers but also as seats and beds. Initially simple in design and decoration, their front panels became increasingly elaborate, attesting to the wealth of the owner. Cupboards, portable tables, and simple forms of seating were also to be found in late medieval monasteries and convents, while folding chairs became more common during the course of the 14th century.

Important political changes in the mid-13th century affected interior decoration. As the German emperor's influence declined, cities took over from the court as the sources of power and supporters of the arts. The *bund van der düdeschen hanse*, a closed association of approximately 200 cities pledged to mutually supportive trading arrangements, established in 1358, ensured a marked improvement in the economy and increased political self-confidence. Nonetheless, it was the fortified castles that first adopted the formal language of Gothic architecture. Aspects of vaulting, the decorative use of tracery, and particular forms of columns and capitals were transferred from the ecclesiastical sphere for incorporation into secular architecture, examples of which can be found in many fortified castles along the Rhine. The knights of the *Deutscher Orden*, who effectively mediated in German political life between the emperor, the trading cities, and the church, also drew on this style of building for their fortified castles: Marienburg, East Prussia (1339–1407, by Conrad von Jungingen), or Burg Allenstein.

New architectural forms also appeared in some public buildings erected by the newly enriched cities, for example the *Fürstensaal* in the town hall at Breslau (1350–late 1400s). Also notable in this respect were the assembly rooms and ceremonial halls used by the guilds of merchants and craftsmen. Great emphasis was placed on the interior decoration, which often incorporated typical Gothic decorative devices such as crockets or tracery. The town hall of Lüneberg, a city grown rich on the salt trade, is an outstanding example: the council chamber, completed in 1320, had glass windows and richly painted decoration, and its walls were later panelled. The collection of silver was housed in cupboards decorated with tracery; every rich German city possessed such a collection, which it used as a status symbol to prove its investment capabilities and to demonstrate its silversmiths' skills. The *Fürstensaal* in the town hall of the free imperial city of Goslar, renowned for its mining industry, retains the painted decoration it received in about 1520 as well as two candelabra made by the sculptor Hans Witten in about 1500 and fixed benches for the use of councillors. The *Hansasaal*, Cologne's town hall, has its principal wall richly decorated with figures and ornaments and showing the "Nine Heroes" (1349). The south of Germany also has many sumptuously appointed town halls, including Zug, with its decoratively carved hall of 1507–09.

In the houses of the emerging middle class there seems initially to have been little in the way of architectural decoration, and all that has survived are structural elements and some foundation walls. Such houses were half-timbered (the oldest surviving example is the 14th-century assembly house in Quedlinburg), sometimes with a basement floor in stone or, particularly in north Germany, of red brick. In the 14th century these styles gave rise to a distinct type of middle-class German house, featuring a large, usually two-storey, entrance

hall, with several separate rooms and a stone side wing or annexe, which initially housed individual quarters and provided a fire escape. Storage space was provided under the roof and there were stables in the yard. During the 15th century rooms tended to acquire distinct functions. The living room, a feature first found in south Germany, was also adopted in the north. Increasingly, the entrance hall developed into a reception area.

From the 14th century rooms were often panelled and, in south Germany, frequently heated by a stove covered with clay tiles worked in relief or decorated with figures; this feature spread to central and north Germany in the mid-15th century. Late medieval furniture, in particular chests and cupboards, was increasingly elaborately carved. Apart from its painted decoration, which has often not survived, the furniture of the late 15th century is distinguished by wavy and X-shaped ornamentation, seemingly in an attempt to soften the strict geometrical forms of High Gothic. Of particular interest is the Dürer cupboard in the Wartburg, the front of which is decorated with carved reliefs after woodcuts by Albrecht Dürer. The leading German craftsmen of this period were famous in their own right, for example Jörg Syrlin the Elder, who carved the high altar in Ulm Cathedral.

Medieval household utensils were generally of wood or clay. From the 13th century, Siegburg and the southern part of Lower Saxony were centres of stoneware production, while from the 15th century implements made of tin were more commonly found in wealthier households. Nuremberg and Silesia were the main centres of production. The use of bronze casting in the production of candelabra and ewers for washing the hands is known from the High Middle Ages. This process was subsequently used for door-knockers and circular candelabra. Bowls were mostly embossed and decorated with low relief work. Wrought iron was used for decorative additions to doors such as lanterns or gratings, and windows were seldom glazed. From the 14th century, drinking glasses came from Bohemia, the southern part of Lower Saxony, or Italy, and mirrors from Lübeck. Leather was used for containers or binding. Unique to the Middle Ages were beautifully-worked caskets that were both functional and works of art.

From the political point of view, the Middle Ages in Germany may be said to have ended with the death of the Emperor Maximilian I (reigned 1493–1519), known as “the last knight”. The accession of his grandson, who became Charles V (reigned 1519–56) heralded a new era. Leading German artists were Albrecht Dürer (1471–1528), Albrecht Altdorfer (c.1480–1538), and Hans Burgkmair (1473–1531), all from the south of Germany, signalling a shift in the 16th century in the location of the most important German art centres. The south, enriched through the work of its craftsmen and trade, became increasingly important, with special emphasis on Nuremberg, Augsburg, and Regensburg. Through the wide-ranging and profitable activities of the trading house of Fugger and the Welser bank, some of the middle classes achieved a power and wealth that outshone that of many princes. An increase in trade with Italy and Spain established connections which led to German artists undertaking journeys to Italy. The fall of the House of Burgundy, which had previously influenced matters of taste at the German courts, also prompted a degree of aesthetic reorientation, resulting in a new

language of form and new types of ornamentation. At first, the basic shapes evolved during the Middle Ages for everyday objects and for furniture were often retained and were merely decorated in a new style. Later, bolder changes included more attention to surfaces, while geometric pattern gave way to classicizing arabesques or floral motifs, formal qualities which first emerged in the products of goldsmiths, leather embossers, and cloth makers.

New designs were disseminated through printed books and sheets, most strikingly in the case of table centrepieces, or drinking vessels in the shape of coconuts, elaborate shells, and horns in gold or silver. A new generation of artist-engravers emerged: Albrecht Altdorfer and Hans Brosamer designed various objects for goldsmiths.

In the realm of cabinet-making, the most important designs included those devised by the Viennese court cabinet-maker Augustin Hirschvogel (1503–53). This culminated in the emergence of *deutsches Rollwerk* and the arabesque. The first books of patterns for textiles and embroidery also appeared at this time, published by Peter Quentel of Cologne, Jörg Gastel of Leipzig and, in 1534, Johann Schwarzenberger and Heinrich Steyner of Augsburg.

With the decline of the Hansa cities in the 16th century, the wealth of some parts of north Germany was redistributed and agriculturally rich areas prospered. After the end of the Schmalkaldian War (1547) and other religiously motivated disputes, a general improvement set in, partly encouraged by the arrival of gold from Central and South America. The fortified castle was no longer central to architectural developments, but was replaced by the *Schloss* (palace) whose principal function was residential rather than defensive. Many Renaissance palaces afford a good survey of the architecture of this period, among them Heidelberg, Stuttgart, and Mainz, but few have complete interiors. Most palaces retain only the built-in elements – fireplaces, door lintels, and ceilings – since most of their furniture was destroyed during the Thirty Years’ War (1618–48).

The German Renaissance was initiated by the Italian Renaissance from which it repeatedly borrowed and adapted, without ever attaining the grandeur of its model. Around 1600, however, there was a marked increase in artistic influence from Flanders and Holland. There, in the circle of the artists Hans Vredeman de Vries (1527–1606?) and Cornelis Floris (1513–75), a new style emerged which Germany adopted and which was popularized by architects such as E. van der Neer. Its ornamental decoration embraced elements of the grotesque and the fantastical, often recalling the appearance of rocks, hence the term *Knorpelstil* (literally “cartilage style”), and often combined with metal mounts and *Rollwerk*. The purest adaptation is to be found in the 1593 *Architectura* by Wendel Dietterlin (c.1550–99), followed by the *Architectura Civilis* of 1628 and *Architectura Privata* of 1641 by Josef Furttenbach, which are typical products of the Mannerist style.

A particularly versatile exponent of the German Renaissance was the Dutch painter, decorator, and architect Friedrich Sustris (c.1540–99). Trained under Giorgio Vasari in Florence, he was commissioned by Hans Fugger in 1568 to decorate a series of rooms in the latter’s Augsburg residence. He worked for the dukes of Bavaria at Burg Trausnitz near

Germany: Green Lacquered Room, Residenz, Würzburg, 18th century

Landshut and finally in Munich, where he supplied designs for sculpture, stucco work, decorations for court festivities, and even architectural plans. His masterpiece is the Munich Jesuit church of St. Michael.

A number of south German palaces contain particularly rich interiors, the most notable of which is at Landshut (1534–46) which was the first pure Renaissance palace to be built in Germany. A strong Italian influence is detectable in the severely architectonic arrangement of the Italian chamber and the barrel-vaulted hall and, in particular, the wall articulated with bands of coloured stone. Equally impressive is the Festsaal in the Fugger palace at Kirchheim an der Mindel, with carved ceiling and doors by Wenzel Dittrich (1585) and figures decorating the fireplace and niches (1582–85) by Hubert Gerhard and Carlo Pallego.

North Germany was influenced more by Holland than by Italy. The concentration of many splendid buildings along and near the River Weser gave rise to the term “Weser Renaissance”, although this style was to be found also in Westphalia, on the Baltic coast, in Hesse, and in Brandenburg. Exceptionally rich in figurative decoration, it is at its most impressive when used for memorials and tombstones. Secular examples include the Goldener Saal in Schloss Bückeburg, where the court sculptors Ebert the Younger and Hans Wolff carved the Götterpforte in 1605, drawing on the Mannerist style of Dietterlin. At Schloss Wilhelmsburg in Schmalkalden (1585–89), where the interior decoration was carried out by, among others, the Dutch court sculptor Wilhelm Vernucken, the influence of Floris and Vredeman de Vries is detectable in both the painted and sculptural elements. In the Weisser Saal there is stucco work, and carpets once hung on the walls; in the Riesensaal there were *trompe-l'oeil* caryatids and biblical and mythological scenes. The coffered ceiling of the banqueting hall is inset with 90 paintings on canvas by J. vom Hoffe. The painted decoration of the window recesses is by Van der Borch, who was close to the Dutch circle. Books of Dutch motifs remained a significant source of design until the late 17th century.

Renaissance staircases continued to draw on traditional Gothic forms. Beginning with the late Gothic spiral staircase in the Frauenhaus in Strasbourg, the development led by way of the model of the Château of Blois, to the Wendelstien (spiral stones) of Schloss Hartenfels in Trogau which was built by C. Krebs in 1533–36.

Unlike its French equivalents, German Renaissance furniture retained a number of Gothic forms. Through the use of pillars, gables, and coffering, these relatively simple objects received an architectonic stamp, while a variety of wood inlays enriched their surfaces. Cabinets were designed to contain a particular collection of curious, rare, or valuable objects, with smaller cabinets made for private individuals and larger, grander ones for use at court. Examples of these are the Prussian cabinet now in the Kunstgewerbemuseum, Berlin, and the cabinet made in Augsburg in 1625–32 for King Gustavus II Adolphus of Sweden.

In the ornamentation of stucco ceilings and carvings, Knörpelwerk and Rollwerk endured into the 1670s and 1680s. However, the true German Renaissance may be said to have come to an end in the Goldener Saal of Augsburg's town hall, decorated by Elias Holl and Mathias Kager. With its gilt

coffered ceiling, niches with figures, and rich architectural decoration, it draws on Venetian models and anticipated the splendour of the Baroque.

The Thirty Years' War (1618–48), during which large parts of south Germany and Brandenburg were laid waste, marks a definitive caesura in German history and the history of its art. The style of the Baroque era in Europe was determined by Calvinist Holland (which had become rich through the war and expanding worldwide trade) and by Catholic, Counter-Reformation Rome. In 1650, looking for a new orientation, Germany drew on the examples of Holland and Italy as it had during the Renaissance and adopted the modern style of the Baroque.

Germany's most significant connections with Holland and Italy were largely dynastic or political. The Governor of the Netherlands came from Hesse Nassau; in 1646 Luise Henriette of Orange married the Grosse Kurfürst Friedrich Wilhelm of Brandenburg, while her sister Henriette Katharina (1637–1707) became the wife of Johann Georg II, Prince of Anhalt-Dessau. All three commissioned important palaces: respectively, Schloss Oranienstein near Diez (1672–84), enlarged by Daniel Marot in 1696–1709; Schloss Oranienburg to the north of Berlin (built by J.G. Memhardt and M.M. Smidts in 1651, enlarged by J.A. Nehring from 1688), and Oranienbaum near Dessau (built by Ryckwaerts in 1688–98). Oranienstein retains splendid stucco work and a ceiling painting by Jan van Dyck. Oranienbaum still has a number of pieces of contemporary decoration, such as a Dutch leather wallcovering, from the Dessau Stadtschloss of 1661, a Brussels wall carpet after a design by Peter Paul Rubens made in the workshop of Franz van der Hecke, and a basement room of c.1690 decorated with Dutch tiles. Oranienburg has unfortunately lost all its original fittings. A fine ceiling painting and tiled dining room of this period is to be found in the royal Schloss Caputh near Potsdam, built in 1673 by Philipp de Chièze.

The first phase of German Baroque, lasting to around 1715, reveals strong Italian-Dutch influences and at the Berlin court a number of decorators were working in the classically imbued style. Johann Arnold Nehring (1659–95) was not only active in building work carried out at the Schloss at Potsdam but also designed, together with the artist Eggers, the Alabastersaal, notable for its clear articulation, a decorative cycle on the theme of the Kurfürst for the Residenz in Berlin, and a chapel for Schloss Köpenick. Dutch influence is even more clearly detectable in a number of tiled rooms, such as those in Schloss Hünefeld near Osnabrück, or in the Amalienburg in Munich (Cuvillies, 1725). Many examples survive showing the use of Dutch leather wall coverings, as at Hünefeld or in the monastery Zur Ehre Gottes in Wolfenbüttel. Carpets made in Brussels were widely popular, as they had been during the Renaissance, and in 1688 a German carpet factory was established in Berlin by Philip Mercier.

Italian influences can be seen in the Residenz commissioned by King Wilhelm I's grandfather, Duke Ernst August of Hanover who in 1685 had travelled in the Veneto. Leading Italian artists were employed. The gallery and orangery built in 1694–1700 in Herrenhausen has painted decoration by T. Giusti and D. Grana. In 1670 the Venetian Lorenzo Bedogni

took over the decoration, followed by G. Arighini and the stucco master G.B. Tornelli.

Ten years earlier the Kurfürstin Henriette Adelaide of Bavaria, a native of Turin, had commissioned Agostino Barelli to build the palace of Nymphenburg outside Munich as a suburban villa. Italian architects received many such commissions in Germany for some years after this. Enrico Zuccalli (1642–1724) from Ticino, who provided the designs for many palaces, and in particular for the Baroque interiors of Schloss Lustheim near Schleissheim and for Der Favorite, assumed control of the building work at Nymphenburg in 1673. In a further phase of building, starting in 1701, under the direction of Zuccalli and A. Vascardi, the palace was enlarged and partly redecorated following the example of Dutch palaces such as Het Loo, Rijswijk. For the large hall, Johann Anton Gumpf painted scenes from the life of Diana, Goddess of the Hunt, with stucco decoration by the Milanese F.A. Appiani.

While the strict classical architecture of building styles and furniture design followed the Dutch early Baroque, stucco work and painted decoration was usually executed with reference to Italian models. Stucco work was notable for its sculptural and symmetrical forms, with figures and fruit frequently worked in the round and sometimes coloured. Ceiling paintings made up of several individual canvases were set into the stucco; only rarely were they painted in fresco. This was the great age of German Baroque, and the leading architects responsible for interiors included Johann Friedrich Nette (1672–1714), who worked at the Ludwigsburg in Würtemberg and in the palaces of Anhalt, together with Schlüter and the stucco master Giovanni Simonetti (1652–1716).

Around 1700 the first celebrated German fresco painters and stucco masters emerged, most either from south Germany or from the north of Italy. In accordance with traditional guild practices, craftsmen and architects tended to come from the same family and during the 17th and 18th centuries a number of families simultaneously provided stucco masters, painters, and architects, in some cases working together on the same commission.

While wooden ceilings and, to some extent, wooden walls had been painted during the Renaissance, in the Baroque era such painted decoration was incorporated into thematic programmes to which both stucco masters and painters contributed. Initially paintings were executed on canvas and inset into the ceiling. While a room in Schloss Lustheim at Schleissheim, decorated under the direction of Zuccalli, was already entirely painted in fresco in the 1680s, the high point occurred in the 18th century. Such schemes created a compelling illusion or appeared to attempt to defy architectural space. The first such ceiling painting in a German palace was executed by Vittorio Andrea Aloisius in 1656–57 at Schloss Iburg.

The 700-square-metre fresco cycle of 1751–53 by Giambattista and Giandomenico Tiepolo that decorates the grand staircase of the Residenz at Würzburg is something of an exception. Alongside the usual allegories of the Four Seasons, and mythological, historical and religious scenes, there is also an apotheosis of the prince-bishop who commissioned the work. Similar features can be found at Pommersfelden and in the Herrenhaus at Hasselberg near Altenkrempe, which has a

Glorification of Count von Dernath by J.G. Simola, of about 1710. These celebrations of absolute power were derived from the notion of the state expounded by the French king Louis XIV. Initially, the example of the French court at the Château of Versailles impressed German rulers less for its architectural and decorative style than for the symbolism embodied in the *enfilade* system of interiors, and the use of allegories of Mars, Apollo, and Diana which embodied the idea of the ruler as the centre of the state.

The German Empire consisted of numerous small principalities, and the minor princes were keen to have their own status immortalized by artists and architects. In 1694 Duke Anton Ulrich of Braunschweig, ruler of some 200,000 subjects, commissioned the building of Schloss Salzdahlum from the architects Lauterbach and Hermann Korb, the theatre painter J.O. Harms, and various Italian stucco masters. It proved to be the largest German palace erected during the 17th century, and, as if taking a cue from the palace theatre (for which the duke himself wrote plays), illusion was intended to replace reality. Virtually everything was made of timber, even the apparent marble being merely stained wood. Nonetheless, there were also examples where the use of authentic materials was insisted upon. The court at Hanover commissioned solid silver furniture from the renowned Augsburg silversmith family of Biller, who also published engravings. A gilt display buffet made for the Grosse Kurfürst for use in the Stadtschloss in Berlin, was intended to highlight the wealth and power of its owner and in times of hardship might be used as a reserve fund, as were many gold dinner services.

The advent of German High Baroque dates from around 1715 and is comparable to the French Régence. Eschewing Italian-Dutch influences, German art demonstrated a new readiness to follow French examples, and an important conduit was the work of Paris-trained Joseph Effner (1687–1745), who was involved in the building of the Munich Nymphenburg and who was to influence Bavarian architecture for several decades. In place of the strongly plastic elements of the Italian approach to decoration, Effner used the shallow ornamental ribbons or strips of the strapwork style, *Bandelwerkstil*. The decoration of the northern antechamber in the main Nymphenburg building was executed by the Paris-trained court cabinet-maker J.A. Pichler in strap- and lattice work, interspersed with victory trophies and symbols of the Arts. Simultaneously, work on the stucco reliefs of the copesones of the windows (1726) was being executed by the Parisian sculptor Charles Dubut, by G. de Grof from Antwerp, and by the Italian Giuseppe Volpini.

It was in architecture, rather than in interior decoration, that the French made the greatest impact. Richer and more elegant interiors contrasted with the heavy style of the Baroque as French architects and decorators became involved in German projects. German architects, meanwhile, reciprocated by travelling to France. The palaces initiated by the Schönborn family in Würzburg, Pommersfelden, and Mainz (Der Favorite, 1700–24), all drew heavily on the classicism of French Baroque in a style that is architectural rather than relating to the decorative arts.

French Rococo was adopted in Germany around 1735–40 and was strongly influenced by the engravings of Jacques de Lajoüe, Nicolas Pineau (1684–1754), and Juste-Aurèle

Meissonnier (1695–1750), and the elegant furniture designs of Gilles-Marie Oppenord (1672–1742). These designs featured shell-like *rocaille* ornament that was asymmetrical in form and arranged in accordance with C- and S-curves. Unlike France, German Rococo was used not only for interiors but also for external façades. French designs were independently interpreted and an autonomous style evolved, centred on Berlin, Munich, and Saxony. In Berlin, the principal representatives of this style were the architect G.W. Knobelsdorff (1699–1753), cabinet-maker Johann August the Elder (1710–81), and the court painter Antoine Pesne who also worked in palaces such as the Neue Palais and the Stadtschloss at Potsdam, at Sanssouci, and in Breslau and Rheinsberg. In Munich the leading exponent was architect and designer François Cuvillies (1695–1768). In Saxony the most significant work was executed by Johann Christoph Knöffel (1686–1752) and Friedrich J.M. Stengel.

In Bavaria planar surfaces were filled entirely with carving and stucco work. In Prussia a more restrained version of Rococo was employed, with greater use of unornamented surfaces and, from 1750, the adoption of naturalistic features, as in the Voltaire Room at Sanssouci. The designs had a greater unity than was to be found in Early Baroque: furniture, panelling, and ceilings were devised in relation to each other and executed through the collaboration of craftsmen, stucco masters, and architects. In the case of Potsdam-Sanssouci (1744), the distinctive styles of Knobelsdorff, Hoppenhaupt, and August Nahl are detectable in the vestibule and the garden room, while J.A. Hülsmann contributed stucco work, carvings, and panelling, and J.M. Kampli and J.F. and H.W. Spindler the furniture (the latter also drawing on the designs of Hoppenhaupt). Antoine Pesne contributed his idiosyncratic “empty” frescoes. At the Residenz in Munich Cuvillies worked alongside J.B. Zimmermann and the cabinet-makers Wenzeslaus Miroffsky and Joachim Dietrich; at the Residenztheater he worked with the sculptor Johann Richard Straub (1704–84).

It is characteristic of Rococo architecture and design, as of Baroque, that palaces and park buildings became smaller and associated with specific functions. This is evident in Ruhesitze or pavilions such as Mon Repos in Bayreuth; in Gartenschlösser, palaces set in large gardens, such as the Belvedere in Vienna and Weimar; in Jagdschlösser, hunting lodges, such as Falkenlust near Brühl; and in Lustschlösser, pleasure palaces, such as Monplaisir in Wolfenbüttel, or Ludwigslust.

Porcelain and lacquer cabinets also became popular from the late 17th century. Initially, Far Eastern porcelain, lacquer trays, silks, and individual art objects from Holland were acquired for such displays; later porcelain of German origin as well as Chinese lacquer furniture were increasingly used. Fine examples of such East Asian rooms are to be found in Schloss Weilburg, Schloss Arnstadt, Nymphenburg, and Bayreuth. Augustus the Strong had already commissioned designs from Pöppelmann for the Chinese Palace (1715–86) and the Indian-style Lustschloss at Pillnitz (1720–21). Most of the porcelain in such collections would have been supplied by the porcelain factory in Meissen, established in 1710. A number of other porcelain factories were subsequently founded: at Nymphenburg (1761), Höchst (1756), Ludwigsburg (1758),

Fürstenberg (1747), Vienna (1717) and Berlin (1761), mostly supplying the various courts. Faience was widely acquired by the bourgeois and aristocratic markets. In 1661 the Dutch established their first ceramics factory in Germany at Hanau, followed by Braunschweig, Kassel, Berlin, Ansbach, Nuremberg, and Strasbourg. During the 18th century large display kilns were built, fine examples of which are to be found at Schönbrunn and at the monastery of St. Florian.

Another elaborate form of display took the form of cabinets decorated with intarsia – a form of inlay combining precious woods and ivory – and examples are to be found at Ludwigsburg and Wolfenbüttel. Of particular interest is the Amber Room, produced using East Prussian amber for the Schloss in Berlin and, in 1717, presented as a gift to Russia. French silk was the favoured wall covering for display rooms, with more rarely embroidered wallhangings (as in the Löwenburg in Kassel), wood panelling, or even feathers (as in Schloss Moritzburg, c.1725). Use was also made in the early period of fine vari-coloured marble incrustation (as in the marble cabinet of 1712 in Ludwigsburg), and around 1720–30 highly polished artificial marble was favoured and used for pillars (as in the Kaisersaal in the Residenz in Würzburg, or the Gartensaal at Sanssouci, Potsdam), entrance areas and, less frequently, living quarters. The more expensive artificial marble became a status symbol.

A further invention of the Baroque and Rococo eras was the Schönheitsgalerie, gallery of beauty, in which portraits of the ladies of the court were displayed. Rooms devoted to the celebration of hunting (as at Ludwigsburg, 1712) were less common, although entire palaces might be devoted to hunting, as at Augustusburg or at Hubertusburg in Saxony. Opportunities for bathing were rare in palaces, since most baths were found in specially designed buildings: the Badenburg in Munich, for example, or the Marmorbad in Kassel, designed by Pierre Etienne Monneot in 1722–28. Around 1710–20 the elaborate court ceremonial also conditioned the decoration of the Paradeschlafzimmer, state bedroom, with canopied beds and elaborate cupboards. Examples have survived in the Residenz of Munich, Schönbrunn and at Kassel.

The staircase was the hallmark of the owner of any palace, its impact achieved by refined architectural design and rich materials – at Bruchsal and in Salzdahlum there is even a grotto under the stairs. As in almost no other type of interior, with the exception of churches, the attempt was made to create a total work of art, with the intention that painting, sculpture, ornamentation, and architecture should combine to create a spatial and theatrical experience. An early example is to be found at Schloss Moritzburg in Zeitz (1657–78), by J.M. Richter the Elder and Younger.

Monasteries occupied a special place within German cultural life. Abbots and bishops were worldly as well as religious leaders, and monasteries, often closely tied to princely families, usually followed secular models, apart from a tendency to display allegories of saints in their ceilings and wall paintings. Renowned ecclesiastical residences were to be found at Würzburg, Mainz, and Brühl. Especially attractive Rococo decoration is to be found in the palace of the Prince-Abbot in Kempten in the Allgäu and in the hunting lodges designed by Schlaun at Clemenswerth and Falkenlust.

The parts of a monastery most readily suited for worldly display were the library, the Kaisersaal, the Prälaten, and the refectory. Next to the chapel itself, the library was the most richly appointed interior, and most libraries had a gallery. Important examples can be found at the Benedictine monastery at Einsiedeln (1738 with stucco by Feichtmayr) and at Fürstentzell (c.1745, by J. Deutschmann, M. Günther, and Zeiller). The three-storey library of the Duchess Anna Amalia of Weimar, created by A. F. Strassburger (1761–66), was clearly intended above all for display, whereas the circular library built for Friedrich II at Sanssouci, with intarsia and elegant Rococo ornamentation, was reserved for purely private study and therefore less functional.

No significant independent bourgeois style of interior decoration existed at this time. In the cities, important architectural commissions were associated only with the palaces of highly placed court officials. Even those bourgeois buildings dating from the second half of the 18th century (the Ermelerhaus in Berlin, Haus Köppelmann in Lippstadt, the Rotes Haus in Monschau, 1762–65) followed models established by the court, albeit in a simplified form. A rare example of a type of interior decoration indebted to both rural and urban tradition is to be found in the architect Schlaun's own house, the Rüschenhaus in Münsterland (1745–48).

With the buildings and interiors of Schloss Solitude and of Mon Repos, by Philippe de La Guépière (1715–73), German architecture rejected the elaborate characteristics of Baroque and Rococo and adopted elements of classicism. An example of interior decoration from the transitional period, the Goldener Saal at Ludwigslust, the Residenz in Mecklenburg (1772–76), with ornamentation made of papier-mâché, already anticipates the rigorous articulation of classicism. In the 1760s purely classical schemes of interior decoration appeared, for example in Schloss Richmond near Braunschweig (1768) where the court architect Karl Christoph Fleischer articulated the space of the severe and symmetrical central oval room by means of bronze-toned pilasters interspersed with delicate arabesques and grisaille medallions with scenes of the Labours of Hercules. At Schloss Wörlitz the architects F. W. Erdmannsdorff and Friedrich Franz von Anhalt-Dessau drew directly on English architecture, interior decoration, and technical achievements. The stucco decoration in the dining room is in the Adam style, the chairs are copies of styles devised by Chippendale, and there are Wedgwood basalt ware vases grouped around the walls.

Attempts were made to incorporate the naturalness, beauty, and utility demanded by the Enlightenment using an idealized image of the Antique, an approach which influenced the contemporary visual arts as much as it was reflected in Winckelmann's interpretation of contemporary archaeological discoveries or in the adaptation of the values of antiquity in the idylls and pastoral poetry of Lessing and other German writers. Classicizing motifs such as urns, rams' heads, and garlands were adopted with enthusiasm, inspired by the engravings of Piranesi and the drawings by Clérisseau. Ornamentation became subordinate to architecture.

In the decorative arts, reactions to the rediscovery of antiquity were reflected not only in the design of porcelain and stoves in classical forms but also in the evolution of the Landschaftszimmer or landscape room, intended to remind its

owner of travels in Italy. Landscapes in the style of Claude Lorrain or Adam Elsheimer were painted on the walls or printed onto wall-coverings, as is the case in the Behnhaus in Lübeck (re-designed in 1800 by J. C. Lille). Occasionally exotic motifs were also employed, particularly after the publication of George Forster's account of his voyages around the world. Examples are to be found in the Turm Kabinett in the small palace on the Pfaueninsel in Berlin (1794, by Brendel). Chinese salons and mirrored cabinets remained fashionable; examples from this period are to be found in Wörlitz or at the Luisium in Dessau. The use of silver and gold elements or marble wall facings had, by now, virtually ceased.

Early classicism, established in Germany by the late 1770s, is also termed Zopfstil (plait or braid style), alluding to its frequent use of garlands and festoons, although this never attained the splendour associated with French interior decoration under Louis XVI. Such decorative schemes were generally implemented on a small scale, as seen in numerous examples from bourgeois interiors. A number of small manor houses in north Germany also have elegant classical interior decoration: in Herrenhaus Tüttendorf, in Schierensee, and in Altenholz, all with delicate stucco work by Michel Angelo Taddei.

As forms became comparatively simple and more architectonic, materials became more valuable; for example, the lavish examples of furniture from the renowned Neuwied firm of Abraham and David Roentgen, which imported items from Russia and France, and the furniture made of precious woods designed by Gontard for the Marmorpalais which had inlays of Wedgwood porcelain and of painted lacquer from the Stobwasser factory in Braunschweig.

Towards the end of the century German classicism became even more severe, dispensing almost entirely with ornamentation. This was similar to what was known in other parts of Europe as the Empire style, but such a name is not appropriate for German classicism as it never ceased to retain its practicality. The leading theorists, architects, and designers of German classicism were based in Berlin: Karl von Gontard (1731–91) designed the richly stuccoed Festsaal in Schloss Friedrichsfelde (1786) and the unadorned staircase in the military orphanage in Potsdam (1771–78); Carl Gotthard Langhans (1732–1808) is notable for a series of clearly articulated oval rooms, such as those in Schloss Bellevue (1791), and the decoration of the Marmorpalais in Potsdam.

Another new architectural form was the public bath, which emerged during the second half of the 18th century. The English city of Bath may have served as a model for such famous resorts as Bad Lachstätt. There were a number of particularly elegant German Kurbauwerke for those taking the cure, such as the interiors of the Palais and the salon building at Bad Doberan (respectively 1806–09 and 1819–21) by C. T. Severin.

While classical German furniture drew initially on French and English models, around 1800 it evolved a style of its own. In place of the furniture partially painted in subdued pastel colours that was typical of the 1780s, wood emerged in its own right, often bearing bronze mounts in the Antique style. Key items of this period were the chest of drawers and the *escritoire*, both frequently assuming forms reminiscent of architecture. Especially fine birchwood *escritaires* were produced around the Baltic coast.

The Napoleonic occupation of many parts of Germany and the demise, in 1806, of the Holy Roman Empire, hindered the rapid evolution of an autonomous German style. Only in Kassel, in the residences of Jérôme of Westphalia, brother of Napoleon, and in the powers tied to France such as Württemberg and Bavaria did the owners of palaces undertake any more ambitious rebuilding or redecoration. Among the furniture brought to Kassel, French pieces dominated; in Munich the French architect Puille redecorated certain rooms. At Ludwigsburg, starting in 1806, substantial alterations were implemented: the architect N.F. von Thouret was commissioned to decorate the Neues Corps of the Logis, where he collaborated closely with J. Klinckfuss, a pupil of Roentgen, and the sculptor A. Isopi. The decoration has elements in common with the French and Russian Empire style and is among the best interior decoration to be created in Germany during this period.

German architecture revived slowly after the end of the Napoleonic occupation, with a new generation of architects not emerging until the 1820s. The leading architect, Karl Friedrich Schinkel, also contributed substantially to the design and decoration of interiors, for example in the Schloss Charlottenhof at Potsdam (1827–28) in which he sought to adapt to contemporary requirements the conception of a villa built in antiquity. Charlottenhof has a vestibule with a double staircase reminiscent of the staircases in the Luisenmausoleum at Charlottenburg or in the Neues Museum in Berlin. Apart from a room with a tented roof, the interior decoration is classicizing in style. One room is entirely decorated with Italian copper engravings, another painted in the “Pompeii red” inspired by the frescoes uncovered in excavations at Pompeii. At Tegel, Schinkel created an elegant vestibule with specially designed pillars and a hall for plaster casts of Antique statues. In a neighbouring building there were sculpted figures by Thorwaldsen and Rauch. Classicized buildings and interior decoration are to be found in the Roman Baths at Potsdam, and in the Orangery at Neustrelitz (1842), painted with motifs taken from the work of Raphael.

Furniture as well as entire decorative schemes were adopted from Antique forms. The dominant motifs in ornamentation were palmettes and acanthus leaves, with arabesques prominent in decorative painting. While the most favoured colours around 1800 were still pastels, subsequently ever more saturated colours were used and the overall colouring of rooms during the early 19th century became darker.

During the Biedermeier period – so-called after an invented literary figure – more attention was paid to interior decoration, comfort being a prime concern. Smaller living quarters required furniture that was practical and simple, and corner and folding tables were introduced. Woods such as walnut, mahogany, and sometimes stained pine, were especially popular, and a huge variety of chair types emerged. Cabinet-makers in Vienna proved especially inventive. Display cabinets and sideboards became objects of domestic curiosity, housing items of memorabilia, as well as decorative art. Other items included pieces made of iron such as flower pots, crosses, and ink wells, from the foundries of Gleiwitz and Berlin who also made spiral staircases; lamps with thin shades (Lithophanien); vases and decorative bowls in porcelain, made by Schumann (Berlin), Tiersch and Altwasser (Silesia); cut and coloured

Germany: hall, Schloss Charlottenhof, Potsdam, by K.F. Schinkel, 1827–28

glass; decorative cloths and cushions embroidered at home. Lithographs and works in watercolour or gouache were displayed on the walls.

Inexpensive objets d'art and objects intended for display became accessible to a bourgeois market, among them the crater vases produced by the Königliche Porzellan Manufaktur in Berlin, and the Warwick vase worked in silver by J.G. Hossauer to patterns provided by Schinkel. The aim was to encourage German craftsmanship, which at the time was making little use of the latest technology. As a result of support from the Prussian court, Berlin gradually emerged as a centre of decorative arts and industry.

Among the most important architects working in Munich during the first half of the 19th century were Leo von Klenze and Friedrich von Gärtner. Gärtner designed not only classical interiors (Residenztheater, 1823), but also frequently cited Early Italian Renaissance motifs in exterior façades. In Braunschweig after 1831, T. Ottmer decorated the Residenzschloss (destroyed in 1961), a work already pointing to late classicism in its extensive ornamentation. In 1837–40 Georg Moller decorated the interiors of the palace in Wiesbaden. Drawing on the example of the rotunda of Schinkel's Altes Museum in Berlin, itself an adaptation of the Pantheon in Rome, Moller created a domed room with niches which were filled by sculpted figures by Schwanthaler.

The era of political Restoration brought a return to past traditions and styles. Whereas architects and designers had previously looked towards classical Italian models or to the Antique, after 1815 Gothic began to exert its appeal. Neo-Gothic interiors in combination with gardens were to be found in the Gotisches Haus in Wörlitz (1773) and the Meierei on the Pfaueninsel (1795). Like Chinese temples (Wilhelmshöhe), Moorish mosques (Schwetzingen), or ruins (the theatre at Sanspareil), these were regarded as embodiments of the exotic. The effects were generally a painterly combination of pseudo-

Gothic and the grotesque, similar to the designs popularized in England by William Halfpenny.

The first neo-Gothic castles included Landsberg (1836–40) by A.W. Doebner and K.A. Heidloff; Albrechtsburg and Reinhardsbrunn in Saxony (1827–35, by G. von Eberhard and Heidloff). Although Schinkel, who also built in this style, designed Neo-Gothic furniture, he mainly used old pieces in his interiors to evoke a sense of age and tradition. The building of Stolzenfels on historic ruins is ultimately to be understood as an act of reconstruction of the sort previously attempted in 1799 by Friedrich Gilly in his aquatint illustrations of the East Prussian fortress of Marienburg. During the completion of Cologne Cathedral (1842–80), systematic research into medieval Gothic was pursued. The secular counterpart is to be found in the decoration of the Wartburg near Eisenach. Here, the old decoration was partially restored and supplemented and the artist Moritz von Schwind painted a renowned Wartburg fresco. The decoration was completed in 1902–06 with the addition of glass mosaic by A. Oetken in the Elisabeth-Kemenate.

Later examples of Gothic Revival architecture in Germany include Marienburg near Hildesheim (1857–67, by Hase, with decoration by Edwin Oppler); the fortress at Wernigerode (1862–68); the hunting lodge at Letzlingen (1843) by King Friedrich IV and F.A. Stüler; and Schloss Drachenburg (1884), one of many Rhine fortresses. The success of this style is explained not only by the painterly effect but also by its appropriation as a national German style that was regarded, in the aftermath of the Napoleonic Wars, as anti-French. Among the books and volumes of designs published on Gothic architecture during the first half of the 19th century were K.A. Heidloff's *Ornamentik des Mittelalters* (1832–52) and Becker and Hefner-Altenack's *Kunstgewerbe und Gerätschaften des Mittelalters* (1852).

A Rococo Revival was to be found in Russia by the late 1820s, in architectural projects commissioned by Tsar Nicholas I and his consort Charlotte of Prussia from the architect A.I. Shtakensneider. It was probably Shtakensneider who encouraged the Rococo decoration of the Imperial guest apartments in the Orangery at Potsdam (1851–64, by F. Stüler and Hesse), which had originally been built in the style of the Italian Renaissance, even including a Raphael Room with copies of famous paintings by the artist. In Vienna the Rococo Revival appeared at approximately the same time, sometimes drawing on French models, as in the decoration of the Lichenstein Majoratshaus, by F.A. Leistler. It was a style that was reflected in developments in the decorative arts and in the ornamentation of furniture, but it resulted in few great building projects. A late example is Schloss Linderhof. While earlier examples of Rococo Revival tended, unlike the 18th-century Rococo, to use ornament symmetrically and to combine Rococo and classical elements, this later instance incorporates an excess of ornamentation that is more theatrical than historical.

Although German Historicism may be found to have had precedents in the early 19th century, it emerged more strongly after the death of Schinkel and especially after 1850. Alongside the Neo-Gothic and the Rococo Revival, styles associated with the Renaissance were also popular. While Leo von Klenze and Schinkel had pre-empted such styles (respectively, in Palais

Beauharnais of 1816, and in Palais Redern of 1832), the first high-point of the German 19th-century Neo-Renaissance is to be found in the Residenz at Schwerin of 1843–57, designed by Stüler and G.A. Demmler, based on the Loire châteaux. At Schwerin, above all in the panelled Ahnengalerie and the stuccoed throne room, classical ornamentation was partially combined with that derived from the Renaissance. Another important representative of the Neo-Renaissance style was Gottfried Semper (1803–79), the key historicist architectural theorist, architect, and decorator. Among his most important buildings were the Gemäldegalerie (1847–54) and the Opera in Dresden (1871–78); the polytechnic and the observatory in Zürich (1858–64) and new plans for the Hofburg and the Burgtheater in Vienna (1869–1903). While not rejecting the stylistic mixture of the mid-19th century, Semper also emphasised the need for a meaningful use of space and ornament.

Although it had been acceptable to use the Rococo Revival in interior decoration in a Neo-Gothic schloss, as in the royal Villa Berg near Stuttgart of 1845–53, or to combine Tudor and Rococo decorative styles, a much closer adherence to historical fidelity was now required. One of the most knowledgeable proponents of this idea was Duke Georg II of Meiningen, who assembled artists and craftsmen at his court, one of their aims being to create buildings in historicizing styles mostly tending to Neo-Renaissance. Alongside the leading 19th-century academies of Munich, Berlin, Karlsruhe, and Düsseldorf, the true centres for the dissemination of new architectural and decorative styles were the regional schools of applied arts, the Kunstgewerbeschulen and the technical universities, the Technische Universitäten. Those in Prague (established c.1803) and Vienna (1815), where leading architects and craftsmen often held teaching positions, were especially significant.

The interplay of industry, research, and artistry resulted in many innovations in interior design, including inexpensive textiles, pressed glass, stone pasteboard for use in place of stucco, pre-coloured terracotta to imitate carving work, linoleum, rubber, aluminium, and brass. It is significant that these new materials were often used as substitutes for natural elements. Increasing mechanization made the production of elaborate furnishing forms relatively inexpensive and mass-production became a key aspect of Historicism. As had been the case in the Baroque era, the appearance of the materials used counted for more than their authenticity. The decoration of interiors with ornaments and knick-knacks made this virtually inevitable, but it is necessary to distinguish between the houses and apartments of the upper bourgeoisie, where very valuable works of art might be found, and those of the lower classes, where copies of such works appeared, made with simple materials and poorly worked – silver-plated tin goblets, prints imitating oil paintings, plaster busts, and imitation bronze sculptures (*Ladenbronzen*). Of particular importance were the exhibitions of decorative art and, above all, the international exhibitions, which had a considerable influence on Germany's stylistic development.

Between 1860 and 1900, the Neo-Renaissance established itself as the leading style in German-speaking Europe. The centres of this development were Vienna and Munich where large exhibitions had promoted this style – respectively the Weltausstellung of 1873 and the Kunstgewerbeausstellung of 1876. After the removal of the Viennese fortifications in 1858,

the Ringstrasse replacing them was planned as a centre of cultural and political life. The scheme included buildings in Neo-Gothic and Neo-Classical style (respectively, the town hall and the Parliament). In the case of the Burgtheater, the new wing of the Hofburg, and the Opera House (the latter of 1861–69 by Eduard Van der Nüll and August von Siccardsburg), both architecture and interior decoration drew on models from the Florentine and Venetian Renaissance. German Neo-Renaissance architecture also looked to the Flemish Renaissance and, at a later date, to the German Renaissance (above all the “Weser Renaissance”, an example of which is the Palais Schack in Munich, built in 1872 by L. Gedon).

Many publications served to guide taste, among them Georg Hirth's *Das deutsche Zimmer der Renaissance* (1880) and *Das deutsche Zimmer der Gotik und Renaissance, des Barock und Rococo* (1886). The most explicit form of stylistic quotation in later German 19th-century decoration is to be found in wood panelling on walls and in coffered ceilings. The Neo-Renaissance style reached its high-point and its end in the historicist interiors of the Makart-style, called after the painter Hans Makart and characterized by especially dark colouring, rich drapery, and opulent ornamentation, as in Makart's paintings.

In the late 1880s the Baroque Revival and a new Rococo Revival – the so-called “third Rococo” – attained a popularity comparable to that of the Neo-Renaissance. While Rococo Revival, promoted by Princess Eugénie of France, had a considerable impact in the realm of fashion, it was relatively unsuccessful in interior decoration, although examples are to be found in some of the palaces built for Ludwig II of Bavaria – Schloss Linderhof by Georg Dollmann and others (with decoration, from 1870, by Franz Seitz and Eugen Drollinger) and Schloss Herrenchiemsee (1878–86). The façade, mirrored hall, and principal bedroom of the latter were modelled on the Château de Versailles, the copy far outshining the original in its excess of ornamentation. The Festsaal of Schloss Bückeburg is oriented more towards historical forms, with artificial marble, a fresco, and Rococo stucco work.

There remained a considerable difference between the decoration of private, bourgeois interiors, and that of public buildings, but a notable element of display now entered the private sphere. As a result of the ennobling of members of the bourgeoisie enriched through industry, the villa and the country house took on a special importance. Countless villas were built for factory owners, partly in competition with the houses of rich gentlemen farmers who did not wish to be outdone. Particularly elaborate examples of villas in a historicist style are the Lenbachhaus and the Villa Stuck in Munich (both built for successful artists) and the Villa Hügel in Essen (1870–72, by Rasch) – hardly distinguishable in their interior decoration from the houses of the landed nobility. Even in the apartment blocks built from the 1860s onwards an attempt was made to adapt elements from more expansive architectural projects, by adding elegant staircases and by decorating them with stucco work, paintings, lanterns, wall fountains, and reliefs; later there were elaborately designed lifts. Stuccoed ceilings and double doors were regarded as essential everywhere except in apartments opening on to backyards.

The interior decoration of public buildings such as town

Germany: entrance of Klein carpet shop, Hagen, by Peter Behrens, 1906–07

halls, universities, schools, and ministries aimed for a sense of dignity and status. After 1871 the predominantly Neo-Baroque interiors of courts of justice became more sumptuous, as if to underline their role in the new Imperial constitution. Examples are to be found in the Imperial court in Leipzig and the courts in the Schöneberg, Mitte, and Moabit districts of Berlin. Offices of the bureaucracy in general, as an expression of an era of Parliamentarianism, presented architects with a specific task. Yet another was represented by buildings of great cultural significance – opera houses and theatres – such as the Musikverein in Vienna and the Festspielhaus in Bayreuth. To these must be added a series of museums, some of which have in part retained their decoration, such as the Kunsthalle in Hamburg (Neo-Renaissance, 1863–68, by G.T. Schirrmacher and H. von der Hude) and, in Berlin, the Nationalgalerie (Neo-Classical, 1866–76, by A. Strack and Stüler). The interiors of the Bodemuseum in Berlin, meanwhile, were executed in the styles of various art historical eras.

Around 1895 Historicism attracted increasing criticism: it was argued that in its excess of ornamentation, the Neo-Renaissance stifled architecture, while the production methods employed were mechanical and superficial. The reaction of the furniture industry was to produce items decorated with simpler leaf and floral forms adopted from those of the French Art Nouveau. But at a more fundamental level no change occurred until the emergence of the group of architects assembled by the Grand Duke of Hesse in Darmstadt. These architects, who

Germany: hall, Zuckerkandl House, Berlin, by Hermann Muthesius, 1914

included Joseph Maria Olbrich, Hermann Obrist and Peter Behrens, committed themselves to a programme of radical reform, breaking with tradition, freeing architecture from superfluous stucco work, and opposing mechanical mass-production. Authentic materials were to be used in interior decoration. Around 1900 many of these architects built houses for themselves in Darmstadt, but these houses, with their unified style and special fittings, were considered elitist. The Jugendstil (named after the Munich weekly periodical founded in 1896) also employed leaf and floral forms but stylized them into almost geometrical shapes, resulting in more abstract forms approaching those favoured by the later Art Deco movement. In the work of the designer Henry van de Velde, however, inspired by his native Belgian Art Nouveau, the sweeping forms were softened and became more economical. His furniture designs were elegant and simple but relied on the use of expensive materials.

In Vienna a number of architects and painters were associated with the Secession (1897–1907). The most progressive of these was Adolf Loos (1870–1933). His Haus am Michaelerplatz and his American Bar Wien were designed to be free of ornament and to achieve their effect purely through their architectural form and the quality of the materials used, an approach propounded in his essay of 1908, “Ornament und Verbrechen” (Ornament and Crime). In the extravagant Secession building erected in 1897–1898, Joseph Maria Olbrich combined a simple basic form, with a dome covered in stylized laurel leaves, while Otto Wagner created a forward-

looking interior in his glass-roofed central hall for the Vienna Postsparkasse (Postal Savings Bank) of 1904–06. Josef Hoffmann (1870–1956) who, in 1910, was to become the founder of the Österreichischer Werkbund, built a large number of villas and sanatoria. His designs for textiles and furniture partially reveal the influence of Scottish designer Charles Rennie Mackintosh. In planning the Palais Stoclet near Brussels (built 1905–11), he collaborated on the interior with the Viennese painter Gustav Klimt. A number of important schemes for interior decoration were produced by his friend and collaborator Koloman Moser.

English Arts and Crafts architecture also proved a source of great inspiration for Hermann Muthesius (1861–1927), whose book *Das Englische Haus* (1904–05) had a significant influence on the planning of garden cities in Germany as well as on interior decoration, even though Muthesius himself generally built private villas. Schulze-Naumburg’s Palais Cecilienhof in Potsdam (1913–17) draws directly on English models.

Around 1900, alongside the many luxurious schemes of Jugendstil interior decoration, new demands and new decorative programmes arose in response to the widespread housing shortage. From 1893 a specially designed type of apartment block was built in Berlin by Alfred Messel and subsequently by Paul Mebes and others, which offered a more economical use of space, better sanitation, and more pleasant living rooms. The furnishing for such apartments became the province of the newly established Werkschulen (factory schools) and of organizations such as the Vereinigten Deutschen Werkstätten. The first German garden city, Hellerau, was built for workers in the Dresden factories by Muthesius (1908), H. Tessonow (houses and theatre, 1910–11) and Riemerschmid (workshops, 1911). All three architects were also involved in work on interior decoration, to which the furniture designers Schlecta and Wytrlik contributed.

In 1907 the Deutscher Werkbund was founded as an alliance of established artists and industrialists. Functioning as an advisory body, it provided new ideas on matters of design. The functional construction of furniture and inexpensive programmes of interior decoration served as a counter-movement to the elitist Jugendstil. New working-class residential districts were often built in a similar sort of “rural” style as that employed for many villas, with architecture expected to imitate a certain form of rusticity while promoting a healthier way of life.

In spite of its reliance on simplicity, the formal variety of German Jugendstil is clearly demonstrated in the fitting out of shop interiors (known now only through plans and photographs): Peter Behrens (1868–1940), chief designer and architect at AEG, designed the company’s principal showroom in Berlin in 1910; August Endell (1871–1925), who adopted a Moorish-influenced Jugendstil, designed the Salamander shoe shop in Berlin in 1915 and the Elvira photographic studio in Munich in 1897; Messel, Riemerschmid and van de Velde redesigned the Berlin art gallery of Keller und Reiner; and in 1899 van de Velde designed a salesroom for the Havana company. The highpoint of technical innovation was the interior of the automat restaurant on Friedrichstrasse in Berlin (1904–05).

The interior decoration of department stores was particularly noteworthy, although the majority of these have not

survived (an exception is the Kaufhaus zur Straussen in Görlitz). A highly influential architect in this area was Alfred Messel, who was engaged by the Berlin department store Wertheim. With his architectonically conceived interior courtyards, he created an imposing, yet still functional, architecture where techniques and materials such as marble incrustation and gilt bronze were used for both interior and external decoration. World War I brought many developments in German interior decoration and design to a halt. The re-orientation of the 1920s pointed in a variety of directions.

Following the emergence, in 1905–20, of Expressionist artist groups such as Der Blaue Reiter and Die Brücke and the literary association Der gläserne Kette, an Expressionist form of architecture evolved, turning above all to crystalline forms, the first examples appearing around 1919. Otto Bartning and the brothers Wassili and Hans Luckhardt created several interiors in this style. The use of pointed shapes in combination with brick is characteristic of the work of the north German architect Fritz Höttger, examples of which are to be found in Böttgerstrasse, Bremen, 1926–27, and the Chilehaus, Hamburg. In 1929–31 Hans Poelzig decorated the staircase and the façade of the Haus des Rundfunks in Berlin and is also known for his cave-like interior for the city's Grosses Schauspielhaus (1918–19). Founder-director of the Bauhaus School of architecture and design, Walter Gropius (1883–1969) was also interested in crystalline forms, as is evident in his work at the Holzhaus Sommerfeld (1920) and the Haus Otto in Berlin (1921–22). Erich Mendelsohn, meanwhile, designed angular furniture for his idiosyncratic Einsteinurm in Potsdam, built in 1920–21.

Expressionist buildings were erected throughout the 1920s, but from 1925 a new movement was underway, centred on the Bauhaus in Dessau and later in Weimar, led chiefly by the architects Walter Gropius, Mart Stam, and later Mies van der Rohe, who designed new furniture: key examples were Stam's *Freischwinger* or suspended chair, and the MR chair by Mies. In contrast to the Jugendstil era, design and manufacture were contemporaneous, and new combinations of materials were introduced, such as leather and steel.

During this period there was a strong interest in housing for workers combined with a leaning towards the traditional pre-war forms which resulted in designs such as Grete Schütte-Lihotzky's "Frankfurt kitchen" and the contemporary estates of houses for workers in Frankfurt am Main designed by Ernst Meys. Such estates, and also those in Berlin (Siemensstadt, Weisse Stadt, 1929–31), show that this development had lost none of its relevance decades later. The large architectural exhibition held in 1927 at the Weissenhof in Stuttgart represented both a simple and a more sophisticated standard of living, and architects such as Behrens, Stam, Gropius, and Le Corbusier designed houses and schemes of interior decoration for this event.

While industrial mass production remained prominent, particularly in the manufacture of textiles and pottery, there was also great emphasis on the individual artist-made object. Lilly Reich, for example, produced excellent textiles, Gunta Stölzl was known for her carpets and Gerhard Marcks for ceramic sculpture. There were also occasional examples of wall painting, as in the Bauhaus staircase. Oskar Schlemmer devised a mural for the country house at Mattern near Potsdam,

designed in 1934 by Scharoun. Bruno Taut, who in 1924 published *Die neue Wohnung*, was noted for his particularly colourful treatment of walls. Rudolf Steiner's Anthroposophy system of mystical philosophy embraced ideas on decoration relating to the colour, materials, and geometry of interiors and exteriors. Examples of architectural projects accommodating these ideas are the second Goetheanum near Basle (1923–28) and numerous buildings by Hans Scharoun, including the Philharmonie in Berlin (1963).

Far less radical than the work of the Bauhaus, and consequently a great deal more popular with the German public during the 1920s, were the architectural forms of the Heimatstil. Fixed fittings, of the kind initially introduced by the Deutscher Werkbund, were modified and further developed by Bruno Paul during the 1930s. A leading influence by this period was the Reichsheimstättenamt (Imperial Office for Homes), under the direction of Robert Ley. The National Socialist regime especially encouraged the design of simple timeless furniture. At the 1934 Deutsche Siedlungs-Ausstellung held in Munich, extremely simple, even Spartan furniture was shown, the so-called "settler furniture", intended above all for young families. The Reichsausstellung Schaffendes Volk, held in Düsseldorf in 1937, showed interior decoration schemes intended for the bourgeoisie which were formally more elaborate and sometimes also ornamented, often in imitation of older patterns, though retaining an essentially unpretentious character. This sort of somewhat bleak simplicity was also to be found in the interiors of buildings designed for the governing cadres, as at the country houses of Carinhalle in Brandenburg, "Berghof" at Obersalzberg, and the Reichskanzlei in Berlin.

While it is true that Ludwig Troost continued to employ a simple Art Deco style, he nonetheless combined this with intarsia, using precious materials and expensive textiles. The illusion of a certain solidity in furniture and interiors was evoked by means of free borrowings from the Baroque, known as the Mastaba style, and Renaissance coffering. Brown and green dominated most colour schemes. Despite public rejection of the Bauhaus's ideas, its practical achievements were eagerly copied, above all in the realm of industrial design. The interiors of public buildings such as the Haus der deutschen Kunst in Munich, and the airport at Tempelhof outside Berlin followed classical models, while dispensing with ornamentation, appearing as a result both timeless and unostentatious. A favoured facing material was travertine and, more distinctively, marble.

After World War II there was a return to the ideas of the Deutscher Werkbund and of the Bauhaus. Because of the dearth of fresh materials and the extensive destruction of houses and apartment buildings, the first postwar furniture exhibitions, in 1949 (Neues Wohnen in Cologne and Wie wohnen in Stuttgart), showed items that were extremely simple, even primitive, often made of plywood. Leading designers of this period were Hans Schwippert, Otto Bartning, Paul Renner, Egon Eiermann, Hans Scharoun, Bruno Taut, Lilly Reich, and Hermann Henselmann.

During the 1950s German interior decoration and design followed American and Scandinavian models. Organic forms, natural and durable materials (teak and linen, for example) and ergonomic chairs and beds from Scandinavia remained in

Atrium of Haas Haus, Vienna, by Hans Hollein, 1985–90

the forefront into the 1960s. Popular American innovations included artificial materials (such as foam rubber, synthetic fibres, imitation leather) and coloured veneers. Furniture designed by Charles Eames, Harry Bertoia, and Eero Saarinen was especially fashionable, the US firm of Knoll International in Stuttgart producing versions of such designs or devising interior decoration for homes in collaboration with German architects. Leading German furniture designers included Egon Eiermann, Sep Ruf, Hans Gugelot, Herbert Hirche, and Eduard Ludwig.

Furniture of the 1950s and 1960s was not only smaller and lower than in the past, but also gave an overall impression of greater lightness. Tubular steel supports were often used, for instance, in the interior of the Hilton Hotel in Berlin (examples now in the Berlin Museum). More thought was given to developing space-saving forms of furniture – folding beds, combined dining and living rooms, integrated desk-tables or room dividers. Typical of German design of this period was the kidney-shaped table (designed in 1952 by Heinz Vetter) and the cone-shaped lamp, sometimes used in clusters. Furniture forms often recalled the paintings and sculpture of Hans Arp, Willi Baumeister, Ernst Wilhelm Nay, and Victor Vasarely.

Although there was little experimentation in political life during the Adenauer period (1949–63), the model city quarter of West Berlin, the Interbau (initiated in 1957), represents something of an exception. German and foreign architects were engaged to design both outer structures and their interiors. Staircases and assembly halls were used for display (as in the case of the Schillertheater in West Berlin), their decoration often incorporating wall sculptures or inner or outer murals.

After the formal division of Germany in 1949, the German Democratic Republic in the East looked initially to much the same models as did the Federal Republic in the West. The principal distinction was the imposition in the GDR of standard furniture designs, a Socialist-planned economy favouring standardization. Because the intention was to offer inexpensive furniture, cheap materials were used, often resulting in a decline in quality. The range of choice in furnishings, as in types of new residential accommodation, was limited, although great attention was paid to the design of public buildings, in which display invariably served a political, often propagandist, purpose. It was only during the 1970s that an attempt was made to catch up with international standards, notably in the building of the Palast der Republik in the centre of Berlin and in the Interhotels erected in various East German cities.

In the West the 1960s designs now readily termed modern had a traditional counterpart in the so-called Gelsenkirchen Baroque, a robust form of furniture and interior decoration, notable for its allusion to past styles, its reliance on forms evolved during the 1930s, and a somewhat uncertain sense of design. In line with the attempt to appeal to a largely working-class market, the style was named after a centre of the German mining industry.

During the 1960s a simpler, more geometric building style evolved, which was also reflected in interior decoration. In the now popular bungalows (Kaiserbungalow, by Sep Ruf) the design of walls and windows was of particular importance, although this was also true of public buildings, as

demonstrated by the interiors of the Deutsche Oper and the Reichstagsgebäude in West Berlin (both 1961–72, by Paul Baumgarten). The West Berlin shopping arcade, the Europacenter (1963–65, by Werner Düttmann and Egon Eiermann), was notable for the restrained elegance of its reflective surfaces and coloured glass chandeliers.

While, on the one hand, an architecture favouring the use of substances such as wood, glass, and visible concrete evolved, architects also tended to use an increasing number of objects made of plastic and other artificial materials. Characteristic of 1960s interior decoration and furnishing were the fitted cupboard or wardrobe, the television console, the extendable sofa, and the low coffee table. Particularly popular were Verner Panton's plastic stacking chair (1960–67, for Vitra) and objects in spherical form (ash trays, televisions, lampshades).

With the advent of the mid-1970s oil crisis there emerged a need for an entirely new approach. A heightened awareness of the environment in combination with a preference for natural materials had a marked impact on interior decoration – wooden floors, fabric or cork floor coverings, and brown and green tones were favoured. An example of the transition between the garish colours of the early 1960s and the subdued tones of the end of the decade is to be found in the carriages of the Deutsche Bundesbahn's Inter-City trains which are decorated in orange, brown and green.

It is difficult to speak of an independent and distinctive German design in the 1970s and 1980s since national developments invariably emerge from interaction with a wider, international context. The futuristic metal forms employed in the Internationales Congress Centrum in Berlin (1975–79, by R. Schüler and U. Schüler-Witte) were to be found in public buildings of this period, but they were unpopular. The design of interiors incorporating solid wood, brick, and sisal floor covering, such as the library of the Philosophy Faculty of the Freie Universität in West Berlin (1982–83, by Hinrich and Inken Baller), may be seen as a reaction to such criticism.

The leading representative of Postmodernism in German interior decoration and design is Hans Hollein. His schemes for the interiors of shops in Vienna range from interiors for the candle-seller Retti (1964–65) to interiors for the jeweller's Schullin (1981–82), with its Egyptian ambience, and the Austrian Travel Agency, where decorative motifs allude to palms, mosque, and a Rolls-Royce. Hollein likes to combine a variety of stones (marble, sandstone) with polished metal or metal alloy. Other examples of Postmodern architecture and design in Germany are James Stirling's Wissenschaftszentrum in Berlin and his Staatsgalerie for Stuttgart. In the designs of the Viennese Coop Himmelblau, interiors and exteriors are merged, deconstruction itself being elevated to a method of design. The Pentagon design group of Cologne is also important, in particular for its original response to the influence of the Memphis design group and Italian Postmodernism in general. Leading contemporary design firms include Vorwerk, makers of carpets (which has collaborated with many architects), Vitra and Tehta who both make office furniture.

Gibbons, Grinling 1648–1721

British carver and sculptor

Grinling Gibbons was the most famous carver of his generation. From his arrival in England from Holland in about 1667 he helped establish the fashion for flamboyant Dutch-style carving which dominated the decoration of the late 17th century interior.

Gibbons probably trained in the workshop of Arnold Quellin (or Artus Quellinus) in Amsterdam. Quellin and his sons were involved in the decoration of the impressive Town Hall in Amsterdam. Gibbons first came to notice in March 1671 when John Evelyn showed a piece of his work to Charles II and, according to Evelyn, the king "cast his eye on the Worke but he was astonish'd at the curiositie of it, & considered it a long time." From this point on, Gibbons was

commissioned to work at a number of royal palaces, commencing in 1677 in the King's Eating Room and Queen's Audience Chamber at Windsor Castle and continuing into the reign of William and Mary at Kensington Palace, Whitehall, St. James's and Hampton Court. Gibbons worked for the Board of Works as part of a team of carvers and decorators supervised by Sir Christopher Wren as Surveyor-General of the King's Works. But he was granted personal recognition in 1682 when he was given the official role of Surveyor and Repairer of Carved Work at Windsor by Charles II and a salary of £100 a year. He received further royal favour in 1693, when William III appointed him Master Sculptor and Carver in Wood to the Crown.

The royal commissions undertaken by Gibbons rank among his most important work and they helped establish his predominant influence in interior decoration. The virtuoso decorative carvings in limewood or oak which he carved in the form of overmantels and overdoors at Windsor, Hampton Court and Kensington Palace created a considerable impact at the time and were termed "incomparable" by contemporaries such as Evelyn. Gibbons and his studio also put their stamp on other interior decorative features, including carved door frames, picture frames, and marble chimneypieces. The bills of 1676–77 for the work at Windsor Castle (where Gibbons worked with Master Sculptor and Carver Henry Phillips) specify: "Severall sorts of Carved workes ... performed upon the Chimney peeces Pedestalls and picture frames of the Kings Greate and Little Bedchambers". His most exuberant work was reserved for the King's Chapel, Windsor (1680–82), carvings of sprays of palm and laurel which John Evelyn struggled to describe in 1683 as "stupendous and beyond all description the incomparable carving of our Gibbons, who is without controversie the greatest master both for invention and rareness of work that the world ever had in any age."

At Whitehall Palace from 1685 Gibbons supplied a carved chimneypiece surmounted by a crown and coat of arms for the Great Bedchamber and a marble altarpiece for the chapel which he worked on with Artus Quellinus. Gibbons was also responsible for a number of interior decorative features at Kensington Palace, including a pair of gilt overmantels in the Queen's Gallery, carved in 1691 with drapes and festoons. At Hampton Court, Gibbons and his team worked extensively on the new State Apartments built for William and Mary from 1689 to 1694, including carved door and window mouldings and overmantel and overdoor decorative fruit and floral drops. In the Chapel Royal in 1699 Gibbons carved the decoration for a reredos designed by Sir Christopher Wren.

Royal commissions were prestigious and an excellent showcase for skills, as contemporaries were able to visit palaces and admire Gibbons's work. After her visit to the King's Chapel, Windsor, in 1698 the diarist and traveller Celia Fiennes wrote of "the exactest workmanship in the wood carving ... the pattern and masterpiece of all such work both in figures, fruitages, beasts, birds, flowers all sorts, soe thinn the wood and all white natural wood without varnish ... here is a great quality."

Gibbons was also employed by the crown as a virtuoso carver and he was commissioned to carve exceptional pieces – for instance the panel sent as a gift in 1682 to Cosimo III, Grand Duke of Tuscany (the so-called *Cosimo* panel). In addi-

tion, William III commissioned him to decorate the catafalque erected in Westminster Abbey for the funeral of Queen Mary.

Queen Mary's catafalque was not Gibbons's only funerary work: he carved more than 30 funerary monuments in his workshop from the late 1670s onwards, including the important stone monuments of Robert Cotton (dated 1697) and the first Duke of Beaufort (dated 1700) in St. Paul's Cathedral.

Not all Gibbons's work, however, involved royal commissions; the fashion for carved work made popular by his work in royal palaces led to commissions for other important patrons. Gibbons's first major non-royal commission was for Charles Seymour, 6th Duke of Somerset, at Petworth House in Sussex, where he supplied a pair of elaborately carved picture frames and pendants for the Carved Room. He also worked at Badminton House, Gloucestershire, for the 1st Duke of Beaufort, where he carved a decorative overmantel for the great parlour incorporating dead game, woodcock and partridge. He carved one of his most beautiful commissions for Anne, Duchess of Buccleuch, at Dalkeith House who paid £800 to "Mr. Grin Gibbons for carving a marble Baster-leaf", of the story of Neptune and Galatea; a skilfully carved plaque, which is probably Gibbons's best work in marble. Similarly, at Blenheim he worked with decorative marble for Sarah, Duchess of Marlborough, and in 1712 he supervised eight men to work marble for the niches in the Saloon.

Gibbons also worked on several religious commissions. From 1696 to 1697 he carved two banks of choir stalls, the bishop's throne and stall in stone, oak and limewood at St. Paul's Cathedral, and he worked on the case and screen of the great west organ. His work for St. James's, Piccadilly, is typical of the type of carving Gibbons supplied for churches: Evelyn describes the "flowers & garland about the walls".

Grinling Gibbons undoubtedly played a key role in the history of late 17th century interior decoration. His richly decorated carving, teamed with Baroque painted rooms by Antonio Verrio (for instance at Burghley House) set the standard for the grand style of decoration in noble houses and palaces at this period. His style of carving was much admired throughout his life and he was believed with justification by contemporaries to be "incomparable".

SUSAN JENKINS

Biography

Born in Rotterdam, the Netherlands, 4 April 1648. Trained as a woodcarver, possibly in the Quellin workshops, Amsterdam or Antwerp, c.1665. Settled in England, c.1667. Married c. 1670: 5 sons and 6 daughters. Worked as a ship's carver, Deptford; "discovered" by John Evelyn and introduced to Charles II and Christopher Wren, c.1670. Active as a carver from the early 1670s, and as a sculptor and carver of monuments from the mid-1670s. In partnership with Arnold Quellin, 1681–83. Appointed Surveyor and Repairer of Carved Work, Windsor Castle, 1682; appointed Master Sculptor and Carver in Wood, 1693; appointed Master Carpenter to the King's Works, 1719. Admitted to the freedom of the Drapers' Company, 1672; appointed Renter-Warden, 1705; acted as Master, 1718–20. Died in London, 3 August 1721; buried at St. Paul's, Covent Garden.

Selected Works

Examples of Gibbons's drawings, mainly for projects at Hampton Court, are in Sir John Soane's Museum, London. Additional drawings and manuscript sources are listed in Beard 1989. Examples of

Gibbons's carved work in wood can be seen at Blenheim Palace, Hampton Court, and Petworth House. The *Cosimo* panel is in the Pitti Palace, Florence.

Carvings

- 1676–92 Trinity College, Cambridge (library)
- 1677–78 Windsor Castle, Berkshire (carvings for various rooms, including the King's Eating Room and the Queen's Audience Chamber)
- 1681–82 *Cosimo* panel, for Cosimo III, Grand Duke of Tuscany
- 1690–91 Kensington Palace, London (carvings in Queen Mary's bedchamber, and frames for chimney glasses)
- c.1692 Petworth House, West Sussex (Carved Room)
- 1697–1719 Hampton Court, Middlesex (carving for the King's Staircase, and in various interiors including the Chapel Royal, the King's bedchamber, and the music room)

Gillow & Co.

British upholsterers, cabinet-makers and makers of furniture; established c.1728; amalgamated as Waring & Gillow 1903

The famous furnishing business of Gillow of Lancaster (later Waring and Gillow) holds an important place in the history of furniture and furnishings. Not only were they among the longest established businesses in the trade who also held an enviable record of maintaining production of quality products, but their legacy of the Gillow Archive is also of great impor-

Gillow: design for a bedroom, c.1820

tance. The archive, housed at Westminster City Libraries, is an unsurpassed source of design and business history for much of the 18th and 19th centuries. The archive, parts of which date from 1731, includes account books, day books, cash books, bill books, drawing books, packing books, accounts and letters. However, the Estimate sketch books which date from the 1760s are perhaps the most valuable as they give detailed drawings of items, prices, materials, and list the name of the makers and the customer. This record is invaluable for considering provenance as well as building a picture of both taste and

trade. In addition, during the last quarter of the 18th century the firm began the practice of stamping furniture items with their name which has been another valuable aid to identification.

The firm was established in 1728 by Robert Gillow who finished his apprenticeship and became a freeman of Lancaster in that year. The choice of Lancaster as a base for the business was eminently sensible. The importance of the port as a centre for the receipt of raw imports and for the export of finished goods made it ideal for an entrepreneur furniture-maker. Trade

with the West Indies meant that finished furniture would be exported, and rum and sugar, as well as the all-important mahogany timber, would be imported through the port. This Atlantic trade was later followed by trading on the Baltic route which ensured supplies of oak and pine for the company.

In 1757 Richard Gillow, the eldest son, was taken into the business, having been trained as an architect; in 1769 another son, Robert, took over the running of the London branch which had been established some four years previously. Both these members of the family brought to the business differing skills which were invaluable in developing the firm. Robert Gillow died in 1772 but the family remained in control until 1814. This period under the management of Richard Gillow was one of the firm's most prosperous periods. Many large commissions were carried out for country houses, including *Workington Hall*, Cumbria, Tatton Park, near Manchester, and Farnley Hall, Otley. It was also a time of innovation in furniture design. Richard Gillow patented a method of extending dining tables by using a system of slides, and the firm also developed revolving bookshelves and the well-known small chests with writing slopes, allegedly called after the original customer, Captain Davenport.

In 1807 Gillows were described as being "among first grade manufacturers in London; their work is good and solid though not of the first class in inventiveness and style". In Lancaster similar comments were made. "Mr. Gillow's extensive warehouses, stored with every article of useful and ornamental mahogany furniture, are well worth the attention of strangers, as they are said to be the best stocked of any in this line, out of the metropolis". Both these comments reflect the demands of the solid, middle-class customers who were the mainstay of the Gillow business.

Although these favourable comments might have been encouraging, by the beginning of the 19th century trade was poor, particularly as the West Indies trade, which had been a mainstay of the business, declined rapidly. With the firm under new management from c.1814, they turned their attention to developing other parts of the trade, particularly commercial and institutional customers. Among many important commissions, the supply of furniture for the New Palace of Westminster was perhaps the most important. Indeed during the 1840s Gillows worked with Pugin furniture designs, many of which were to be reused for years to follow.

Gillows were represented at the 1851 Exhibition, and in 1863 they received the Royal Warrant as cabinet-makers to the Queen. Their involvement with exhibitions continued, and at the 1872 London International Exhibition they showed an oak sideboard (*Pet*) designed by Bruce Talbert, and a cabinet for display of Doulton reliefs designed by Charles Bevan. Talbert also designed a folding chair for the firm (c.1873) that remained available for some years. Other important designers associated with Gillows include T.E. Collcutt and E.W. Godwin.

In a vein similar to but less exalted than the Houses of Parliament contract, they also supplied furniture and fittings for work for the other Houses of Parliament (Cape Town), the new Law Courts, the St. Pancras hotel and other Midland railway hotels. They became important contractors for government buildings, museums, and exhibitions world-wide includ-

ing work in Australia, India, the United States, Russia, Germany and France.

Despite the involvement of important contemporary designers, the 19th century middle-class taste for reviving designs, such as the Regency revival, meant that Gillows, with their retrospective records were well placed to meet the demand.

Although Gillows took over the bankrupt firm of Collinson and Lock in 1897, and had diversified into other work, including the fitting and furnishing of luxury yachts and ships (e.g., the Royal yacht *Victoria And Albert*, and Tsar Alexander III's yacht *Livadia*), there were financial problems. In 1903 a casual business partnership with the firm of S.J. Waring became official through takeover and the Waring and Gillow business was established.

In the 20th century the new business extended its manufacturing work to furniture and ship fitting as well as developing a retail business. The business of fitting out liners such as the *Lusitania*, *Caronia*, and *Queen Mary* cushioned the firm against the worst effects of the Depression. In 1906 Waring and Gillow opened a retail furniture store in Oxford Street, London and they had soon built up a reputation for high quality furnishing and interior decoration. A rather conservative initial approach to design was complemented by the founding of a Modern Art Department for the store in 1928. This was an important landmark in 20th century interior design. The appointment of Serge Chermayeff as director was perceptive, while a similar venture was being opened by Gillows in Paris under the direction of Paul Follet. Follet designed the Waring and Gillow exhibit at the 1929 Salon des Artistes-Décorateurs.

In 1932 another financial collapse led to a restructuring, but in 1953 the business was finally taken over and broken up, and in 1962 the Lancaster workshops were closed, effectively bringing to an end a remarkable enterprise.

CLIVE D. EDWARDS

Selected Works

The Gillow Archive, containing day-books, sales ledgers, order books, estimate sketch books, accounts and correspondence, is held by Westminster City Library, London. Additional collections of designs are in the City Museum and Art Gallery, Lancaster, and the Victoria and Albert Museum, London. Examples of Gillow furniture survive *in situ* at Tatton Park, Cheshire; Workington Hall, Cumbria; and Broughton Hall, Yorkshire.

Interiors

- 1771 Heaton Hall, Lancashire (furniture)
- 1786-90 Farnley Hall, Otley (furniture)
- 1788-89 Workington Hall, Cumbria (furniture for the dining room, hall, and billiard room, and some upholstery): John Christian Curwen
- 1810-12 Parlington Hall, Aberford (furnishings for bedrooms, library, dining room and study): Richard Oliver Gascoigne
- 1811-12 Tatton Park, Knutsford, Cheshire (furniture and upholstery for the library, bedrooms and dressing rooms): Wilbraham Egerton
- late 1840s Houses of Parliament and New Palace of Westminster, London (furniture)

Girard, Alexander 1907–1993

American architect, interior, furniture and textile designer

Although born in New York, Alexander Girard grew up in Florence, Italy where he acquired the informal first name of "Sandro". He was trained as an architect in London at the Architectural Association, graduating in 1929 and winning a Florence Traveling Scholarship. He established an office in Florence but gave it up to take up further study at the Royal School of Architecture in Rome graduating there in 1931. He returned to New York and maintained an architectural office there from 1932 to 1937 when he moved to Detroit, where he practised architecture and interior design and operated a retail showroom. In 1947 he moved his office and showroom to the wealthy suburb of Grosse Pointe, Michigan where he also designed his own spacious and comfortable house, remarkable for an interior using strong color tones of orange, yellow, blue, magenta and purple along with thoughtfully displayed objects from his growing collection of folk art. Objects from Mexico and South America, paper kites and Victorian decorative objects contributed to the overall effect.

In 1943 Girard was the designer of a cafeteria for the International Detrola Corporation in Detroit and also worked for a time as an industrial designer for that firm. His Detrola table radio was one of the first radios to escape from the habit of disguise in anachronistic cabinets based on historic (often Gothic) furniture. In 1946 he was the interior designer for several projects including offices and a cafeteria for the Ford and Lincoln motor companies in Detroit.

He was associated with the architect Eero Saarinen on several projects including the General Motors Research Center in Detroit, the Irwin Miller residence in Columbus, Indiana and was a member of the winning team in the competition for the St. Louis Memorial, which was ultimately built as a great arch gateway to the American west on the bank of the Mississippi River. Other clients included the Cummins Engine Company of Columbus, Indiana, John Deere Co. (for an historic exhibit at their corporate offices) in Moline, Illinois, and the Detroit Institute of Arts for the 1949 exhibit *For Modern Living*. Girard became known for a number of exhibit designs including *Design for Modern Use, made in U.S.A.* (1950), *Good Design*, (1954), *Textiles and Ornamental Arts of India* (1955), all at the Museum of Modern Art in New York, and the traveling exhibition *Nehru: His Life and His India* (1965) designed in collaboration with Charles Eames.

Girard's relationship with Eames, established during his Detroit years while Eames was at Cranbrook Academy, near Detroit and the subsequent relationship with George Nelson, the Design Director for Herman Miller, the leading American maker of modern furniture, led to Girard's 1952 appointment as the Design Director of a textile division established by Herman Miller. The three designers worked together as a team to shape the design philosophies and policies of Herman Miller, forming what came to be regarded as a prime example of the role that outstanding design can play in the success of a manufacturing firm.

Girard's efforts in finding sources and directing the development of lively color and strong, generally geometric pattern made the textiles offered by Herman Miller unique in their color and variety. He was also the designer of showrooms for Herman Miller in Grand Rapids, Michigan and in San Francisco. In 1953 he moved to Santa Fe, New Mexico and built there an office and residence that became a showcase for his colorful folk art collections that eventually grew to include some 100,000 objects, now held by the Girard Foundation.

In 1961 he was responsible for the establishment of a retail shop in New York known as Textiles and Objects (T & O) which featured his fabric designs along with many small decorative objects that reflected his interest in folk art. He continued an interior design practice with commissions for restaurant design that included the New York restaurants of La Fonda del Sol (1960, with a South and Central American theme) and L'Etoile (1966, with a French theme). Girard's restaurant projects included, along with interior design, development of related graphics, table settings, and small details down to the ash trays and matchbooks.

In 1965, Girard took over all visual design for Braniff International airlines and designed all their airport facilities, graphics, and aircraft interiors. His aircraft color schemes, which involved painting the planes in unconventional bright solid colors (such as yellow, pink and violet), were both star-

ting and spectacular. For Braniff, he designed a complete line of furniture for use in interiors which was then introduced as part of the Herman Miller furniture product line in 1966. Although spectacular and colorful, this product group did not achieve commercial success and was withdrawn after a short time.

Girard was the recipient of many honors and awards including an honorary Royal Designer for Industry diploma from the Royal Society of Arts, London (1965) and a gold medal from the American Crafts Council (1985). Girard is now best known for his role as a colorist and for his development of varied and imaginative decorative patterns. Girard's folk art collection now occupies a wing of the International Folk Art Museum in Santa Fe.

JOHN F. PILE

Biography

Alexander Hayden Girard. Born in New York City, 24 May 1907. Studied at the Architectural Association School, London, 1925–29; Royal School of Architecture, Rome, 1930–31; New York University, 1932–35. Employed in several architectural offices in Rome, Florence, London, Paris and New York, 1929–32; active as an independent architect and designer in Florence, 1930, New York, 1933–37, and Detroit, 1937–52; settled permanently in Santa Fe, New Mexico, 1953. Design director, textile division, Herman Miller Inc., Zeeland, Michigan, from 1952. Active as a designer of exhibitions from late 1940s. Established Girard Foundation for collections of toys and folkcraft objects, Santa Fe, 1961; donated to the State of New Mexico, 1978; opening of the Girard Wing of the Museum of International Folk Art, Santa Fe, 1982. Received numerous prizes and awards including Medal of Honor, American Architectural League, New York, 1962 and 1965; Elsie de Wolfe Award, American Institute of Interior Designers, 1966; Allied Professions Award, American Institute of Architects, 1966; and Gold Medal, American Crafts Council, 1985. Honorary Royal Designer for Industry, Royal Society of Arts, London, 1965. Died in Santa Fe, 1993.

Selected Works

Examples of Girard's textiles and furnishings are in the Museum of Modern Art, New York. His collection of children's toys and folk art is in the Museum of International Folk Art, Santa Fe.

Interiors

- 1930 G. Uzielli Apartment, Florence, Italy (interiors)
- 1946 Ford Motor Company, Dearborn, Michigan (office interiors)

Giulio Romano (Giulio Giannuzzi) c.1499–1546

Italian painter, architect and designer

The pupil of Raphael, inheritor of his studio and the only influential artist of his period to be born in Rome, Giulio Romano created some of the most memorable and important decorations of his time and occupies a central position in Renaissance interior decoration of the first half of the 16th century.

Born some time between 1492 and 1499, Giulio was immersed in the material and historical fabric of Rome from the very beginning of his life. He grew up surrounded by visual stimuli; even the street on which he was born was overshadowed by one of the most significant of the city's monuments, Trajan's column. And the nationalistic, political upheavals that dominated the first few years of the century – namely the declaration of the Roman Republic in 1511 and the expulsion of the French in 1512 – must have influenced his attitude towards the vast, decaying monuments of ancient Rome. The juxtaposition of ancient and modern buildings which characterised the city's appearance during this period is later reflected in his startling decorative schemes, particularly in the Palazzo del Te.

Giulio Romano's training under Raphael not only established his credentials as an artist, they also enabled him to develop his own artistic ideas. The *Battle of Constantine* fresco

(1520–21) for the Sala di Constantino in the Vatican is an example of Raphaelian ideas translated into Giulio's style which, in turn, was derived from Roman sarcophagi reliefs. Unlike most other Italian artists of this period, including Raphael, Giulio's interest in Roman Antiquity can be traced to specific Roman sources. And as the more flamboyant Mannerist style began to take root, especially in Florence, Giulio's own brand of Mannerism was based in Roman Classicism. Roman Classicism also appealed because of its formality. The Villa Lante, built for Baldassare Turini da Pescia c.1523, demonstrates a lightness and simplicity of design which are indebted to formal classical design solutions.

In October 1524 Giulio left Rome for Mantua to work for Duke Federico II Gonzaga. Mantua was a city of 40,000 inhabitants and was both prosperous and politically strategic. Federico was extremely ambitious and instituted a programme of building that would reflect the wealth and importance of the city. Giulio was offered overall control of this programme and the prospect of unprecedented artistic freedom and power no doubt strongly influenced his decision to work for Federico.

Giulio's most famous commission for the Duke was the Palazzo del Te (1526–31). The resulting decoration reflects not only the ambitions of his patron and the Gonzaga family but also those of Giulio himself. No area is left undecorated and the effect is a sumptuous display of gold, colour and marble and an overwhelming affirmation of Ducal wealth.

There were two phases of decoration. The first, carried out between 1526 and 1529, was the decoration of the north-east apartment and the Sala di Psiche. Based on the story of Cupid and Psyche, the scheme is dominated by a fresco of the marriage ceremony, while two windowless walls are united by one continuous narrative of the wedding feast. In the second phase (1530–35), Giulio uses decorative schemes to emphasise the power and status of his patron. The walls are filled with representations of Roman triumphs and demonstrations of Olympian strength. In the Sala dei Venti, the Gonzaga badge, Mount Olympus, appears in the centre of the ceiling, and the room includes 16 medallions depicting scenes of hunting, fighting, and struggles between gladiators arranged under the twelve signs of the zodiac.

The Sala dei Giganti indicates the sheer scale of ideas and techniques that Giulio was capable of. There are no breaks between walls or ceiling and the scheme has no start or finish. Even the door has been painted out. The frescoes depict the battle between the giants and the gods as the giants attempt to storm Olympus. In a triumph of *trompe-l'oeil* painting, the dome appears to collapse as classical columns crash down upon the heads of the giants.

The decoration of Te was complemented by the work Giulio undertook between 1536 and 1540 redecorating the Palazzo Ducale in Mantua. Of particular interest is the Camerino degli Uccelli which displays grand design on a miniature scale. A mirror vault crowns an elaborate architectural scheme through which is woven an equally elaborate decorative scheme of classical architecture, putti, satyrs and beasts. Giulio continued to work on a grand scale in the Appartamento di Troia which was designed to house Federico's paintings by Titian.

Not all Giulio's decorative work comprised scenes of artful, yet meticulously contrived, frivolity and flattery. In 1540, Federico died and Giulio became painter to his brother,

Cardinal Ercole Gonzaga. This change of patron naturally led to a change of emphasis in thematic composition.

Giulio already had some experience of non-secular work. Around 1532 he had undertaken a commission to decorate the apse of Verona Cathedral. His painted an Assumption of the Virgin whose design was not dissimilar to that of his work in the Sala dei Giganti at Te. Indeed, so shocking were the twelve apostles that one contemporary observer railed against "the indecency of the caricature with which he portrayed those holy men". His work for Cardinal Ercole demonstrates a more serious approach, particularly in his work on the reconstruction of Mantua Cathedral (1544). And at San Benedetto Po the decoration is polychromatic with a restricted decorative scheme set within a geometric linear system.

Giulio Romano was the least derivative of all the Italian painters of the period. Despite, and perhaps partly because of his training under Raphael, he was a maverick artist whose originality of design reflects the relative independence allowed him by his tutor. He was a keen individualist who did not return the favour of artistic freedom to his own pupils. Instead he preferred glorious artistic isolation and the certainty of absolute artistic supremacy in Mantua.

Biography

Born Giulio Pippi in Rome c.1499. Apprenticed to Raphael as a young boy, working with him in the Vatican *Stanze* and loggias, c.1509–20. After Raphael's death he contributed to the interior of the Villa Madama in Rome, c.1520, and to the completion of the *Stanze*, until c.1525. Employed as architect, and designer of interiors, pageants and the applied arts for the Gonzaga family in Mantua, from c.1524. Became citizen of Mantua, 1525; appointed Vicar to the Court and Superior General of Gonzaga buildings and streets of Mantua (city architect), 1526. Married in 1529: 2 daughters and 1 son. Built his own house in Mantua from 1538. Died in Mantua, 1 November 1546.

Selected Works

- 1514–24 Vatican Palace, Rome (fresco decoration, Sala dell'Incendio and Sala di Constantino): Pope Julius II
- 1526–31 Palazzo del Te, Mantua (architecture and fresco decoration including the Sala dei Cavalli, Sala dei Giganti, Sala delle Aquile, Loggia di Davide, Sala di Psiche, Sala of Attilio Regulus, Loggia della Grotta, Loggia delle Muse): Duke Federico II Gonzaga
- 1530 Pageant for entry of Emperor Charles V to Mantua (painted decorations): Duke Federico II Gonzaga
- 1531 Pageant for marriage of Duke Federico II Gonzaga and Margherita Paleologo (painted decorations): Duke Federico II Gonzaga
- 1536–38 Cabinet of Caesars, Palazzo Ducale, Mantua (interior decoration, Appartamento di Troia): Duke Federico II Gonzaga
- 1538–44 Giulio Romano House, Mantua (building and interiors)
- c.1544 Palazzo Pippi, Mantua (building)
- c.1544 Cortile della Cavallerizza (building): Duke Federico II Gonzaga

Glasgow School

At the close of the 19th century Glasgow witnessed a distinctive flowering of the applied arts allied to a new emphasis on the design of artistic interiors. The Glasgow Style emerged initially at the Glasgow School of Art in the early 1890s and reached its peak around the turn of the century, before fading by 1910. This singular style is characterised by an economy of line and ornament and is inspired by natural forms; its sudden appearance in the "Second City" of the British Empire was all the more striking for its industrial and commercial context.

The pivotal figure of the Glasgow Style was the architect and designer Charles Rennie Mackintosh (1868-1928); he played a significant role in the invention of the style's distinct visual language. His interior design work gave real expression to the notion of the interior as a work of art. It was Mackintosh's Glasgow School of Art building, completed in

1899, that provided the inspirational setting for the emerging style. However, Mackintosh took almost no personal interest in the development of the broader Glasgow Style. He did not teach at the School of Art and his focus remained steadfastly on his own work. His contribution in the context of the School must be seen as part of a collaborative partnership involving his fellow students and friends Herbert MacNair and the two Macdonald sisters, Frances and Margaret. And the work of this group (The Four) itself should be considered in relation to developments in design instruction within the School.

In 1885 the appointment of Francis H. Newbery as headmaster gave a new emphasis to design instruction within the School of Art. His enthusiasm for the Arts and Crafts movement and background in teaching at South Kensington, allied to an enthusiastic support of individuality, underpinned his ambitions for the School. In 1893, the technical art studios were opened, offering courses in glass staining, repoussé, metal working, stone carving and book binding. As the decorative arts gained greater prominence, the first graphic works by The Four began to appear. Combining stylized plant and human forms to ambiguous and challenging effect, they were given an uncertain reception when first exhibited. By the middle of the decade, the Macdonald sisters, working in the new studios, had translated these graphic experiments into the applied arts, producing beaten metal candlesticks, mirror frames and sconces. If the establishment reaction to their work was occasionally hostile, the work of The Four clearly inspired their fellow students and laid the foundations for the Glasgow Style. With Newbery's encouragement the style rapidly became established within the School. A common linear quality appeared in the work of the decorative art studios with stylized plant forms, birds and butterflies becoming key motifs. The excesses of Continental Art Nouveau were avoided in favour of a tighter, sparer linear quality.

Although Mackintosh played a part in these developments, almost all of his own decorative art production was completed in connection with specific interior commissions. The Macdonald sisters were both full-time students at the School, while Mackintosh was an evening class student and working to further his professional architectural career. His contribution to the emergence of a Glasgow Style within the context of the Glasgow School of Art was not as significant as the part he played in the development of the Glasgow Style interior.

In 1896, the Glasgow tea room proprietor Kate Cranston opened her new premises on Buchanan Street. Tea rooms on Argyle Street followed in 1897. The interiors of both featured the work of Mackintosh and his contemporary, George Walton. For many Glaswegians and visitors to the city alike, these tea rooms were their only brush with the "artistic" Glasgow interior, and they had considerable impact. Walton had formed his company of Ecclesiastical and House Decorators in 1888. Through the early 1890s he had been working towards increasingly integrated interiors, expanding his firm's output from painting and paper hanging to include furniture, textiles, metalwork and stained glass manufacture. As the more experienced of the two, Walton was given overall responsibility for Buchanan Street. Mackintosh's contribution was limited to the provision of stencilling in the stairwell and two interiors. His uncompromising and symbolically-charged schemes did not sit altogether happily with Walton's more

Glasgow School: design for a bedroom by George Logan, c.1904

conventional work. At Argyle Street, Walton again retained overall control while Mackintosh designed all the furniture. These interiors were some way short of absolute stylistic unity, but the work of the two designers did display a common freshness and originality and, in the interiors designed by Walton alone, demonstrated what could be achieved by giving a single designer responsibility for every aspect of an interior design.

The tea rooms were Walton's last major contribution to the Glasgow scene. He had departed for London before the completion of Argyle Street. Mackintosh was left to take centre stage. In 1898 he designed his first white domestic interior at Westdel, a house in Queen's Place, Glasgow. One of the beautifully executed drawings for the scheme was shown in Glasgow the following year, and its exhibition was followed by a number of Glasgow designers exhibiting scenes for interiors which were self-consciously artistic in style: none more so than George Logan's fairy-tale interiors. Logan was chief designer for the Glasgow furnishing firm of Wylie and Lochhead, and it was this firm which attempted to harness the new style to more commercial ends.

At the Glasgow International Exhibition of 1901, the firm commissioned a pavilion containing three interiors, each designed in its entirety by one of their designers. Logan contributed the library, E.A. Taylor the drawing room and John Ednie the bedroom. None of these designers is known to have undertaken a complete interior scheme before this date and the opportunity to do so now must have sprung from Wylie and Lochhead's ambition to be seen at the forefront of modern interior design and to capitalise on the growing reputation of the Glasgow Style work being produced at the School of Art. The designers involved would certainly have been aware of Mackintosh's increasingly sophisticated interior schemes produced around 1900, evidenced in the deliberate

arrangement of the furniture and the "tendency towards the straight up" in the design of the furniture itself, while the colour schemes of greens, pinks and purples link them to the earlier Cranston tea room schemes.

Wylie and Lochhead did not require their customers to commission complete interiors. The commissions that they did undertake following the exhibition were more piecemeal, with the existing possessions of the client often competing with the introduction of a new stencilled frieze or suite of furniture. The Glasgow Style interior on Mackintosh's rigorous model failed to materialise in any quantity in the city. Ironically, one of the most complete of the post-exhibition Wylie and Lochhead interiors was completed not in Glasgow but suburban Birmingham. Mackintosh alone developed a sufficiently sympathetic, if limited, set of clients to allow him to produce interiors that were in themselves works of art. But by 1910, Mackintosh was nearing the end of his productive years in Glasgow. Two of the three designers responsible for the Wylie and Lochhead exhibition rooms had left the company, while at the Glasgow School of Art the vigour and invention that had been so much a part of the early Glasgow Style had been dissipated. The Glasgow Style, it seems, ultimately promised more than it achieved.

Gobelins Tapestry

French tapestry workshop; established 1663

The village of Gobelins, on the outskirts of Paris, derived its name from the Jean Gobelin family of scarlet-dyers who established a workshop there c.1440. A tapestry workshop was established in the Boulevard St. Marcel close to the old dyeworks in 1607 by two Flemish weavers, François de la Planche of Oudenarde and Marc de Comans of Antwerp. They took over the property of the Gobelins family and their Italian associates, the Canayes. These workshops were purchased on behalf of King Louis XIV in 1662 by the finance minister Jean Baptiste Colbert, in order to establish the Manufacture Royale des Meubles de la Couronne (Royal Factory for the Furnishings of the Crown) to make furnishings for the king's palaces. Charles Le Brun, artistic director of Nicolas Fouquet's Maincy tapestry workshop at Vaux-le-Vicomte was appointed artistic director in 1663. Le Brun's principal task was to produce designs for tapestries and other types of furnishings and have them executed correctly.

In 1667 the Gobelins workshop was organized under letters patent incorporating it as the Manufacture Royale des Gobelins. Approximately 250 craftsmen including tapestry weavers, painters, bronze workers, furniture makers, and others were employed to provide furnishings for the royal residences, particularly the Palace of Versailles. The Gobelins tapestry workshop became the most important of its time.

The tapestry workshop had one low-warp and three high-warp workshops. From 1665 onward the factory had its own dyeworks using mainly vegetable dyes with mineral mordants. The weavers and their families lived in houses with gardens, an arrangement that lasted until the 20th century. Apprentices were given instruction in drawing before they began to specialize. They could become master-craftsmen after a six-year apprenticeship and four years of service.

Weavers in the Gobelins workshops had more freedom in executing designs with regard to choice of color than had been usual in Renaissance workshops. Le Brun made his designs in

oils specifically for tapestry in the classical Baroque style, and did not attempt to copy paintings. He had a large team of painters who prepared cartoons and models. Each painter had his own specialty and worked on specific elements of the design such as architectural subjects, animals, or scenery.

In 1664 the first tapestries, a set of portières, *The Fames* and *Mars* originally started at Maincy, and *The Acts of the Apostles* from cartoons by Raphael, were completed. That Le Brun was well acquainted with the Italian style is evident in *The History of Alexander*, a series with wide, intricate borders and a large range of colors.

Until the year 1683, multiple copies were made of each set of tapestries produced at the Gobelins workshops so they could be sent as royal gifts to other European countries. These were intended as propaganda to impress other rulers with the greatness of the king. For twenty years the major part of the resources of the manufactory were used exclusively for this purpose.

Colbert died on 6 September, 1683, and his successor, the Marquis de Louvois, kept Le Brun, who had fallen from royal favor, nominally in charge, but the Controller of Buildings, M. de la Chapelle-Bessé, took over actual direction of the workshop. The old spirit of grandeur and opulence was replaced by one of economy. Work was stopped on *The History of the King*, a series of fourteen tapestries based on the life of Louis XIV designed by Le Brun and begun in 1665, which required a great deal of gold thread. A set of these is now in the Mobilier Nationale in Paris. The weavers turned to copying master painters, notably Raphael, Giulio Romano and Nicolas Poussin.

Le Brun died in 1690 and was succeeded by the painter Pierre Mignard, who himself died in 1695. Mignard changed the role of Gobelins tapestry from historical and political display to one of entertainment and amusement, using pleasant themes and fables.

From 1694 to 1699 the Gobelins workshops were closed down because of the exhaustion of the royal treasury as a result of the War of the League of Augsburg. After reopening in 1699 they produced only tapestries. Following the reopening, the workshop was under control of the Superintendent of Buildings with an artistic director in charge of design. These included Robert de Cotte, 1699–1735; Jean-Baptiste Oudry, formerly director of the Beauvais factory, 1736–55; François Boucher, 1755–70; and Noël Hallé, 1770–83. Oudry's chief interest was in "verdures", or landscape themes based on nature. He insisted on exact reproduction of the artists' cartoons, a policy that caused great conflict with the weavers who considered it a prerogative of their craft to interpret designs in their own way, as they had previously. The weavers gave in, but the conflict continued until Oudry's death in 1755.

Gobelins tapestries in the 18th century were intended to please the elegant society of the day. *Scenes from Opera*, *Tragedy and Comedy* and the *Gods' Sequence* were the most notable. With the weaving of *The Story of Don Quixote* after a design by Charles-Antoine Coypel in 1714 the center scene of the tapestry was reduced in size, and an elaborate *alentours*, or decorative border, was introduced. The *alentours* simulated a damask panel with garlands, ribbons, birds, etc., and came to fill a major part of the tapestry. *The Gods* set by Boucher begun in 1758 with *alentours* by the flower painter Maurice

Gobelins Tapestry: Louis XIV visiting the workshop, c.1644

Jacques was the finest of this type. Leading French painters provided cartoons, but the tapestries again had to compete with oil paintings for wall space. By the 1770s the Gobelins workshop was making pastoral scenes for furniture upholstery in order to compete with Beauvais, which had increasingly focused its production on furniture covers.

Under the director of the dyeworks, Jacques Neilson (director 1768–84), the color range of dyes was increased by use of fugitive vegetable dyes in order to reproduce the colors of oil paintings. Neilson was head of the low-warp factory and introduced this and other technical improvements to obtain higher quality and fidelity of reproduction without increase in cost. Unfortunately the dyes on surviving tapestries have faded badly.

In the 1770s the factory adapted its production to Neo-Classicism under the painter, Pierre-François Cozette. The factory closed temporarily in 1793 and was reorganized in 1794 following the French Revolution. The Comité de Salut Public (Republican Committee of Public Safety) examined the subjects of tapestries in production, condemning 120 as reactionary and 136 as frivolous. Many residences and public buildings were sacked by the revolutionaries, and their tapestries destroyed.

Napoleon's government in 1805 instructed the Gobelins workshop to choose subjects from the history of France, particularly from the Revolution, and increase production to furnish the imperial palaces. Several sets on Napoleonic themes were executed from 1806. Director Charles-Axel Guillaumot introduced chemical dyes, again increasing the color range to

match that of paintings. These colors were also subject to fading. Chevreul, director of the laboratory from 1824 to 1889, developed 14,400 shades of silk that enabled the weavers to make faithful copies of paintings by old masters and contemporary artists such as Ingres and Horace Vernet. Throughout the 19th century and on until the 1940s the Gobelins tapestries were copies of every type of painting.

During the Second Empire of Napoleon III, from 1852 to 1870, the Gobelins workshop again served as a factory for the production of tapestries for the imperial residences. The factory was nearly ruined by fire in the 1871 insurrection of the Commune of Paris and the fall of the Second Empire, but it survived and continued producing historical tapestries. Jules Guiffrey, the administrator and artistic director from 1885 to 1908, tried to revive interest in tapestries by changing designs from copies of paintings to something more appropriate to the tapestry medium, but he was unable to convince the cartoon artists and dyers to accept this. In 1911 Gobelins gave up the use of natural colors and adopted bright colored synthetic dyes based on anthracene that proved even more fugitive. Director Gustave Geffroy's finely detailed copies of Impressionist paintings have all faded to dull greys and wine tints. The factory returned to natural colorfast dyes in 1939.

The Gobelins and Beauvais workshops amalgamated into the Manufacture National de Beauvais aux Gobelins in the 1930s. Since 1937 the Gobelins factory has been a branch of the Mobilier National and works only for the French government, producing tapestries for government buildings.

Gödöllő Colony

One of the more far flung reaches of English Arts and Crafts influence was the colony which formed at Gödöllő, to the north of Budapest in Hungary, at the beginning of this century, where a group of artists, craftsmen and craftswomen gathered to form the Gödöllő Workshop.

Aladár Körösfői-Kriesch, a painter and designer, had moved to Gödöllő with his family in 1901. In 1904 the Ministry of Culture donated the looms of a bankrupt weaving factory and charged him with reviving the skill of weaving in Hungary by setting up a school of weaving. The graphic artist and designer Sándor Nagy, who moved there in 1907, was joined by others, including workers from the weaving factory. Traditional techniques were revived and only natural dyes were used. As well as carpets and tapestries, the Workshop soon expanded to produce embroideries, frescoes, furniture, leatherwork, ceramics, mosaics and stained glass. Other artists involved included Leo Belmonte, Rezho Mihály, Laura Kriesch, Jenő György Remsey, István Zichy, Mariska and Carla Undi, Árpád Juhász, Ervin Raáb and Endre Freckai. Some were primarily painters rather than designers, and there was also a school of sculpture, directed by Ferenc Sidló. Also associated with the colony were the architect István Medgyaszay and the designer turned architect, Ede Thoroczkai Wigand. Medgyaszay built studio houses for Sándor Nagy and Leo Belmonte in Gödöllő. The Workshop rapidly achieved national and international success, through displays at exhibitions. This resulted in commissions for fittings and furnishings for several major architectural projects in the period up to World War I. These included the Nemzeti Salon, an exhibition hall of 1906–07, and the Academy of Music, 1907, both in Budapest, and the Cultural Palace of 1912, in Marosvásárhely (now Tîrgu Mures in Romania).

In wishing to revive the unity of art and life, while combining strong spiritual beliefs with social conscience, the members of the Gödöllő Colony were heavily influenced by the writings of John Ruskin and William Morris, as well as Nietzsche and Tolstoy. Ideas of the value of community spirit and of the simple life had become increasingly popular across Europe,

particularly in artistic and intellectual circles. Körösfői-Kriesch wrote a book on Ruskin and the Pre-Raphaelites, in 1905, *Ruskinról és az angel praerafaelitekről*, and said that “most art is to be found where art encounters life, in the spirit of Ruskin”. Emphasis was therefore put on the applied arts and on integrating all the arts to create the *gesamtkunstwerk*. Living in such an environment would then further encourage a productive and fulfilling existence.

In Hungary at the beginning of the 20th century, this idealistic and philosophical approach coincided with both a political desire to find a means of expressing a national identity – as in many other European countries around this time, Finland for example – and a social policy to revive cottage industries and improve the lives of the rural peasantry. Their ability to find a combined solution to these various needs accounts for the success of the Workshop. The Gödöllő circle placed more emphasis on their social role than the Wiener Werkstätte or the Deutscher Werkbund, their nearest equivalents at the time, and were possibly more successful in achieving their social aims than Morris. They involved the wider community by providing training in craftwork and by employing local people in the workshop. However they did not always aim to achieve the Arts and Crafts ideal of the unity of designer and maker.

In their own work they combined motifs and patterns from Hungarian folk art with myths and fairy tales. They studied regional art and architecture and collected examples of folk art. They also popularised the use and display of such work in interiors. Thoroczkai Wigand created a museum of Székely folk art in his flat in Buda and Körösfői-Kriesch contributed an article on peasant art to the *Studio* magazine of 1911. The folk arts of the various Hungarian regions had been studied and indeed exhibited throughout the world from the 1850s onwards, but were only now seen as “art” and as exemplifying the ethical value of integrating art into the everyday life of local communities.

In deriving from a tradition which predated industrialisation and the pervasive influence of the Austro-Hungarian Empire, these arts had symbolic value in reflecting the origins of the Hungarian people and were seen as a valid source for a new national style. Carved and flower-painted beams and furniture, wooden columns with carving derived from Transylvanian grave posts, curtains and carpets with stylised patterns, all showing the influence of folk art, can be seen in the interiors of the studios of Körösfői-Kriesch and Sándor Nagy of 1905. Nagy's studio was exhibited at the 1905 Art Lover's Exhibition, with another version as “The Home of an Artist”, shown to great acclaim, at the Milan International Exhibition of 1906. Here the interior was designed by István Medgyaszay with a beamed ceiling and carved wooden columns and balustrade. The furniture was by Sándor Nagy and embroideries by Laura Kriesch.

The series of frescoes by the Gödöllő master Mariska Undi in the Népszálló, or People's Hotel in Budapest, of 1911, shows scenes of peasant life in the various regions of Hungary, including many examples of folk art and costume. In Gödöllő tapestries and stained glass, patterns and motifs abstracted from peasant carvings and embroideries were often combined with figurative subjects. These might portray actual peasant life, shepherds and women in national dress (Körösfői-Kriesch's *Women of Kalotaszeg* tapestry of 1908), or be based

Gödöllő Colony: design for a Home of the Artist, 1906 Milan Esposizione Internazionale

on myths of the origins of the Hungarian people. The latter show heroes such as Attila the Hun or depict Hun-Magyar stories such as *The Hunt of the Magic Deer* or the life of Toldi, a popular hero, from the poems of János Arany (tapestry by Sándor Nagy of 1917). In many examples, such as Nagy's stained-glass window for the Hungarian Exhibition Hall at Venice (1909) with its reconstruction of the wooden palace of Attila the Hun, ancient heroes were shown wearing Transylvanian costumes or living in Kalotaszeg or Székely houses, or sometimes incorporating Transdanubian (another region of Hungary) elements in the architecture. Such subjects were already popular in the fine arts but depicted in a more realistic, historicist style than the stylised, decorative approach used by the Gödöllő designers. As many of the original myths had Asian and even Mughal sources, Islamic motifs, already prevalent in Hungary from the years of Turkish rule and preserved in folk art, were a strong additional design influence. This can be seen, for example, in Körösfői-Kriesch's decoration of the vaulted entrance hall of the Marosvásárhely Cultural Palace.

The combination of these exotic and vernacular sources, together with the international influence of Art Nouveau, gives a unique flavour to the best work of the Gödöllő designers. While some of their work shows strong medievalising tendencies, in other examples, such as the Academy of Music interiors, the Art Nouveau or Jugendstil element is more evident. Here the Körösfői-Kriesch murals show the Viennese influence of Klimt, as does the geometric gold ornamentation of the rest of the interior. Other works by Körösfői-Kriesch, such as the mosaic fountain depicting *The Siege of Aquileia* in the Hungarian Pavilion at Venice of 1909 and his mosaic for the Mexican National Theatre of 1908–21, show similar geometric influence. Such influence was of course evident in Hungarian Art Nouveau interiors of the period, and as other artists were often involved in these commissions as well as members of the Gödöllő Workshop, their work was often only a part of the overall result. In some of Körösfői-Kriesch's painted figurative panels and the work of Sándor Nagy generally, there is less Jugendstil influence and a more lyrical feeling, comparable to English Pre-Raphaelitism and Arts and Crafts

designs. This is particularly true of Nagy's stained glass such as the *Kisfaludy* panel of 1907 and the series of windows he designed for the Cultural Palace at Marosvásárhely, of 1912, carried out by Miksa Róth whose studio worked on most of the stained glass and glass mosaics designed by the Gödöllő Workshop. The subjects of these windows were taken from Székely folk ballads, including one showing Kata Kádár, a Hungarian Ophelia, mixing Christian symbols with pagan and magical elements. Their strong compositions and intricate designs, making much use of leading and jewel-like colours, combined with their symbolic content make them some of the most effective work of the Gödöllő Colony, as is the Cultural Palace as a whole.

Sándor Nagy had earlier designed a window, *Hunting Gentry*, for the theatre at Vezsperm by Medgyaszay of 1907, in a lighter style with more clear glass, which combined with the simplicity and general lightness of the interior does seem more modern in design than the later but more archaic and medieval Cultural Palace. Nagy's later work in the 1920s for public commissions became increasingly academic. He remained in Gödöllő, and took charge of the weaving workshop after Körösfői-Kriesch died in 1920, although the rest of the workshop closed down. The outbreak of World War I had put an end to commissions and some members had already moved on.

Godwin, E. W. 1833–1886

British architect, furniture, interior and theatre designer

The intimate of J.M Whistler and Oscar Wilde, E.W. Godwin was one of the most successful and innovative architects and designers of his generation. A key figure in the development of late 19th century Aestheticism, he pioneered the use of Anglo-Japanese styles in decoration and furniture design and created interiors that were remarkable for their subtle blend of colours and their simple, uncluttered lines. He was also one of a small group of Victorian designers whose work was admired abroad. His designs for furniture, in particular, were frequently copied in the United States and he exercised an important influence on progressive Austrian and German taste. More recently, he has been hailed as a forerunner of Functionalism, and his emphasis upon form rather than ornament or style prefigures many of the ideas associated with the Modern Movement.

Godwin's early work was executed in a fairly conventional Ruskinian mode and the commissions for Northampton (1861) and Congleton (1864) Town Halls represent successful, if not wholly original, exercises in the popular Italianate and French Gothic styles. By the late 1860s, however, he had begun working in a much more independent and eclectic manner. This development was mainly due to his growing appreciation of Japanese art, an enthusiasm that, in time, was to have a decisive influence on every aspect of his work. He had begun collecting oriental china in the 1850s and shortly afterwards he reputedly became the first person in England to decorate his home in a Japanese way. The walls of his Bristol house at 21 Portland Square were painted in plain, pale colours and hung with Japanese prints, while his collection of blue and white vases stood on straw matting that covered the floors. An interest in Japonisme is also evident in his work for the Earl of Limerick at Castle Dromore, Co. Limerick (1866–73). While the exterior of this building was still strongly medieval in appearance, the interiors, for which Godwin designed the decorations and much of the furniture, contained elements that were far more radical. A scheme for the drawing room includes a frieze of fruit trees and female figures dressed in kimonos, alternating with panels of William Morris's *Trellis* wallpaper, above a plain, sage-coloured wall. Other rooms were painted in shades of pale peach, soft blues and grey and the furniture included chairs made in oiled wainscot oak, that were upholstered in natural calf decorated with simple embossed roundels of Japanese origin.

The influence of Japanese sources is even more pronounced in the furniture that Godwin produced for his London chambers in 1867. He described this work as an attempt to design pieces "by the grouping of solid and void and by more or less broken outline". The result was a collection of strikingly minimal buffets, tables and chairs whose highly rectilinear appearance was inspired by the example of the domestic fittings and woodwork illustrated in Japanese prints. Each piece was constructed on the basis of a symmetrical arrangement of straight vertical and horizontal lines. Surface decoration was kept to the bare minimum and was confined to panels of embossed leather paper and geometric, incised gold lines.

Godwin's earliest furniture was made in ebonised deal. Later, polished walnut and mahogany sometimes replaced the

Godwin: design for sideboard, c.1870

ebonized finish and his furniture of the 1870s and 1880s illustrates a move away from the strict vertical and horizontal emphasis towards more attenuated, curving lines. By this time, Godwin was working in a variety of styles. The celebrated *Butterfly Cabinet* (1877), which formed the centrepiece of the Collinson and Lock display at the 1878 Paris Exposition Universelle, designed in collaboration with J.M. Whistler, has much in common with the popular Queen Anne style, while a catalogue of Godwin's work published by the cabinet-maker William Watt (1877) includes examples of Greek, English Renaissance and Egyptian-style furniture alongside his favourite Anglo-Japanese. The eclecticism of this approach is perhaps characteristic of 19th-century attitudes to design. But, unlike his contemporaries, Godwin never attempted to reproduce period styles exactly and his work is remarkably free of the historicism that dominated the age. Moreover, his commitment to functional simplicity resulted in light and economical designs that, beside the elaborately carved and excessively ornamented furniture produced by the majority of mid-Victorian commercial firms, appear remarkably unfussy and restrained.

Godwin's work was much in demand among the more Aesthetically-inclined residents of fashionable areas such as Chelsea, Hampstead and Bedford Park and through his writings and his furniture he did much to foster a more self-consciously artistic approach to the decoration and furnishing of the upper-middle-class home. From the 1870s he was also devising complete interior schemes. In several of these he was responsible for not only designing the furniture and wallpapers and mixing the paints but also for supervising every detail of the contents right down to the pictures and tableware. Sadly, none of these interiors survives, but his notebooks record

features such as Japanese-style overmantels and wall-treatments. Many of his other commissions came from friends, and his clients included the actress Lily Langtry, the Countess of Lonsdale, and the sculptor Princess Louise. The climax to his career, both as architect and decorator, came with the series of artists' studio-houses that he built in Tite Street, Chelsea, between 1877 and 1879. These included Whistler's White House and a studio home for the painter Frank Miles. The latter house contains a large recessed inglenook and an elegant staircase whose open fretwork balustrade and brass-capped finials recall the Oriental-style furniture with which Godwin was involved at the time. A number of his interiors were reviewed in the press and, judging from contemporary descriptions, their appearance was markedly artistic and evoked an atmosphere of spaciousness and calm. Godwin's own home at Taviton Street (1874) exemplifies the simplicity of his style. The walls were painted subtle shades of yellow, cream and grey, Japanese matting covered the dado and the floor, the furniture was light and undecorated, and the soft, cretonne draperies hung in loose, elegant folds. Such artful economy was almost unheard of and comprised a radical alternative to the density of pattern and furnishings that was normally to be found in late Victorian rooms.

The interiors devised for Oscar Wilde, the high-priest of Aestheticism, represent a fitting end to Godwin's involvement in this field. On this occasion Godwin was not responsible for the structure, but he designed some items of furniture and all the decorations, over which he took enormous care. The project also demonstrates the important role that colour played in his work. With the exception of the Japanese leather papers used in the drawing room, wallpapers were eschewed and each room had its own combination of softly harmonizing paint hues. The dining room was painted with variations on enamel-white and contained a suite of Godwin's Greek-style furniture over which Wilde enthused, "each chair is a sonnet in ivory, the table is a masterpiece in pearl". The drawing room was gold and the entrance hall was grey and white. Upstairs, the colour combinations included pink with apple-green, and dark blue with pale blue-green. Such attention to detail exemplifies the Aesthetic quest for beauty, and the house epitomised the ideal of the "House Beautiful" to which the more committed adherents of Aestheticism aspired. What also makes these and Godwin's other interiors so unusual is their delicacy and clarity. It is frequently said that the Aesthetic Movement ushered in a taste for pale colours and emptier rooms but more often than not artistic interiors were strongly patterned and just as densely furnished as their more conventional counterparts. In Godwin's work, by contrast, there is a real attempt to create interiors that were light, convenient and uncluttered. This endeavour was little short of revolutionary.

Biography

Edward William Godwin. Born in Bristol, 26 May 1833. Articled to William Armstrong, city surveyor, architect, and civil engineer, Bristol. Married 1) Sarah Yonge, 1859 (died, 1865); lived with the actress Ellen Terry, 1868-75, one daughter and one son, the theatrical designer Edward Gordon Craig; married 2) Beatrice Philip, 1876,

1 son (Beatrice Philip married the painter James McNeill Whistler, 1888). Established own architectural practice, c. 1854; received first commission, c. 1855; made successful town hall competition designs for Northampton, 1861, and Congleton, Lancashire, 1864; in architectural partnership with Henry Crisp of Bristol, 1864-71: opened London office of Godwin & Crisp, 1865; established Art Furniture Company to manufacture his designs for furniture, 1867 (company failed, 1867); from 1867 designed furniture, tiles, pottery, fabrics, wallpapers, and stained glass for several British firms; main interior designs from mid-1870s; from 1880 worked increasingly on design of costumes and sets for the theatre; consultant on historic dress, Liberty's department store, 1883. Regular contributor of articles on furniture and interior decoration to the *Architect* and *Building News*, both London, from 1867; prolific writer on subjects such as historical architecture, Shakespeare, and dress reform. Exhibitions (furniture): Universal Exhibition, Vienna, 1873; Centennial Exhibition, Philadelphia, 1876; Exposition Universelle, Paris, 1878. Died 6 October 1886.

Selected Works

No complete catalogue of Godwin's work exists but the most comprehensive list of his architectural commissions appears in the RIBA catalogue (1973) which includes 783 working plans and drawings of 158 separate works. More than 5,000 pages of sketches, including designs for interior schemes, wallpaper, furniture, textiles, ironmongery, wall decorations, and stained and painted glass are held in the Prints and Drawings Department of the Victoria and Albert Museum, London. The museum's Department of Furniture and Interior Decoration also holds a large collection of his furniture. Other important collections of furniture are the City Art Gallery, Bristol and the Hunterian Art Gallery, University of Glasgow. The Public Records Office in London holds all Godwin's registered designs for furniture, wallpaper and textiles.

Interiors

- 1861 Northampton Town Hall, Northamptonshire (building, interiors and furniture)
- 1864 Congleton Town Hall, Lancashire (building and interiors)
- 1866-73 Dromore Castle, Co. Limerick, Eire (building, interiors and furniture): Earl of Limerick
- 1867 23 Baker St., London (interiors and furniture): E. W. Godwin
- 1870 Castle Ashby, Northampton (Chinese Bedroom)
- 1871 Fallows Green, Harpenden, Hertfordshire (building, interiors and furniture): E. W. Godwin
- 1874 Taviton Street, London (interiors and furniture): E. W. Godwin
- 1877-78 White House, Tite Street, Chelsea (building and interiors; with J. M. Whistler): J. M. Whistler
- 1878 Studio, Kensington Palace (building and interiors): Princess Louise
- 1878 33 Tite Street, Chelsea (building and interiors): Frank Miles
- 1884 16 Tite Street, Chelsea (interiors and furniture): Oscar Wilde

Godwin designed furniture for his own Art Furniture Company (1867), Collinson & Lock (c.1872-75), Gillow's (1874-76), Green & Kind (c.1861), W. A. & S. Smee (c.1883), William Watt (c.1867-86) and Waugh & Sons (1876). His best-known pieces include the *Lucretia* cabinet (1873), the *Monkey* cabinet (1876) and the *Butterfly Suite* (1877). He also designed wallpapers for Jeffrey & Co., Lightbown Aspinall & Co., and James Toleman & Sons; silk damasks for Warner & Sons and carpets for Waugh & Sons; tiles for Minton & Hollins, and Burnmantofts; and stained glass, staircases and whole interiors for William Watt (from 1877).

Publications

Art Furniture, from designs by E. W. Godwin, with Hints and Suggestions on Domestic Furniture and Decoration, with William Watt, 1877

Artistic Conservatories, with Maurice B. Adams, 1880

Numerous publications in *The Architect* and *Building News*.

Good Design Movement

The idea that there is an identifiable and common standard of "good design", agreed between experts and bestowed upon the consumer, is common to all areas of design and is most prevalent in interior design. A body of literature stipulating what was current good taste in interior design has existed since the 18th century and the emergence of the pattern book and magazine. During the mid 1790s the *Magazin für Freunde des guten Geschmacks* (Magazine for Friends of Good Taste) was published in Leipzig and carried the Neo-Classical style throughout Europe in the form of coloured plates. The banker

Thomas Hope attempted to reform British taste with his book, *Household Furniture and Interior Decoration Executed from Designs by Thomas Hope*, published in 1807. Hope illustrated the interior of his own London home and other classical examples with descriptions and stark line-drawings. However, it was not until the second half of the 19th century and the onset of mass production and the proliferation of the middle-classes that taste became an issue of grave concern for aesthetic reformers. An important collection of critical writing, published from the mid 19th century onwards, dealt with the thorny question of taste. Writers and design theorists appointed themselves as guardians of the aesthetic well-being of the nation.

The best-known exponent of this new phenomenon was John Ruskin, the leading architectural and art critic of Victorian Britain. His *Seven Lamps of Architecture*, published in 1849, spelt out his views. In the chapter "Lamp of Truth" Ruskin decreed that materials should be used honestly; the decorative paint finishes, so popular in the 19th century, were pilloried. Ruskin argued that art and architecture should imitate nature, or at least adapt forms common in the natural world. Like several influential designers of the period, including A.W.N. Pugin, Ruskin also looked back to the Middle Ages and vaunted the style of 14th-century England as the only true style.

Ruskin's work influenced Charles L. Eastlake, whose best-seller, *Hints on Household Taste, in Furniture, Upholstery and Other Details* was first published in 1868. This was one of the first books to be aimed primarily at the amateur decorator. The material had first appeared in print as articles in the *Cornhill Magazine* and the *Queen*. Eastlake's book was very popular, running to seven editions in America where an "Eastlake Style" emerged. In *Hints on Household Taste* Eastlake, in common with taste-makers before and after him, defined good design in terms of what was bad. Eastlake laid a great deal of blame for the popularity of vulgar taste at the door of the decorator, always an unpopular figure among design reformers. Eastlake objected to the influence of fashion over home decoration and the Victorian love of complex decoration and polychromy. *Hints* was followed by numerous other books and manuals on taste and by the last decades of the century the literature on interior decoration and design had become extremely extensive. The furniture makers Rhoda and Agnes Garrett, for example, published an advice manual for the home entitled *Suggestions for House Decoration in Painting, Woodwork and Furniture* in 1876. In it they proposed that one must look back to the past for the best architecture and design. The Garrett sisters' propensity was, however, not for the medieval but for Queen Anne. Across the Atlantic, Frank Alvah Parsons, founder of the New York design school, typifies American writing on the subject of good taste and the interior. He equates good design with European, classical styles of the past. For Parsons, the home should be more a testimony to one's good taste than a place to relax, a view shared by the American decorators Edith Wharton in *The Decoration of Houses* of 1897 and Elsie de Wolfe in *The House in Good Taste* of 1913.

During the early 20th century the Georgian period began to supplant the Gothic and Queen Anne as the most desirable to imitate. Decorator Edward J. Duveen's *Colour in the Home,*

With Notes on Architecture, Sculpture, Painting and upon Decoration and Good Taste was published in 1911 with 32 colour illustrations of ideal interiors. Duveen concurred with Eastlake in dismissing fashion: "A delight in new impressions, a love of change are characteristic of the simple and uneducated". In keeping with all the writers covered, Duveen was concerned with the aesthetics of interior decoration on moral grounds. From Ruskin onwards, design writers have emphasised that the adoption of "good taste" reveals the existence of an advanced civilization and healthy nation.

The shared vision of good taste in interior decoration which informed much official activity during the 20th century was the Modern Movement. For example, the British government officially adopted Modernism during World War II with the Utility scheme. Britain's involvement in the war had severely depleted materials and led to a shortage of labour for the manufacture of consumer goods. The Board of Trade could not completely halt furniture production as replacements were needed for families who had been bombed out. Therefore, furniture was allocated on a points system according to need. Prices were fixed by the Government, as was style and materials. The Government's view of what constituted well-designed furniture was informed by the pre-war activities of the Council for Art and Industry. Their 1937 report on "The Working Class Home: Its Furnishings and Equipment" had condemned surface ornament and period revivals. Good design was defined as: "... items in which the design was simple, of good proportions and without dust-collecting features". This definition was shared by the official committee which introduced the Utility scheme in 1942. The designer Gordon Russell chaired the Design Panel and welcomed the opportunity to influence mass taste. Consumers had little choice but to buy Utility, and, when restrictions were lifted in 1948, the popular Tudor revival styles were again manufactured. However, supporters of Modernism built on the experience of the Utility experiment officially to encourage good taste with the establishment in 1944 of the Council of Industrial Design (CoID).

The first public manifestation of the CoID was an exhibition held at the Victoria and Albert Museum in 1946 entitled "Britain Can Make It". This consisted partly of room settings for ideal families, ranging in social class from coal miner up to television broadcaster. Many visitors to the exhibition found the furniture dull and too reminiscent of wartime Utility. At the Festival of Britain in 1951 the CoID again attempted to influence public taste with the creation of the Contemporary Style, a watered-down Modernism which drew on the Arts and Crafts movement as well as current Swedish design. At the South Bank site, which formed the focal point of the exhibition in London, the CoID vetted all furniture and displayed a Design Index, through which visitors could browse to learn what the recommended good designs on offer were. The CoID moved to a new headquarters in Haymarket, London in 1956 and continue to promote good design to manufacturer and consumer alike through the magazine *Design*, exhibitions and televised awards.

In America similar efforts were made by museums to promote good design. For example, the Walker Art Center, Minneapolis established an "Everyday Art Gallery" in 1944 to show well-designed consumer goods to the public, and interior designer Alexander Girard organised an influential exhibition

of home furniture and furnishings entitled "For Modern Living" in 1948 at the Detroit Institute of Arts. However, with the impact of Pop during the 1960s and the subsequent decline of Modernism, the notion that one, idealised standard of taste should prevail became discredited. A new plurality of style and the dominance of the consumer has led to the decline of a singular notion of good design.

Gothic Revival

Gothic Revival architecture is noted for its dramatic shapes and silhouettes, its irregular massing, and its use of vertical elements such as pinnacles and towers. This irregularity of shape and outline lent itself readily to picturesque effects in landscape gardens and on the exterior of country houses. However, such architectural qualities cannot be translated directly into the design of interiors, where the box-like space of a room acts to contain overly plastic forms. Therefore, the Gothic Revival interior, from its beginnings in the 18th century, relied upon architectural ornament and polychromy to create a medieval effect.

By the middle of the century, the use of the Gothic style had become established in domestic architecture in Britain through the efforts of a small group of dedicated gentleman-amateur architects. It was in this context that the Gothic Revival interior began to be developed. The first important group of Gothic Revival interiors were those created by Horace Walpole at his country house, Strawberry Hill, in Twickenham, Middlesex, the first complete house in the style. The groundbreaking interiors of the house are described in Walpole's *Description of Strawberry Hill*, published in 1774 and enlarged in 1784, and recorded in a series of watercolours he commissioned from John Carter in 1788, the first systematic record of house interiors known. Walpole began to remodel the modest Thameside villa in 1750. By 1753, work on the early interiors of the Great Parlour, Library and Stairwell was underway.

The designs of the early interiors at Strawberry Hill were based upon varied sources. Some features, such as ogee-arched windows and pendant friezes, were derived directly from Batty Langley's *Antient Architecture Restored and Improved* of 1741-42, re-issued in 1747 as *Gothick Architecture*. After

Gothic Revival: Cabinet, Strawberry Hill, Twickenham, 1784

further experience of the Gothic style, however, Walpole came to refer to Langley's "bastard Gothic", because the forms he illustrated were not derived from real medieval buildings. Other designs, as in the lace-like traceried chimneypiece of the Great Parlour, were the product of the imagination of Richard Bentley, a member of Walpole's "Committee of Taste" who assisted him.

The library, designed in 1753-54 by Walpole's close friend John Chute, established the direction Walpole was to pursue – namely, towards a more literal use of Gothic motifs derived from the antiquarian books on medieval architecture that he owned. For example, the bookcases of the Library were designed using a 17th-century print by Wenceslas Hollar of the choir screen of Old St. Paul's Cathedral in London as a source. Increasingly, the Strawberry Hill interiors were designed around the collections of antiquarian objects they contained. This was the case with the Holbein Chamber (designed 1758), the guest bedroom at Strawberry Hill, named in honour of the copies of miniatures attributed to Holbein that hung on its walls. The room was furnished with other objects dating to the reign of the Tudors, and the associations provoked by the objects within Walpole's interiors played an increasingly important role in the design of his house. In this, Walpole was anticipating developments in interior design within the Romantic Movement of the 19th century.

The prophetic role of Walpole as regards the Gothic Revival is indicated by his late interiors at Strawberry Hill. The Gallery, designed in 1760 with the assistance of Thomas Pitt,

Gothic Revival: Great Drawing Room, Eaton Hall, Cheshire, by Alfred Waterhouse, 1887

has a high ceiling decorated with gilded papier-mâché “vaults” copied from those of Henry VII’s chapel at Westminster Abbey. The dramatic, enlarged scale of this interior, and its literal derivation from a late medieval source, were echoed in the interiors created by Sir Roger Newdigate at his seat, Arbury Hall in Warwickshire, from c.1755 to 1788. Newdigate, who had attended Westminster School, relied almost exclusively on the elaborate Late Gothic vaulting of Henry VII’s Chapel at Westminster Abbey as a source for a series of remarkable plasterwork ceilings executed in the 1760s. The lavishly detailed interiors at Arbury went beyond those at Strawberry Hill in their fidelity to medieval models. Newdigate was assisted by Henry Keene, Surveyor to the Fabric of Westminster Abbey, who worked with plaster casts to ensure that the detail of the Arbury interiors was “correct” Gothic.

The novelty of the style, and the fame of Walpole’s Strawberry Hill, inspired the use of the Gothic from Ireland to Russia, although the Gothic Revival was to remain primarily a phenomenon of the English-speaking world. Castle Ward in Northern Ireland (c.1760–64), the Gothic House in Wörlitz, Saxony (1770s), and the Church at Chesme Palace for

Catherine the Great (c.1780), all demonstrate the rising popularity of the Gothic style. For example, the Gothic House at Wörlitz was begun in 1773 for the von Anhalt-Desslau family at a time when German Neo-Classicism was in full progress. It provided a picturesque view in a landscape garden. Late Gothic sources in Germany and Italy were used for the designs, but the exterior Stair Tower bears a strong resemblance to the architecture of Strawberry Hill, as does the design of the Ante-Chapel interior, painted with tracery and saints in niches in grisaille work resembling the famous Stair Hall of Walpole’s house. Strawberry Hill also exerted an influence on the interiors of Petershof, a Gothic-style country house designed for the Russian tsar Nicholas I by a Scottish architect, Adam Menelaus, in 1825.

It was Walpole who promoted the work of the professional architect James Wyatt by recommending him to a friend and fellow antiquary, Thomas Barrett, as the architect to remodel Barrett’s country house in Kent, Lee Priory, c.1785–90. The house was demolished, but part of the Library has been installed in the Victoria and Albert Museum in London. This room demonstrates that Wyatt, too, looked to the Chapel of

Henry VII at Westminster Abbey as a source, although his borrowing was neither as literal nor as detailed as that of Walpole and Newdigate. Of Lee Priory, Walpole made the observation that it was, "a child of strawberry, prettier than the parent."

Wyatt was the leading architect of the day with an enormous professional practice and several important government appointments, including that of Surveyor to Westminster Abbey, succeeding Henry Keene. Through his extensive (and controversial) restoration work on Gothic cathedrals such as Salisbury, Wyatt gained a greater structural understanding of Gothic architecture than that of Walpole, which he translated into interiors at Windsor Castle for George III (1800–04) and at a number of country houses in England and Ireland. Among these, it is the legendary interiors of Fonthill Abbey in Wiltshire, created to suit the tastes of the eccentric and exceedingly wealthy connoisseur, William Beckford, that exerted the greatest influence upon contemporaries.

Fonthill Abbey was originally intended to be a sumptuous "folly" within the vast park of the Beckford estate, inspired by the younger Beckford's adolescent fantasies about the Middle Ages and fueled by the fact that a medieval friary had once stood on the site. By 1798 Wyatt was exhibiting designs for this, the largest house of the Gothic Revival, which collapsed in a thunderstorm in 1825, three years after Beckford had sold it. Fortunately the interiors were recorded in several publications, most notably John Britton's *Graphical and Literary Illustrations of Fonthill Abbey* and John Rutter's *Delineations of Fonthill*, both in 1823. At Fonthill, Wyatt perfected his architecture of effects, and nowhere was this more evident than in the design of the interiors.

Fonthill was entered by means of a 30-foot door which opened onto an enormous hall with a hammerbeam ceiling and with lancet windows and stone details in the Early English Gothic borrowed from Salisbury Cathedral, not far away. The effect of light on the stained-glass windows of the entrance hall was described as "sublime" by Rutter. At the top of the stone staircase was the octagonal hall, one hundred feet high, at the centre of two exceedingly long and richly decorated galleries which housed the bulk of Beckford's famous collection of manuscripts, furniture, and art objects. The walls of the two galleries were deep crimson, while purple and gold draperies and upholstery increased the effect of sumptuousness. The rich colouring and vast scale of the Fonthill interiors were to be highly influential on the next generation of Gothic Revivalists. These were led by Wyatt's pupil William Porden, the architect of the enormous Gothic pile Eaton Hall, in Cheshire, begun c.1804, and Wyatt's nephew, Sir Jeffry Wyatville, who was knighted for his work at Windsor Castle in 1828.

The reign of George IV saw many interesting developments in the Gothic Revival. The sale of Fonthill Abbey and the remodeling of Windsor to become the most lavish royal residence in Europe helped to increase the popularity of the Gothic style. So did the publication of a number of books on the subject, including the first accurate account of the development of Gothic architecture in the Middle Ages, Thomas Rickman's *An Attempt to Discriminate the Styles of English Architecture*, which went through seven editions from 1817 to 1881. John Britton published many topographical volumes on Gothic monuments, while a French-born architectural draughtsman

Gothic Revival: wallpaper by A.W.N. Pugin

named Auguste-Charles Pugin published elegantly drawn illustrations of Gothic architectural detail. His best known work was *Specimens of Gothic Architecture* of 1821–23. At last, accurate illustrations of real medieval architecture were available to a wider public, who began to adopt the style for more modest houses by simplifying Gothic ornamental details.

Rickman, Britton and A.C. Pugin's publications quickly reached the New World, where the Gothic had taken root by the turn of the 19th century. The first Gothic "villa" in North America is credited to A.J. Davis, a prominent New York City architect, in 1832, but Davis's most famous Gothic building was Lyndhurst, in Tarrytown, New York, a country house built in 1838–42 and enlarged in 1864–67. Details of the house were taken directly from Rickman and A.C. Pugin, while Davis's furniture began to show the influence of the younger Pugin who was probably the most important designer and architect within the entire Gothic Revival.

A.W.N. Pugin began his career by designing Gothic furniture and fittings for George IV at Windsor in 1827 at the age of 15. Pugin's furniture for the State Dining Room included sideboards and an elegant suite of low-backed, upholstered rosewood chairs with Gothic details in gilt, made by Morel and Seddon. Although he later disliked the Gothic designs of the 1820s, the two men worked at the forefront of Gothic design of this period and their designs were popularised in Ackermann's *Repository of Arts*, the leading design journal of the day. During the 1830s the younger Pugin developed his ideas on design, culminating in his most important publication, *The True Principles of Pointed or Christian Architecture*, of

1841. This impassioned manifesto, linking design and the state of 19th-century society, had a powerful influence upon all subsequent Gothic Revivalists.

The immediate impact of Pugin upon interiors, however, was not so much theoretical as decorative. Instead of the reliance upon ecclesiastical architecture shown by Walpole and subsequent Gothic Revivalists (which Pugin felt to be inappropriate to domestic interiors), and instead of the vast scale and sublime effects used by the followers of James Wyatt, Pugin's Gothic interiors were distinctly domestic in character, with scaled-down ornamental details and a rich scheme of colouring derived from his study of medieval manuscripts and decorative art, Netherlandish paintings of the 15th century, and actual medieval buildings. Even in the relatively large interiors of the New Palace of Westminster, his most important commission, the scale and character of the rich Gothic interiors he designed were suggestive of the residence of a medieval king – the function of the palace until the reign of Henry VIII.

During the 1840s and early 1850s, Pugin worked closely with a team of craftsmen and manufacturers, including John Hardman for metalwork, Herbert Minton for ceramics, and the builder George Myers, and he actually formed a partnership in 1844 with a leading London decorator, John Gregory Crace, for the furnishing and decoration of houses in the Gothic style. A small but significant group of houses were redecorated by the Pugin-Crace partnership, including several (Abney Hall, Cheshire; Leighton Hall, Welshpool; and Lismore Castle, Ireland) that were finished by Crace after Pugin's premature death in 1852. The Crace firm continued to produce designs by Pugin, particularly for textiles and wallpapers, until its closure in 1899.

By means of this "team" surrounding Pugin, his direct influence on interiors extended well into the 1860s, when a new generation of Revivalists formulated a type of Gothic known as "Reformed" under the influence of the Gothic Revival architect G.E. Street. Foremost among them was Richard Norman Shaw. Shaw had been Street's principal assistant from 1859 to 1862, and when he set up his own practice he began to develop a style of design deriving from Pugin's *True Principles* – namely, with an emphasis on revealed construction, truth to materials, and a reduced vocabulary of ornament. The essentials of this style of Gothic, which quickly spread to the New World in the designs of firms such as Kimbel and Cabus, were used principally for furnishings and interiors rather than for architecture, and it favoured the effects of simple geometric cutting and carving in wood (chiefly oak) in panelling and furniture, giving an abstract, somewhat primitive effect. Instead of the richly patterned wallpaper designs of Pugin, often derived from textiles of the Italian Renaissance, Reformed Gothic interiors featured walls hung with woven woollen textiles with simplified naturalistic motifs in deep colours. Bruce Talbert, a Scottish designer, made the Reformed Gothic style popular by means of his publications, especially in *Gothic Forms Applied to Furniture, Metal Work and Decoration for Domestic Purposes* (1868). It is possible to view Reformed Gothic as a precursor to the Arts and Crafts Movement in the sense that it relied upon vernacular sources and was a style suited to the middle classes, whereas the work of Pugin and Crace was essentially for aristocratic patrons.

In the London Exhibition of 1862, two newcomers, William

Morris and William Burges, had displayed Gothic furnishings of a distinctly bold and primitive character that was far removed from the sophistication of Pugin's work, and that was distinct in its lavish schemes of decorative and narrative painting from the Reformed Gothic designers. Morris, whose furnishing firm was to become world-famous, displayed a distinct Medievalism in his early designs of the 1860s but quickly moved on to more naturalistically inspired forms of ornament. Burges, however, forged an original Gothic style that was more in tune with Continental European developments. In this, he was greatly influenced by Eugène Viollet-le-Duc, the most important French Gothic Revivalist.

Born in 1814, two years after the younger Pugin, Viollet-le-Duc grew up in Paris at the height of the Romantic Movement. He was involved in the Revolution of 1830, the year before Victor Hugo published *The Hunchback of Notre Dame*, a novel set in Paris of the 15th century which did so much to popularize the study of Gothic architecture in France. Initially Viollet experimented with an unarchaeological form of Gothic known in France as the Style Troubadour which to a great extent paralleled the romantic and picturesque developments in England of the same period. Later he evolved a highly original interpretation of the Gothic style.

In common with James Wyatt, Viollet-le-Duc had acquired a knowledge of Gothic architecture by working on the restoration of the great French churches and cathedrals of the Middle Ages. This was during the 1840s and 1850s. In 1858 Viollet began to publish a series of works on Gothic architecture and decorative art which were widely read and used. His most important Gothic interiors – which were mixed with other styles, including the Byzantine and Early Christian – were created at the Château de Pierrefonds in Picardy, restored and remodelled for Napoleon III from 1858 until the latter's overthrow in 1870.

The powerful colour combinations, extensive use of polychromy, and original mixing of ancient styles of decoration seen at Pierrefonds inspired Ludwig II of Bavaria to build Neuschwanstein, and William Burges was inspired by Pierrefonds to remodel Cardiff Castle for the Marquess of Bute. Both these late Gothic Revival castles were begun in 1869; both featured an almost overpowering use of polychromatic decoration; and in both can be seen the mixing of ancient styles promoted by Viollet-le-Duc. At Neuschwanstein, the Early Christian and Romanesque motifs were used in combination with the "troubadour Gothic" created by Ludwig's team of designers, while at Cardiff Burges created brilliantly original interiors with strong Islamic overtones.

Despite the brilliance of Burges's Gothic designs, he found few patrons. His interior schemes were expensive to execute and were increasingly out of sympathy with the tenor of his times. Reviews of the Great Exhibition (1851) had hinted that the majority of the public, while appreciating the exciting work of Pugin and his team, found his personal brand of "True" Gothic somewhat too ecclesiastical for mainstream, domestic use. By the early 1870s the Gothic style was becoming less and less fashionable for interiors, and in a review of the London Exhibition of 1871, the lack of Gothic exhibits was noted. (This was just two years after Cardiff Castle was begun.) In 1881 the magazine *The Builder* reported that Gothic furniture was going out of favour, while in October of 1886 *The Cabinet*

Maker made the observation that, “the Gothic furniture which Welby Pugin endeavoured to foist upon the public now sells for a song.” Gothic Revival architecture still lingered, especially within ecclesiastical or collegiate contexts, but the style was all but extinct in fashionable domestic interiors by the mid-1880s.

Goût Grec

The term *goût grec* has come to describe those objects created during the first phase of the Neo-Classical movement in

France, specifically between c.1755 and 1765, and hence preceding “le style Louis XVI.” The term is a contemporary one, cropping up in diaries and art criticism of the period, but its meaning varied and it was not often used in contexts that were literally correct. The objects defined by the term *goût grec* are characterized by somewhat heavy proportions, straight lines, and the use of classical ornament such as festoons, urns, scrolls, and Greek meander patterns. They demonstrate a strident enthusiasm for the ancient world, its precepts and artistic accomplishments, and betray the anti-Rococo sentiment which was developing at this time.

By the 1740s rumblings about the excesses and license of the Rococo style were being heard, and a movement began among several factions of the art world calling for greater stability, balance, and an adherence to common standards. There was also a measure of nostalgia contributing to this reaction, a longing for the glories of the period of Louis XIV, when France’s artistic supremacy was one of the country’s greatest achievements. The monarchy had reached the height of its popularity about 1748 with the end of the War of Austrian Succession, but proceeded then to enter a period when long-standing resentments between king and parliament, state and church, and Paris and the provinces surfaced. There was measurable unrest both politically and socially.

The most significant developments and disaffection occurred in the intellectual field, where figures such as Voltaire, Montesquieu, and Diderot produced works which systematically attacked certain foundations of French society – the monarchy, the Catholic church, and the judicial system. The Enlightenment called for the triumph of human reason and a rejection of the frivolity and privilege associated with the Rococo style. There was nothing logical about French art and interiors of the earlier part of the century, and this was unacceptable to the current generation of intellectuals.

The *éminence grise* of Neo-Classicism was the Comte de Caylus (1692–1765), an antiquarian who published his important collections of antiquities and waged an anti-Rococo campaign through lectures given at the Académie de Peinture et de Sculpture and the Académie des Inscriptions. His effect on architecture has been disparaged, but there is no contesting the significant influence his published collection had on the decorative arts. Designers of furniture and other household objects found a treasure of ornament and motifs here, a new vocabulary for their work. Others in Caylus’s circle were the Abbé Leblanc, credited with being the first to publish a direct attack on Rococo style, in 1745; the collector Pierre-Jean Mariette, who wrote a stinging obituary of Meisssonier; and Abbé Barthélemy, curator of the Cabinet de Médailles.

Besides these promoters of “l’Antiquité” there were the “philosophes,” those who openly and nostalgically praised French tradition and the “good taste” of the previous century. Prominent among this group was Jacques-François Blondel (1705–74), an architect, architectural theorist, and lecturer at the Académie. Blondel also established his own architecture school, the first outside of the Académie, where he exercised considerable influence, and contributed to Diderot’s *Encyclopédie*. He believed in the separation of architecture and sculpture on buildings, and espoused functionality, symmetry, solidity, and avoidance of superfluous ornament.

In the meantime, France had been continuing to send

promising native sons to Italy to study its arts and architecture. A circle of young artists at the Académie de France in Rome began in the 1740s to develop a strong, new vision of architecture which relied not only on antiquity, but also on Baroque design, for its inspiration. Jean-Laurent Legeay was among the most talented of this group, and he produced highly dramatic works where humans are dwarfed by monumental ruins and the presence of the past is almost overwhelming. These young artists in due course returned to France, and Legeay's appointment as professor at the Académie in Paris, in 1742, ushered in a welcome freshness and revived academic interest in classicism. The first hints of Neo-Classicism were beginning to be manifested in the work of this new generation.

Another to make the pilgrimage to Rome, although in a different capacity, was the Marquis de Marigny, the brother of Madame de Pompadour. The latter had urged her brother to make the trip as preparation for his impending appointment as Directeur des Bâtiments, and he spent nearly two years there, from 1749 to 1751, in the company of Abbé Leblanc, the architect Jacques-Germain Soufflot (1713–80), and the designer and engraver Charles-Nicolas Cochin (1715–90). Marigny was at least a partial convert to *l'Antiquité* – the extent of his admiration is the subject of differing opinions – but he flatly rejected the Baroque, and official taste was thus directed. Considerable debate has centered on the issue of whether the Marquis's voyage marked the beginning of the anti-Rococo movement, but it should be emphasized that the evolution of Neo-Classicism was a process which developed on several fronts, as outlined above.

It is important to mention the excavations at Pompeii and Herculaneum (1754), the temples of Greece (1758), and Paestum (1764), for a steady stream of information about these remains was published over the course of several decades in Europe, exciting general interest. These rediscoveries of the art and architecture of ancient Greece and Rome provided another important source for contemporary artists and architects, as well as designers of everything from clothing and jewellery to stage sets. Also, one must note the growing predilection for architecture and objects in the English style during this time: "Anglomanie" was exceedingly influential in matters of French taste. The English had maintained keen interest in Classical design throughout the earlier part of the century and it cannot be assumed that this went unnoticed or unappreciated by the French.

The first artistic field to exhibit changes in the direction of Neo-Classicism was architecture. French Rococo architects and designers had not rejected all the features of classical design, thereby providing a window for hybrid interiors of the mid-century which appear to bridge Baroque with early Neo-Classicism. The full acceptance of such schemes is demonstrated by Blondel's praise of Pierre Contant d'Ivry's interiors in the Palais-Royal, dating to 1755–57. These rooms blend Classical architectural features in a Baroque vein with tempered Rococo ornament and furnishings: there are strongly articulated columns and pilasters and Roman arches of stately proportions, all embellished with floral garlands, putti, and frilly shells.

Soon following this development was a proliferation of accessories and *objets d'art* in the "Greek taste." The publication of numerous books of classical ornament, both directly

copied from Greek and Roman prototypes and imaginative interpretations, had provided designs for easy copying by goldsmiths and mount-makers. Ornament preceded form and structure, which led eventually to adoption by sculptors and painters of the new aesthetic. In fact, it is this vogue for superficial and unbounded "Greek" decoration that led to harsh criticism of the early Neo-Classical manifestations. Some contemporaries bemoaned the silly fashion for everything "à la grecque" and condemned all but the most serious interpretations of antiquity.

There is one early interior with its furnishings which is commonly cited as a prime example of *goût grec*. It is the study designed c.1756 by Barreau de Chefdeville, Caffiéri, Leroy, and Le Lorrain for the Parisian collector Ange-Laurent de Lalive de Jully. The ebony and gilt-bronze furniture, which has survived to this day (Musée de Chantilly), is massive and rectilinear, and sports ornament inspired by Greek architectural motifs – deep fluting, Vitruvian scrolls, lion pelts, and *cordes à puits*, heavy rope-like garlands. While the ornament is in a pure classical idiom, the structure of the pieces owes a debt to Baroque design in its resemblance to pieces by A.-C. Boulle. Indeed, a hallmark of much early Neo-Classical furniture design is its resemblance to the monumental works created under Louis XIV. The study itself has not survived, but descriptions tell of a new sort of decorative scheme, novel in the components as well as the manner in which they were all put together.

Lalive de Jully and Cochin believed this room to have prompted the mania for the *goût grec*, and despaired that so much abuse of the serious study of antiquity should have resulted from this example. But they also recognized the influence information about Pompeii and other excavation sites had on this fashion. An oft-quoted passage from Baron de Grimm's *Correspondance littéraire* (1763) suggests the degree to which this fad spread: "Depuis quelques années, on a recherché les ornements et les formes antiques; le goût y a gagné considérablement et la mode en est devenue si générale que tout se fait aujourd'hui à la grecque" (In the years since the discovery of antique ornament and antique forms, the taste for such things has grown considerably and the fashion has become so general that today everything is in the "Greek" mode).

While the actual meaning of the term *goût grec* in contemporary usage varied, it is generally acknowledged today that the description "Greek" was often loosely attached to anything inspired by antiquity. *Goût grec* and *style antique* were synonymous, partially because of the historic veneration of the Greeks and the assumption that ancient Roman architecture was merely derived from that of Greece. It has been contended, too, that the expression *goût grec* really just meant that something was in a non-Rococo style. The logic of this may be clearer when one understands that the Rococo and the new Neo-Classical style existed side-by-side for several decades, and the "Transitional" period leading to Louis XVI was largely characterized by the application of Neo-Classical ornament to basic Rococo forms. It would not be until the late 1760s that the sober, elegant, and lighter Louis XVI style epitomized by architects such as François-Joseph Bélanger and Jean Démosthène Dugourc and that represented the next phase of Neo-Classicism, would fully emerge.

Graves, Michael 1934-

American architect and designer

Michael Graves was born in Indianapolis and trained as an architect at the University of Cincinnati and at the Graduate School of Design at Harvard University where he graduated in 1959. He worked briefly in the office of George Nelson in New York before winning a Prix de Rome fellowship which made it possible for him to work at the American Academy in Rome from 1960 until 1962. On his return to the United States he accepted a teaching position in the architectural school at Princeton University and, in 1964, established his own architectural practice in Princeton.

He became known in the 1970s for his work in a loose affiliation with the architects called "The New York Five" or, as they were informally known, "The Whites" in recognition of the highly abstract, white painted geometric forms of their architectural design. This was a style of late Modern work suggesting a devotion to the puristic principles of the International Style Modernism of the late 1920s and early 1930s. Graves's work soon separated itself from that of the Fives with an increasing introduction of decorative elements, historic references and a use of varied color, generally in a range of hues and pastel tints unlike the reserved color uses of Modernism.

As the term Postmodernism came into use, Graves came to be viewed as a key figure in this development although he would not regard the term as fully appropriate to his work, preferring the word "figurative" for his architecture. Among the projects that first brought him to prominence were several

houses and their interiors and a number of interior projects including a clinic in Fort Wayne, Indiana (1971) where strong color and original mural painting gave the spaces a highly individualistic character. In 1981 and 1982, he contributed furniture designs to the Milan-based Memphis venture including the *Plaza* dressing table and the *Stanhope* bed, designs with a strong connection to Art Deco precedent.

From 1980 to 1986, Graves was active as a designer for the Sunar Hauserman furniture firm designing offices and showrooms in a number of cities including New York, Chicago, Houston, Dallas and London. These showroom interiors were colorful and full of unusual and imaginative forms that ranged from decorative to somewhat eccentric. Graves was also the designer of furniture produced by Sunar Hauserman so that these showrooms and their contents were influential in bringing Graves's work to the design professions in an influential manner.

The 1983 Portland city office building, a commission won through a national competition, was a major building project, widely published and sufficiently controversial in character to elicit the statement from one architectural critic that it had "set American architecture back by fifty years". It was the use of non-functional, strictly decorative elements and the seemingly arbitrary use of colors and bands of trim that made the building a striking example of Postmodernism, inevitably to be praised by those admiring of this direction but condemned by the entrenched adherents to the doctrines of Modernism. An increasing flow of work has come to Graves as he has come to be regarded as a key figure in current architecture and design in America. Most of his architectural projects incorporate interiors of his own design. Among the most striking are the 1982 San Juan Capistrano Library, the Clos Pegase Winery in Napa Valley (1984) with its hints of the 18th century design of Ledoux, the large Humana office building in Louisville (1985) and various projects for Walt Disney ventures including corporate headquarters in Burbank, the Walt Disney World Dolphin and Swan hotels in Orlando, Florida, and the 1989 Hotel New York at Euro Disneyland in France.

In addition to continuing work in furniture design, Graves has been active in the development of various other products for household interior use such as tableware, carpets, textiles, small clocks and the well-known 1985 tea-kettle for Alessi known as "fledgling" for the metal bird-whistle perched on its spout. Graves has established a retail shop in Princeton near his home and office where a variety of products of his design are offered for sale, and a mail-order catalog offers these products as well. The items offered include jewelry, watches, leather goods, lamps, picture frames and woven wool blanket-scarves. Graves's sketches and drawings have been widely published, admired and collected.

Recent commissions include a number of libraries, theaters, office buildings, college and university projects and exhibition design projects. The work includes projects in Taiwan, Japan, Belgium and in many American cities. Graves's designs for the expansion of the Whitney Museum of American Art in New York have been widely published and have excited much discussion as a result of the way in which the strong Postmodern character of the addition would contrast with the existing building by Marcel Breuer.

Graves has been an active teacher of architecture at a

number of universities and is the winner of many honors and awards including membership in the American Academy of Arts and Letters.

Biography

Born in Indianapolis, Indiana, 9 July 1934. Studied at the Department of Architecture, University of Cincinnati, 1954–58; graduate student, Harvard University, Cambridge, Massachusetts, 1958–59; awarded the Prix de Rome and studied at the American Academy, Rome, 1960–62. Married 1) Gail Devine (divorced): 2 children; 2) Marie Lucy James (divorced 1977). Lecturer, 1962–63, Assistant Professor, 1963–67, Associate Professor, 1967–72, and Schirmer Professor of Architecture since 1972, Princeton University. Established his own architectural office, Michael Graves, Architect, Princeton, and Principal since 1964. Also active as a painter, muralist and designer with numerous designs for furniture, textiles, lighting and tableware from the mid-1970s. “Graves Design”, product design department of Michael Graves, Architect, launched, 1991; opened retail shop for the sale of his own furnishings and products, Princeton, 1994. Has taught at many colleges in North America: Visiting Fellow, Institute for Architecture and Urban Studies, New York, 1971–72; Visiting Professor, University of Texas at Austin, 1973 and 1974, University of Houston, 1974 and 1978, New School for Social Research, New York, 1975, and University of California at Los Angeles, 1977. Numerous awards including 9 American Institute of Architects National Honor Awards from 1975, Louis H. Sullivan Award, 1994. Member, American Academy and Institute of Arts and Letters, 1991.

- 1987 15 Lenox Showrooms and Galleries, various locations including Florida and New York (buildings, interiors and furnishings)
- 1989 Hotel New York, Euro Disneyland, Marne-la-Vallée, France (building, interiors and furnishings)

Graves has been a prolific designer of furnishings and other products and many of his buildings and interiors have contained examples of his work. His furniture includes collections produced by Sunar Hauserman, 1977–87; many designs for Memphis, including *Plaza* dressing table (1981) and *Stanhope* bed (1982), during the early 1980s; the MG2 and MG3 club chairs by Saways & Moroni (1985); and the *Kyoto Collection* for Arkitektura (1989). His textiles include carpet designs for the *Dialog* collection for Vorwek (1987). He has also designed tableware, including the celebrated “fledgling” teapot (1985), for Alessi and ceramics produced by Swid Powell, including 1985 *Big Dripper* coffee pot.

Further Reading

The literature on Graves is extensive. The standard monographs covering his architectural projects which include numerous illustrations of interiors are Arnell 1982 and Nichols 1990. For a study that concentrates on Graves’s work as a designer see Abrams which also contains a select bibliography of books and articles relating specifically to this area.

Gray, Eileen 1879–1976

Irish architect and designer of interiors, furniture and textiles

Eileen Gray's reputation and status as a designer has, like her work, been through several phases. Her early lacquered furniture was highly sought after by wealthy Parisian patrons of Art Deco, while her later minimalist, black and chrome furniture, reproduced since the 1970s by Zeff Aram in London and Andrée Putman in Paris, has been an inspiration for a new generation of style-conscious designers. Today, she is often hailed as a pioneer of modern design. Yet, for Gray herself, it was her architectural work that was most significant and it is in the interiors of her two major buildings that her particular brand of humane Modernism, with its sensitive detailing and ingenious functionalism, triumphs. Her small, inventive legacy of furniture, rugs, lighting, room schemes and houses reflects both her perfectionism and her responsiveness to the evolving materials and shifting themes of the early and mid 20th century.

Born in Ireland into an aristocratic and artistic family, Gray travelled widely in Europe as a child before enrolling to study painting and drawing in London at the Slade School of Art. She became interested in furniture and oriental lacquerwork during her many visits to the South Kensington Museum (now the Victoria and Albert Museum) and joined D. Charles's Dean Street Street lacquer restoration workshop between 1900 and 1902. From 1902 to 1905 she studied in Paris at the Atelier Colarossi and the Académie Julian and settled there in 1907.

Fuelled by the interest generated by the display of Japanese antiques and crafts at the Exposition Universelle of 1900, Paris had attracted several Japanese craftsmen including the lacquerwork artist Seizo Sugawara with whom Gray subsequently trained. She began her career by producing decorative panels and screens, followed by furniture, desks, bookcases and beds, designed in a contemporary idiom, and which she exhibited at the prestigious Salon des Artistes Décorateurs from 1913. Undaunted by the technical vicissitudes of lacquer, she responded to its need for high standards and recognised its affinity with a luxurious, but at the same time austere, Modernist aesthetic. Her most celebrated piece of this period was the *Le Destin* folding screen of 1914, an exotic fusion of symbolist, figurative and abstract Deco styles, that was commissioned for the newly refurbished apartment of the Paris couturier and collector Jacques Doucet.

Gray worked in London during World War I, but returned to Paris in 1918 where she extended her sphere of interests to include interior decoration, designing a spectacular apartment in the rue de Lota for the wealthy milliner, Suzanne Talbot between 1919 and 1922. This innovative commission has been described as the epitome of Art Deco and combined luxury furniture with avant-garde work. It included geometrical light fittings made out of ostrich eggs, parchment and lacquer, draped animal skins, abstract rugs, lacquered "brick" screens, and exotic, salmon-pink chairs. The centrepiece was the gondola-shaped *Pirogue* day bed, finished in patinated bronze lacquer, which stood on twelve arched feet as if awaiting a 1920s odalisque. Throughout, African and Oriental influences converge with a sleek, Parisian opulence.

In 1922 Gray opened the Galerie Jean Désert, an exclusive showcase for her furniture, screens, lamps, mirrors and Modernist hangings in the rue du Faubourg Saint Honoré for which she also designed the minimalist façade. Although the shop was never a commercial success – it closed due to financial losses in 1930 – Gray numbered among her clients some of the most fashionable and glamorous figures of the day including Elsa Schiaparelli, the Maharajah of Indore and the Countess of Oxford. The weaving workshop which produced some of Gray's most coveted designs for rugs, hangings and carpets, was run by her companion and partner, Evelyn Wyld.

The geometric, almost painterly style of Gray's textiles was clearly indebted to Cubist and De Stijl influences and by the mid 1920s her work was becoming increasingly Modernist in appearance. Her furniture began to exploit more utilitarian forms, and, eschewing earlier Art Deco effects such as tortoiseshell, silver leaf, tasselled lacquer, mother of pearl inlay and ivory carving, she turned to industrial materials like tubular steel, sheet aluminium and glass. Not surprisingly, the austerity of her new style was not universally admired by her existing clients, and the bedroom / boudoir for a house in Monte Carlo, exhibited at the 1923 Salon des Artistes Décorateurs, provoked some hostile criticism. But it attracted much more favourable comment within avant-garde circles and the Dutch De Stijl magazine, *Wendingen*, published an issue in 1924 that was entirely devoted to a laudatory exposition of her work.

Encouraged by the Romanian architect Jean Badovici, Gray embarked upon a number of architectural projects whose severely functional appearance seems to have evolved out of the abstract and constructivist principals of her furniture. From 1926 to 1929 she designed and built E-1027, a villa overlooking the sea at Roquebrune in a remote part of the South of France. Admired by Le Corbusier, this building is unequivocally Modernist in form, but it is the interior that defines Gray's principal contribution to the Modern Movement. The rooms were clean, sparse and comfortable, the space was multifunctional, and the furnishings include some of her most inventive and flexible items, such as the *Transat* and *Bibendum* chairs, swivelling mirrors, adjustable tables, deckchairs that also act as indoor chairs, and alternate day and night lights. Devoid of pattern, the decoration is restricted to areas of monochrome with a deep blue in the rugs, and luxurious touches such as padded white leather upholstery, and lacquer and glass, co-exist with industrial materials like perforated steel, celluloid, felt and cork. Gray's aim was to create a harmony between architecture, interior space, and fittings in a humane Modernist idiom.

Her interiors for Badovici's studio apartment in Paris were an exercise in designing for compact living. Using devices such as concealed storage areas in the ceiling, and mirrors to create an illusion of space, she organised a complete home containing kitchenette, bar, bathroom, bedroom and office within a space of no more than 40 square metres.

Gray's only other completed architectural commission was a house called Tempe à Pailla at Castella in the South of France. This house reveals her growing preoccupation with the idea of a fully integrated, reductionist, living space, and uses compact, built-in furniture with sliding doors and windows. Flexibility was emphasised with a wardrobe that could extend if extra space were needed and a step that doubles as a drawer.

Gray: apartment for Suzanne Talbot, Paris, 1922

The canvas-backed, S-shaped outdoor chair folded up for storage and the dining table adapted to coffee-table height. *Tempe à Pailla* was later purchased by the painter Graham Sutherland.

A founder-member of the Union des Artistes Modernes, Gray continued to explore functionalist and egalitarian ideals in the mid- and late 1930s with projects such as designs for storage units, the Tube House of prefabricated metal, and a Centre des Vacances including a restaurant / cafe, open-air theatre, housing and a recreational area for young people. Gray lived in semi-retirement after World War II and it was not until the 1970s that her work began to enjoy belated acclaim. Reproductions of her furniture, rugs and light fittings proved particularly popular in the High-Tech interiors of the late 1970s and 1980s and original pieces are highly sought-after collector's items today.

SUSAN HOYAL

Biography

Eileen Moray Gray. Born at Brownswood, Enniscorthy, County Wexford, 9 August 1879, the daughter of Baroness Gray. Educated at the Slade School of Art, London, 1898–1902; trained in lacquerwork at D. Charles furniture workshops, 92 Dean Street, Soho, 1900–02; studied drawing at the Atelier Colarossi and the Académie Julian, Paris, 1902–05; studied furniture making and lacquerwork with the Japanese craftsman Seizo Sugawara, Paris, 1907–14. Independent furniture and interior designer from 1908; textile designer and archi-

tect from 1926. Joint owner of lacquerwork and furniture studio, with Sugawara, in London, 1915–17, and Paris, 1918–22; proprietor of the furniture showrooms and interior decorating service, Galerie Jean Désert, Paris, which she ran with Evelyn Wyld, 1922–30 (Wyld resigned 1927); worked on architectural projects with Jean Badovici from 1926. Founder-member of the Union des Artistes Modernes; exhibited at Salon des Artistes Décorateurs, and Salon d'Automne, Paris, during the 1920s, and Exposition Internationale, Paris, 1937. Honorary Royal Designer for Industry, Royal Society of Arts, London, 1972; Fellow, Institute of Architects, Ireland, 1973. Died in Paris, 31 October 1976.

Selected Works

A checklist of Gray's complete works appears in Adam 1987. A collection of architectural drawings, glass negatives of houses and furniture, working papers, notebooks and correspondence (1913–37) is held in the Archive of Art and Design, Victoria and Albert Museum, London. Examples of her furniture are in the Musée des Arts Décoratifs, Paris.

Interiors

- 1919–22 Apartment, rue de Lota, Paris (interiors and furnishings): Suzanne Talbot (Mme. Mathieu-Lévy)
- 1923 Salon des Artistes Décorateurs, Paris (bedroom-boudoir for a Monte Carlo studio)
- 1925–28 Apartment, 21 rue Bonaparte, Paris (interiors and furnishings): Eileen Gray
- 1926–29 E-1027, Roquebrune, Cap Martin (building, interiors and furnishings; with Jean Badovici): Eileen Gray

- 1930–31 Studio / Apartment, 17 rue Châteaubriand, Champs Élysées, Paris: Jean Badovici
 1932–34 Tempe à Pailla, Castellar, near Menton (building, interiors and furnishings): Eileen Gray
 1937 Exposition Internationale, Paris (project for a Centre des Vacances, in Le Corbusier's Pavillon des Temps Nouveaux)

Furniture

Gray designed numerous items of furniture and lacquered screens from 1913; her many designs for textiles and lighting date from the early 1920s. Well-known furnishings include *Le Destin* (1914), *La Nuit* (1919) and the *Block* (1925) lacquered screens; the *Pirogue* day bed (1919–20); the *Bilboquet* and *Lotus* tables (both 1915); and the *Transat* chair (1925). Much aluminium furniture, including the *E-1027* table, was produced for her house of the same name.

Publications

Greece, ancient

A discussion of interiors in Ancient Greece should begin by mentioning two defining conditions. First, Classical Greece

was a world where life was lived outdoors. Second, decoration was integral to the forming of all Greek material culture – the Greeks used rich ornamentation and vivid colours in all their fabrication, whether of tools, clothes or buildings. There was no division between major and minor arts; no lines separated sculpture, architecture and decoration. Interior decoration, therefore, becomes a category of little relevance in this context.

Classical Athens had great building programmes of immense importance; these symbolised, made concrete, commemorated and enabled to be formed the great public events of social life. There were the *stadion* and the *oedion*, the places between buildings for great histories to be declaimed and the theatres for tragedies to be performed. In this way the spaces of the city were formed and inhabited; yet it was not a world of indoors. Even though the Athenians (in contrast to their peninsular rivals the Spartans) developed new building forms for everything in their young democracy, life was still conducted *en plein air*. The great Athenian law court, the *heliaia*, held 1,500 people – a minimum jury size numbered 201 citizens. Yet the court's walls were only about one metre high. Public life was visible, observed. The need to succeed, which defined the citizen, was as visible as the shame of failure. Civic rules – laws, agreements, and even the payments and contracts to build the famous temples – were chiselled in stone and set up outdoors.

With the citizenry spending its life outdoors – whether engaged in drama, politics, religion or law – solid public buildings in the city were particular objects. They were storehouses of one sort or another, and were not dedicated to human action. Seeing such places as objects of enclosure, there is a resonance with the boxes and chests which, for classical Greeks, signified the lives of women. And women were non-citizens; invisible in the civic agenda and its life.

Classical culture was defined by sets of opposites, and of these none ran deeper than that between citizen and non-citizen. All the aforementioned comments about "Athenian life", therefore, refer exclusively to the smallish minority of the male population who were citizens. Civic life and work took place outdoors. The farmer-citizen who took up arms for his *polis* (his city-state) in time of need, was their ideal model (as it would, millennia later, be that of the US Founding Fathers). Indoors was the realm of children and of women (whose principal occupation was weaving); of food, sex and sleep.

The greatest of the Classical Greek solid treasure chests, the Parthenon, epitomised this Athenian sensibility. Its outside, a columnar, rhetorically-clad skin (rather than a set of façades) was the most exposed and visible form in the city, an icon of civic unity. Its interior, dark and mysterious, clothed and shrouded the great image of their civic goddess Athena (known as *Parthenos*). The Parthenon was highly decorated with carved and gilded ceiling bosses glinting in the dim light far above the eye. Within the encircling double columns, deeply coloured patterning, fretwork ornament and an array of honeysuckle and palmette patterns, gilded bronze rails and grills could be discerned. But all this was for the goddess rather than the populace. The public ceremonies and processions, including the sacrifices at the great altars, like the attention of the human pilgrim, were all outdoors.

The temples were exquisitely formed storerooms. The Parthenon, uniquely, had two utterly different such spaces: one

literally for the civic treasure, and another for Pheidias' vast figure of Athena all covered in ivory and gold. These stuffy, enclosed, airless boxes symbolise treasure; even more they symbolise motherhood and the link with the earth. (Athens' mythical ancestor, the child king Erekhonios was, as an infant, kept in a chest on the *akropolis*.)

Public life gave form to the immortality of the *polis*; in the *agora*, where the citizens governed themselves, and on the *akropolis* where their enduring greatness was celebrated. And, in their irresistible urge to polarise, private life was modest and simple, the hidden realm of necessity and of individual mortality. The city, then, was an almost Oriental mixture of splendidly formed and gilded public buildings in the midst of mean, ill-grouped housing.

Within the city streets, private spaces were indistinguishable: whether of new (5th century BC) opulence or of aching poverty. They all lay beyond the blank thresholds, outside which – in Athens at least – the citizens were *isoî*, equals in a politics structured by democratic *isonomia*. Inside the private world, beyond the high, windowless domestic walls, lived the women and servants. "A wife's business," said Xenophon in *Oikonomikos*, "will be to stay indoors." The rude, domestic forms were simple to an extreme: quarters for the women (where the domestic belongings were stored in chests), places for the preparation of food and cooking round the court (with small cells for storage of provisions), and men's quarters off the court (often with direct private access to the street); perhaps also a yard for domestic animals. All this spread away from the civic-monumental centre as an Indian or Yemeni town of today.

The larger courtyard dwelling was a miniature city, the yard its *agora* where the household freely mingled – if there were no strangers present. (Women of the household would not be in the court if there were male visitors.) It was surrounded by a colonnade onto which opened the rooms, often really formed with walls just back and sides. It was open to the sun and sky (main rooms to the northwest of the court to catch the sun), but quite cut off from the public realm beyond. It was centred on the peristyle of slender columns with, occasionally, a delicately patterned mosaic carpet.

Whatever the curtilage of the household, and it was often not rectangular, the dwelling inevitably centred on this strictly rectangular peristyle court, always the largest unit in the house. The Athenian suburb of Olynthus, for example, laid out exactly while the Parthenon was coming to completion in the later 5th century BC, was made up of ordered streets of back-to-back courtyard houses (separated only by a narrow lane), strung between wide avenues. Sometimes (but our only firm evidence is post-classical, notably from 4th-century Delos), two-storey homes could be centred on a magnificent double-height court with a colonnaded gallery running round the upper level.

In the classical 5th century BC, columns were wooden posts, floors usually cemented or just hardened earth, and the wonderfully decorative wall ornamentation and mosaic pavements of later years were still extremely rare. There was great restraint in domestic decoration, walls being strongly coloured, often in red. The predominant colours were still those archaic earth hues: white, yellow, red and black. There would be very few movable furnishings – though wonderfully restrained and

elegant craftsmanship formed the noble beds, tripods, chests and chairs seen in their vase paintings and other representations. Fabrics of all kinds must have covered walls, enclosed colonnades, draped furniture and formed bedding.

In the next century, domestic luxury began to develop; it was not unusual for walls to be divided by highly ornamented dados, a metre from the floor, into dark bases and lighter higher areas, capped with painted friezes of egg-and-dart, meander, Greek key or other repeating elements, often now exploring a wider range of colours. Perspective painting, well-known in the classical period (though none remains), must have permeated the private realm, probably in murals of tempera on plaster, in the generations before the famous wall perspectives and *trompe-l'oeil* paintings of Rome and Pompeii.

But, whether descriptions derive from the 5th century BC or from later times when Athens had become a cultured backwater (like Cambridge to Rome's London), they always only refer to the one major interior space beyond the court: the *andron*. This room, often translated as "dining room" means, of course, the men's room. The women's quarters, the *gynaikion*, were separate; and, if the household was affluent enough, they were upstairs, even including a room called *parthenon* or room of the virgins, being the one where sexual intercourse was taboo. Married women never penetrated the *andron* and the only women permitted within this area were servants or prostitutes.

Greek public life was exterior; Greek private life, beyond the *andron*, was considered so insignificant as to be invisible and certainly beyond the realm of interior design. The basic *andron* had fixed benches round the three sides, forming space for a dozen or more to recline. Here the men ate, reclining, spitting and throwing the food debris onto the floor, where it could be washed away towards a street drain. In larger houses, on top of the cemented raised brick platforms which often made a horseshoe shape of the *andron*, there would also be couches whereon they held their *symposia*, parties where they drank, flirted, fondled prostitutes (both male and female), talked, boasted and ate.

On the whole, domestic interiors were plain. The houses had mostly plastered unbaked brick walls on stone bases, with a steep wooden stair to an upper storey with a clay floor, and covered in a tiled, pitched roof. The rammed earth ground floor sometimes had a cemented finish which could be polished and occasionally decorated with mosaic, which might pick out the fixed position of the few important elements like couch or bed. Movable furniture existed only in the wealthiest of households where its design was of exquisite elegance and proportion, and it was made in chosen woods, perhaps inlaid, and with metal fixings.

Although fabrics were surely at the essence of the Greek interior, they have proved almost impossible to reconstruct, and their meaning, both sensual and cerebral, can only be guessed in a parallel study of the draping and revealing of Greek bodies with clothing. Curtains were used in place of doors and hangings were often perfumed. All women wove, and designs were both woven and printed onto cloth. Greeks also loved tents: nationally, the tent of Xerxes, won in battle, was an important Athenian icon; more domestically, splendid canopies were erected in gardens and at the *akademia* for *symposia*.

Greek houses also had kitchens, sometimes with flues, and washrooms, sometimes with terracotta basins. But virtually no clues survive as to the disposal of bodily waste in Classical interiors. Athens was a densely packed carpet of ill-drained courtyard-houses with inadequate latrines. The terrifying plague, more deadly than the Spartans, was no respecter of class or affluence; in its epidemic of 430 BC, it took as one of its last victims Athens' greatest leader, Perikles.

JOHN MCKEAN

Greene, Charles 1868–1957, and Greene, Henry 1870–1954

American architects, interior and furniture designers

Influenced by the ideology of the Arts and Crafts Movement, the designs of Charles Sumner Greene and Henry Mather Greene established the standard for the development of the California bungalow in the early decades of the 20th century. The Greenes were skilled as both architects and craftsmen in their own right. Their early work reflected their strong debt to Asian influences as well as a preference for residential commissions, which particularly suited their emphasis on complete aesthetic control. Their rigorous standards of craftsmanship and use of rich materials, combined with a masterful sense of space and detail, resulted in some of the most significant examples of American architecture and interior design from this period.

Early in life, with their father intent on establishing their architectural vocation, the two brothers were sent to a manual training school opened by Calvin Milton Woodward, a student of William Morris. Through the teachings at this school, the Greenes quickly absorbed the elements of Morris's philosophy

and gained a particular respect for the elemental properties of various materials including wood and metals, thereby establishing the basis for their own approach to design. In 1891, after two years of study at the Massachusetts Institute of Technology, the brothers engaged in an architectural apprenticeship in Boston where they were first exposed to the arts of Asia through visits to the Boston Museum of Fine Arts. Their interest in the arts of China and Japan was further enhanced by a visit to the Japanese pavilion at the Chicago 1893 World's Columbian Exposition. As with Frank Lloyd Wright, another young architect visiting the Exposition, the simple lines and uncluttered spaces of the Japanese structures were ultimately to inspire the brothers towards a vocabulary in American architectural design that was greatly unlike the Neo-Classical ornamentalism of the Beaux-Arts school.

Soon after leaving the Exposition, the brothers travelled to Pasadena, California and found the cultural and natural environments particularly suitable for the development of their work. Their first few commissions involved an unusual combination of Shingle, Mission, and Neo-Classical styles that met with varying degrees of success. By 1901, their designs, including Charles's for interior furnishings, continued to develop in the face of other potential influences such as the work of C. F. A. Voysey, Will Bradley, Frank Lloyd Wright, and Peter Behrens, all of whom were becoming known through publications such as *International Studio Magazine* and *Ladies Home Journal*. Of particular importance to the changes in the Greenes' work was Gustav Stickley's *The Craftsman*, which heralded the most significant period of American Arts and Crafts philosophy. A few months after the first issue of *The Craftsman* appeared, the Greenes selected a number of pieces of Stickley furniture for the interior of the James A. Culbertson house (1902) in Pasadena, and began to experiment with built-in seating, contrasting bands of dark wood and tan-colored wall surfaces, and simple linear patterns for leaded windows. By 1903, with the construction of a house for his sisters-in-law, Martha, Violet, and Jane White, Charles began producing his own furniture designs for clients. Reflecting the growth of the American Arts and Crafts movement, during the next few years the Greenes increasingly developed the possibilities of a completely integrated structure which included their involvement in such details as the design or selection of furnishings, fabrics, pottery, and metalwork.

The Jennie A. Reeve (1904) and the Adelaide M. Tichenor residences (1904) in Long Beach, California both exemplify this development in the refinement of their interior design work. The Reeve interior still strongly reflects the vision of Stickley in Charles's rectilinear designs for the furniture, but other details, such as the delicately executed stylized patterns of the leaded glass and the forms of the copper light fixtures, betray the Greenes' attraction to Japanese-style elements. Through an understanding client and a free rein to control all aspects of the commission, the Tichenor residence became their first fully integrated bungalow which included a more mature expression of their creativity and interest in oriental motifs. The furniture for the house shows a departure from Stickley's severe lines with gently rounded Asian cloud-like forms which softened the designs and became a signature of their work in the period before 1909. The once angular forms became highly sculptural expressions of cabinetwork, revealing a sophistica-

tion and originality that were the Greenses' own. In addition, Charles's experimentation with varying widths of lead overlays for stained-glass panels provided new opportunities for the depiction of branches, vines, and other naturalistic motifs in a manner unlike, yet complementary to, the often geometric patterns preferred by Henry.

By 1905, as the Greenses continued to gain commissions and had established offices in both Los Angeles and Pasadena, the brothers turned to the firm of Peter and John Hall to execute their designs for furniture, and the firm of Harry Sturdy and Emile Lange for their complex stained-glass work. Aided by these talented craftsmen who could meet their high standard of workmanship, the Greenses quickly completed a number of commissions which won them recognition not only in Pasadena, but throughout the United States. During the next few years, the refinement of their work continued in such commissions as the additions and alterations to the Van Rossem House (1906), the Theodore Irwin House (1906), and the furnishings for Dr. William T. Bolton (1906). The Bolton furniture marked the first occurrence of their trademark square ebony "pegs" in joinery and marked a move away from the use of ash and oak to the richer teaks and Honduras mahoganies that characterized the interiors of their elaborate bungalows of the following three years.

Between 1907 and 1909, wealthy Easterners who were drawn to the pleasant climate of southern California offered the Greenses substantial commissions which resulted in some of the most elaborate and significant expressions of their mature style. The unlimited budgets of these few "ultimate bungalows" allowed the Greenses full control over all aspects of the design, including furnishings, textiles, and landscaping. These commissions include the residences for Freeman A. Ford (1907), Robert Blacker (1907), David B. Gamble (1908), and William R. Thorsen (1909). These homes show the Greenses' enthusiasm for sculpted wood and Asian motifs to the fullest; all exhibit similarities in their emphatic presentation of joinery and structural beams, expansive and flowing plans, and their integration of exterior spaces through extensive sleeping porches, terraces, and balconies. Although much larger than the Greenses' relatively simple shingle and stone houses of the previous years, these structures maintained a similar intimacy that resulted from their uncluttered simplicity and the Greenses' fastidious attention to detail. Art glass lanterns, windows, and ceiling panels provided indirect lighting through naturalistic and stylized patterns that were echoed in furniture inlays of ebony, silver, and fruitwood, appliqué for curtains, and painted or carved friezes that highlighted the wood-paneled walls. In typical Arts and Crafts style, earth-tones of faded gold and browns predominated, intended to harmonize with the natural wood finishes seen through the interior and exterior. The impact of these residences was felt throughout the nation over the next several years, inspiring other architects to offer their own, often much more modest versions of the Greenses' California bungalows.

In 1910, following Charles's year-long visit to England with his family, the brothers began designing a number of structures that were ultimately never to be constructed. Within a few years, due to the extreme costs of their demanding craftsmanship, combined with the public's generally declining interest in the vocabulary of the Arts and Crafts style, the Greenses' work

began a gradual transformation. Following the completion of the Culbertson residence (1911) – their last commission which provided for complete interior furnishings – the brothers continued to work on an irregular basis. In 1916, Charles moved to Carmel, California to pursue other interests, and in 1922 their association was formally dissolved. During the 1920s, both brothers continued their independent work, often revising schemes for earlier clients. Charles continued producing designs for furniture, often highly carved with Chinese-derived imagery, while Henry concentrated on his architectural practice which began to exhibit the subtle influence of the Spanish Colonial Revival. However interesting, the work of their later years never equaled the complete vision and deft touch of their earlier bungalows which reflected a devotion to the supreme development of the Arts and Crafts home as a totally integrated environment.

Charles Sumner Greene. Born in Brighton, Ohio, 12 October 1868. Educated at Calvin Milton Woodward Manual Training School, St. Louis; studied architecture, Massachusetts Institute of Technology, Cambridge, 1888–91. Married Alice Gordon White, 1901: 5 children. Worked for architects H. Lawford Warren, then for Winslow and Weatherall, 1891–94. Visited England, 1901 and 1910–11. Established architectural partnership with Henry Mather Greene, Pasadena, California, 1894–1903, Los Angeles, 1903–06, Pasadena, 1906–22. Active as a designer of furniture and furnishings from c.1903. Moved to Carmel, California, 1916; practised independently as a designer of furniture from 1922. Died in Carmel, 11 June 1957.

Henry Mather Greene. Born in Brighton, Ohio, 23 January 1870. Educated at Calvin Milton Woodward Manual Training School, St. Louis; studied architecture, Massachusetts Institute of Technology, Cambridge, 1888–91. Married Emeline Augusta Dart, 1899: 4 children. Worked for architects Stickney and Austin, then for Shepley, Rutan and Coolidge, Boston, 1891–94. Established architectural partnership with Charles Sumner Greene, Pasadena, California, 1894–1903, Los Angeles, 1903–06, Pasadena, 1906–22; practised independently as an architect, Pasadena, from 1922. Died in Altadena, California, 2 October 1954.

Selected Works

The Greene and Greene Library and Archives, containing drawings, designs, company records and books, is held by the University of Southern California, Los Angeles. Examples of Greene and Greene's furniture are in the Gamble House, Pasadena, the Los Angeles County Museum of Art, and the Oakland Museum.

Interiors

- 1902 James A. Culbertson House, Pasadena, California (building and interiors)
- 1903 Josephine Van Rossem House, Pasadena, California (building and interiors; additions, 1906)
- 1903 Martha, Violet and Jane White House, Pasadena, California (building and interiors)
- 1904 Jennie A. Reeve House, Long Beach, California (building and interiors)
- 1904 Adelaide M. Tichenor House, Long Beach, California (building, interiors and furnishings)
- 1906 Theodore M. Irwin House, Pasadena, California (building, interiors and furnishings)
- 1907 Robert R. Blacker House, Pasadena, California (building, interiors, and furnishings)
- 1907 Freeman A. Ford House, Pasadena, California (building, interiors and furnishings)

- 1908 David B. Gamble House, Pasadena, California (building, interiors and furnishings)
 1909 Charles M. Pratt House, Ojai, California (building, interiors and furnishings)
 1909 William R. Thorsen House, Berkeley, California (building, interiors and furnishings)
 1911 Cordelia A. Culbertson House, Pasadena, California (building, interiors and furnishings)

The Greens designed furniture and furnishings for their buildings from c.1903; their furniture was executed by Peter and John Hall, and their stained glass by Harry Sturdy and Emile Lange.

Gropius, Walter 1883–1969

German architect and designer

After training as an architect in Charlottenburg and Munich, Walter Gropius entered the Berlin practice of Peter Behrens in 1907. Gropius subsequently acknowledged the significance of this apprenticeship, stating "I owe him much, particularly the habit of thinking in principles ... endowed with willpower and a penetrating intellect ... moved more by reason than emotion." These qualities also characterised Gropius's own approach to architecture and interior design after he established his own Berlin office in 1910.

In conjunction with Adolf Meyer, one of Gropius's first designs to attract international interest was the Model Factory built for the 1914 Deutscher Werkbund exhibition. In a radical

use of new materials, Gropius enclosed two corner staircases in a wall of glass. This marked an end to the division between interior and exterior in architecture, and a consequent unity between the building's interior space and surrounding environment.

The concern to resolve divisions – between arts and crafts, theory and practice – characterizes Gropius's teaching at the Bauhaus, where he was installed as Director in 1919. The principles that Gropius outlined in the first Bauhaus manifesto stressed the need for collaboration in solving design problems, the link between design and industrial technology, and "the common citizenship of all forms of creative work and their logical interdependence on one another."

This "benign regeneration of design" (Fitch 1960) fell into two important phases during Gropius's time at the Bauhaus. As Master of Form and Colour in the Technical Workshop from 1921 to 1925, he introduced the basic laws of design in relation to form, colour and proportion. Among the early successful products of the course were the first examples of Marcel Breuer's furniture, which combined innovative use of cheap, durable raw materials with an easy adaptability to commercial mass production.

When the school moved from Weimar to Dessau in 1925, Gropius oversaw the building of a new Bauhaus. All the functions of the school were combined under one roof, with the canteen, auditorium and theatre areas being noteworthy. In an economic use of space, these three rooms could be opened out into one large "play area" for social functions. The auditorium showed the collective subordination of all the arts to *Bauen* (building) incorporating Breuer furniture, lamps by the Technical Workshop, and murals by the Decorative Workshop.

In tandem with the design of the school, Gropius created five Masters' Houses nearby, to house the teaching staff. Here the corridor is done away with as an internal feature, with Gropius continuing to wrestle with problems of space and layout. Large windows along one wall made the rooms light and airy, with the placing of the furniture completing the "unity" of the interior according to the Bauhaus model. Breuer chairs were included, and cupboards and cabinets, made of different kinds of stained and polished wood, added to the visual stimulus for the inhabitant.

On return to private practice, Gropius embarked on the design of furniture for the Feder stores in Berlin (1929). Bauhaus features of easy assembly, standardized, interchangeable components, and the substitution of a handmade for an industrial finish, are prominent. Of equal significance was Gropius's appointment as Director of Design for the 1930 Werkbund exhibition in Paris, where his prototype for a high-rise flat was the centrepiece of a display of German industrial products. The hall, living room and study echo the Masters' Houses with their economic deployment of Breuer furniture, and a new feature was the open-work metal staircase.

Increasing political hostility from the Nazi government saw the tailing off of his practice and Gropius moved to London in 1934. Engaged by Jack Pritchard's Isokon company, Gropius completed buildings in partnership with Maxwell Fry, particularly Impington village school near Cambridge. When Isokon established a furniture subsidiary in 1935, Gropius was appointed Controller of Design. He exhibited prototypes for a sofa, armchair and mirror glass fireplace in Flat 37 at a

Gropius: interior of Sommerfeld House, with Adolf Meyer and Joost Schmidt, Berlin, 1920–21

Manchester department store, but none of these reached production. Elliott's suggestion that Gropius's spell in England was a "transitional phase", seeking to establish "a rational methodology for the solution of design problems", is apt (Elliott, 1974).

Gropius emigrated to the US in 1937 to take up a Professorship of Architecture at Harvard. He collaborated with Breuer in the construction of the Gropius house at Lincoln, Massachusetts, "shaping the patterns of life through building." The interior was entirely open-plan, providing for better air circulation, and large windows were again used to expand the interior space. The relationship of the interior to the surrounding environment was stressed by a colour scheme of white, grey, earth and red. The interior was kept cool by means of external overhangs, and almost all the fixtures were factory made, most strikingly the iron spiral stairway. Furnishings included Breuer's famous *Isokon* long chair.

Shortly after Gropius founded The Architects Collaborative (TAC) in 1946, he completed his first significant post-war design at the Harvard Graduate Center (1949–50). The layout of student dormitories, and the open-plan dining room and lounge at the heart of the building again reflects the experi-

ments in the Dessau Bauhaus, and Gropius's continuing insistence on inter-disciplinary cooperation and the exchange of ideas.

Focusing on his work with TAC from 1952, Gropius maintained his interest in industrial design, witnessed in the 1963 Rosenthal Ceramics factory at Selb, Germany. The interior of this prefabricated structure was laid out in a flexible manner so that the firm had space to incorporate future technical innovations. This layout eliminated inefficient use of space and any friction in the manufacturing process. At the same time, architectural stimulation was provided for the worker engaged on repetitive tasks, with the tiles of individual workshops painted in primary colours. Furthermore, a greenhouse, with trees, bushes, flowers and birds was incorporated in the centre of the factory space, to provide a natural counterpoint to the mechanistic environment.

Buildings like the Rosenthal factory underpin Gropius's reputation as an important pioneer of 20th century architecture, which often obscures his achievements in furniture and interior design. László Moholy-Nagy provided a most effective summary of Gropius's career in 1945, stating that "Fearlessly and uncompromisingly he defended the principles on which

the Bauhaus was built: that art and architecture which fail to serve for the betterment of our environment are socially destructive by aggravating instead of healing the ills of an iniquitous social system".

Biography

Born in Berlin, 18 May 1883. Studied architecture at the Königliche Technische Hochschule, Munich, 1903–07. Married 1) Alma Mahler (divorced); 2) Ise Frank; one daughter. Chief assistant to Peter Behrens (1868–1940), Berlin, 1907–10. Established his own architectural practice, Berlin, 1910; designed furniture and interiors from c.1913. Served in the military, 1914–18. Appointed Director, Staatliche Bauhaus, Weimar, 1919; Director, Dessau Bauhaus, 1925. Resumed private practice, Berlin, 1928; Vice-President, Congrès Internationaux d'Architecture Moderne (CIAM), 1929–57; moved to London and worked in private practice with Maxwell Fry, 1934–37; controller of design, Isokon furniture company, London, 1935. Settled in the United States, 1937; Professor of Architecture, Graduate School of Design, Harvard University, Cambridge, Massachusetts, 1937; Chair, 1938–52; Professor Emeritus, 1952. Worked in partnership with Marcel Breuer (1902–1981), 1938–43; established his own firm, The Architects Collaborative (TAC), Cambridge, Massachusetts, 1946. Published extensively on architecture and design. Received numerous honours and awards including: Royal Gold Medal, Royal Institute of British Architects, 1956; Gold Medal, American Institute of Architects, 1959; Grand State Prize of Architecture, 1960. Died in Boston, 5 July 1969.

Grottoes and Shellwork

A grotto is an artificial cave, either designed or decorated to simulate a natural cave, or to evoke the mythical associations of caves as dwelling places of the gods. Although most examples formed part of the garden and in this sense were exterior architectural features, several were adjoined to large houses or were installed in the basement levels, and most also served as semi-habitable rooms and included decorations made of pebbles and shells and specially designed furnishings.

Natural caves were traditionally identified with springs and the source of rivers, and their symbolic associations are well-known. They were represented in classical mythology either as the homes for gods and spirits, or as places of transition between this and other worlds. In the Christian era the cave became associated with the nativity and the tomb of the resur-

Grotto at Woburn Abbey, Bedfordshire, c.1630

rection, and with the ascetic tradition of the hermit, retired from active life for the purpose of contemplation.

In ancient Rome the artificial grotto was a familiar garden feature of the grander villa. Grottoes were traditionally built as places of cool retreat from the heat of the day, for rest or contemplation, sometimes as banqueting rooms, often with fountains. The taste for both rustic grottoes and the more formal architectural “nymphaea” – shrines dedicated to nymphs – was revived in Renaissance Italy, as part of the wider revival of the ideal of classical civilisation. Popular features of larger-scale gardens in France and Germany, and throughout Europe, in the 16th and 17th centuries, grottoes became an essential ingredient of the picturesque landscape garden in England, when they were prized for their classical associations and evocation of the “Sublime”.

The appeal of the grotto has always been the expressive use of natural materials in its decoration: natural rocks, shells, minerals and glass, as well as water. The delight of the patron or designer was found chiefly in the ingenuity with which natural aesthetic effects could be recreated, and new aesthetic effects created by using natural materials or forms. John Woolridge in *Art of Gardening* (1677) observed the

Mediterranean tradition of the grotto and recommended it to the English “to repose ourselves in the time of our summer faint heats” ... “it is a place that is capable of so much pleasure and delight, that you may bestow not undeservedly what cost you please on it by paving it with marble or immuring it with stone or Rock-work either natural or artificial to resemble the excellencies of nature”. Nature was tamed, and at the same time its wildness and irregularity celebrated in such schemes. One famous description appears in Alberti’s treatise *De re aedificatoria* (1485): “the ancients used to dress the walls of their grottoes and caverns with all manner of rough work, with little chips of pumice or soft Tybertine stone which Ovid calls the living pumice: and some I have known daub them over with green wax, in imitation of the mossy slime which we always see in our moist grottoes. I was extremely pleased with an artificial grotto which I have seen of this sort, with a clear spring of water falling from it; the walls were composed of various sorts of sea-shells lying roughly together, some reversed, some with their mouths outwards, their colours being so artfully blended as to form a very beautiful variety.”

The evidence of ancient ruins and the references to grottoes in classical literature were the sources for the design and deco-

ration of the grottoes of the Italian Renaissance. The same central themes therefore applied: the associations with water; iconographical associations with nymphs and sea gods; irregular rock forms, even if confined to the central fountain; and the purpose of the grotto as a place of retreat and contemplation.

An important surviving example of the grotto of the later 16th century, designed by the Mannerist architect Bernardo Buontalenti (1531–1608) is the Grotta Grande (1583–93) of the Boboli Gardens, in Florence, which was completed for the Grand Duke Francesco I de' Medici. The external form was classical, a central arched opening beneath a triangular pediment. The edges and outline of this classical form were deliberately disordered with irregular artificial incrustation. Within, a series of smaller grottoes were connected by a passage. In the first were placed four sculptures, "rough hewn" figures of slaves, by Michelangelo; in the third grotto there was a mosaic wall fountain with the figure of Venus by Giovanni da Bologna. And "it is only when the eye has grown accustomed to the dim light that it becomes aware of the countless shells on the pedestals of the statues and on the walls" (Lotz, 1995). It was a bizarre and new creation, drawn with reference to the imagined classical past; indeed it appeared almost to have emerged from the ground as an excavation. According to Naomi Miller, "the overwhelming impression is that of a ruin resurrected; it is the *idea* of antiquity incarnate" (Miller, 1982).

Consistently popular as garden features throughout Europe in the later 16th and 17th century, the grotto was usually part of a highly formal symmetrical garden arrangement or at the end of a walk or vista – such as the Grottoes of Venus and Diana (1560–75) in the Villa D'Este at Tivoli. They were also important settings for sophisticated fountains and waterworks as in the magnificent architectural Grotte de Thetis at Versailles, built 1664–72. It was in England in the 18th century that the grotto became a popular feature of the "picturesque" landscape movement. As in the Renaissance period, the evocation of the classical world was important, but at the same time the irregular naturalistic qualities were increasingly valued. An external form would sometimes be almost hidden in the landscape, "a rude structure" seemingly carved from rock, while within the grottoes might be gloriously decorated with shells, flints and other minerals. The taste for the "Sublime" experience in the mid 18th century was stimulated by the contrasts and ambiguity of the grotto, curiosity and "astonishment" combined.

The grotto built by the poet Alexander Pope at Twickenham between 1719 and 1725 was one of the first fashionable grottoes of this period. It was a place of contemplation, and at once a challenge to the senses and an inspiration to the spirit, rich in classical allusion. Pope's grotto was, and is, entirely subterranean. It was described by an anonymous contemporary in 1747:

The grotto is an irregular vault and passage, open at both extremities, and further illuminated by two windows to the front. In passing along it, we are presented with many openings and cells, which owe their forms to a diversity of pillars and jambs, ranged after no set Order or Rule, but aptly favouring the Particular designs of the place; they seem, as roughly hew'd out of Rocks and Beds of mineral strata, discovering in the fissures and angular breaches, variety of flints, spars, ores, shells, etc.

The visual impression for the visitor was not, however, static. First, water was observed: "among [the minerals and ores] the stream issuing from the spring of water .. distributed to a diversity of purposes". Second, "to still more increase the delight" pieces of mirrors had been concealed in obscure places to reflect, as Pope himself wrote in a letter to a Mr. Blount in 1725, "a lamp .. [which when] .. hung in the Middle, a thousand pointed Rays glitter and reflected over the place".

The 18th-century English grotto could also serve as an element in an iconographic sequence as in the landscape gardens at Stourhead, in Wiltshire. These gardens were laid out for the banker Henry Hoare in the 1740s, with a series of garden buildings and temples in the classical idiom. Intended to inspire contemplation, they culminated in a dramatic circular and domed grotto (1748) built of ancient-looking dark-coloured tufa rock – the grotto survives today. The floor was made of pebbles laid in concentric patterns, and within the central chamber lay the figure of a sleeping nymph, in painted lead, over a spring pool with a continual cascade – Hoare referred to the grotto as "the temple of the nymph". A second figure within the grotto complex – a finely modelled figure of a River God by Cheere – prompted this observation from Horace Walpole: "the most fortunately placed grotto is that at Stourhead where the river bursts from the urn of its god, and passes on its course through the cave".

Grottoes were often decorated with shells and stones. Professionally executed shell decoration was popular in France from the 16th century and numerous examples of Nymphaea and grottoes whose walls were encrusted with shells followed. One of the earliest such edifices was the grotto in the Bastie d'Urfé (1535) whose interior was covered with arrangements of shells and pebbles. Later examples included the Nymphaeum of the Maisons-Lafitte (1642), designed by François Mansart, and the shell cottage in the royal park at Rambouillet built by the Duc de Penthièvre for his widowed daughter-in-law, the Princesse de Lamballe. Known in the 1730s as *rocaille*, shellwork was used both as a decorative material, covering walls and surfaces with a rough, irregular finish, and as an inspirational motif in ornament and design. The engravings of designers such as Juste-Aurèle Meissonnier illustrate many types of *boiseries*, wall decoration, frames and other carved decoration whose curved, scallop shapes clearly echo those of shells. And as forms such as rocks, corals, and shells became more popular, *rocaille* effectively gave its name to the new style of interior decoration known as Rococo that emerged in many parts of Europe from the second quarter of the 18th century.

However, it was in England that the passion for shell decoration really took hold. It was frequently carried out by enthusiastic amateurs. Mrs. Delaney, one of the principal arbiters of taste in the mid 18th century, often referred to the new fashion for shell-collecting and for decorating summer-houses and grottoes with shells gathered on beaches in her letters. "I have got a new madness, I am running wild after shells", she declared and went on, "the beauty of shells is as infinite as flowers, and to consider how they are inhabited enlarges a field of wonder that leads one insensibly to the great Director and author of these works".

There is perhaps no better example of the "madness" for shells than the incomparable shellwork grotto at Goodwood in

Sussex (1739) which was obsessively decorated by Sarah, Duchess of Richmond and her daughters. Thousands of shells were used, many collected in the South Seas by Captain Knowles of HMS *Diamond*, and shells covered the entire room – including the remarkable vaulted and coffered ceiling – with geometric patterns and motifs of stars and flowers. A similarly striking interior, containing unique hand-made decorations of feather and shellwork was made by the Misses Jane and Mary Parminter for their cottage orné, A La Ronde in Devon (1810–11), and such is the sophistication of these schemes that it is hard to credit that they were done by amateurs.

By the middle of the 19th century grottoes and shellwork interiors had become curiosities and represented a popular middle-class tourist attraction. Shells themselves, however, continued to serve as the inspiration for furnishings well into the 20th century. Thomas Chippendale's *Director* had illustrated several examples of fanciful scallop and shell chairs, and shellwork also appeared on some of the early 19th century furniture in the Brighton Pavilion. But it was in the 1920s and 1930s that such furnishings once again became fashionable. The French *couturier*, Helena Rubinstein's neo-Rococo Paris apartment included some extravagant examples of chairs designed by André Mare in the form of a shell and finished in lacquered silver leaf, and distorted shell-shape furniture and sculptures appeared in several Surrealist and neo-Baroque settings of the 1920s and 1930s. More recently, shells and pebbles formed an important feature as table arrangements in David Hicks's interiors of the 1970s.

Selected Collections

Notable examples of grottoes and shellwork interiors in England survive at A La Ronde, Devon, Goodwood House, Sussex, and Woburn Abbey, Bedfordshire; in France at the Bastie d'Urfé, Maisons-Lafitte, Château Rambouillet, and the Nymphaeum, Jouy en Josas; in Germany, at the Schloss Nymphenburg, and the Alte Residenz, Munich, and the Weissenstein Palace, Pommersfelden; and in Italy in the Boboli Gardens, Florence, Villa Castello, Florence, and the Villa Giulia, Rome.

Further Reading

A detailed discussion of the development and fashion for grottoes in Britain, including a gazetteer, appears in Jones 1974; information on Italian and Renaissance grottoes can be found in Miller 1982 and Lazzaro 1990. For a recent survey of the use of shellwork in interior decoration and furnishings see Mauries 1994.

Guimard, Hector 1867–1942

French architect and designer

Hector Guimard was the most important and original French exponent of the Art Nouveau style in architecture – which, with characteristic assurance, he termed "Style Guimard." His most famous designs are the sinuous cast-iron entrances to the Paris Métro stations (from 1900), yet the interiors which he created for residences and apartment buildings are among his most compelling and coherent statements. Like his Belgian contemporaries Victor Horta and Henry van de Velde, Guimard insisted that a structure's interior and exterior create a unified expression, and he was not content to leave this unity to chance. Whenever possible he designed not only fireplaces, window grilles, and banisters for his buildings, but also their hardware, wallpapers, curtains and furnishings. The enveloping totality of his interiors might have been stifling except for Guimard's mastery of taut line and soft color. His best rooms were sinewy and light, held in tension with their own peculiar rhythmic logic.

As a young man, Guimard was attracted to Viollet-le-Duc's interpretation of the Gothic revival. He did not really find his stride until 1895, when he visited Horta's Hôtel Tassel (Brussels, 1893). His interiors for the apartment building Castel Béranger (Paris, 1894–98) were completely reworked upon his return and directly incorporated many of Horta's ideas, particularly his extensive use of iron, stained glass and smooth, fluid forms inspired by plant-life. Both Guimard and Horta disdained naturalistic floral or leaf ornament, preferring the abstract linear character of stems, stalks and branches. But whereas Horta's whiplash line is consistently urgent, abrupt and quick, Guimard's is languorous and vegetal, its brief rushes interrupted with curled, knotted pauses like the growth

nodes of a stem. His characteristic branching ornament is both powerfully suggestive and unfamiliar: as a result, his interiors create the impression of a comprehensible alien world. Inspired by Viollet-le-Duc, Guimard aspired to use modern materials “honestly” – he often, for example, left the rivets in his iron-work visible. He also experimented with unusual combinations of materials for textural or pictorial effect. However, his designs – which were usually conceived as drawings or clay models – make it clear that materials were always secondary to “Style Guimard.”

The vestibule of Castel Béranger was dominated by a fantastic, asymmetrical wrought-iron gate, but its overall effect depended on a complex confluence of elements: iron pilasters snaking upward into arches; stained-glass windows, sheet-metal strapwork, and mosaic floor tiles which echoed the gate’s undulating line; and ceramic wall panels in thick, swirling relief. Glazed in coppery green, these panels lend a cool, dark, grotto-like quality, and their indefinite design seems almost to have been frozen in mid-swell. In the stairwells, Guimard installed irregular grids of glass brick. His distinctive line found its way into the Castel’s stair carpeting, wallpapers and embossed Lincrusta-Walton wall panels, fireplaces, mouldings, even the doorknobs and lockplates. Much of the iron and woodwork was painted, and the hand-tinted plates in Guimard’s album promoting the Castel recall its soft palette of peach, sage green, pine, dusky gold, pale blue and yellow against white. The surviving stained glass, while more vivid, is in similar hues. One of Guimard’s first tenants, the painter Paul Signac, described his new home as “Eccentric ... but gay, practical and bright.”

For the Maison Coilliot in Lille (1898–1900), Guimard used warm, strong yellows, greens and blues, and wrapped the hallway with enamelled lava blocks whose incised patterns were related to the enamelled iron panels in the Métro entrances. These rough blocks offered a textural contrast to the hall’s rippled stained glass, carved woodwork and moulded stucco. The fireplace for Maison Coilliot was also made from lava, glazed tawny gold and fitted with a strikingly elaborate cabinet in pearwood with enamelled glass. Two shelf units flanked the fireplace, and slender vining supports rose from these to a broad, glassed cabinet that spanned the chimney’s width. Twining above this, the supports terminated in small curved shelves for art objects. Guimard rarely designed new forms, but his vigorous, elastic line could transform clichés like the Victorian parlor cabinet into remarkably original pieces. His use of asymmetry, moreover, was carefully balanced. A few exceptions verged on the bizarre: a bench for Castel Béranger had a high, serpentine back which incorporated display shelves and a small corner cabinet, and several of his sideboards and overmantels also sprouted shelves from thin, branching extensions. These rank among his most dramatic linear gestures, with an exuberance comparable to the Métro streetlamps.

In general, however, Guimard’s furniture was surprisingly restrained. His own desk, an L-shaped wedge laid over two independent cabinets, has sometimes been admired as a precursor of modern Functionalist furniture. The vigorous, grasping arms of his boudoir chairs express muscle as graphically as the best Rococo examples; and his dining chairs use their structure as line, spilling over in wave-like carved flourishes at critical junctures. On beds and wardrobes, Guimard confined orna-

ment to the edges and corners, leaving wide expanses untouched. The looping cast-metal hardware was always of his own design. Although the Castel Béranger furniture was mostly mahogany, he later turned to fruitwoods (especially pear), whose fine grain responds well to carving. The quality of cabinetwork produced in his studio was consistently excellent. Guimard’s perfectionism and intricate designs, of course, resulted in very steep prices.

While not technically built-in, the Maison Coilliot fireplace cabinet was clearly custom designed. Guimard also offered furniture of his own design to tenants at the Castel, an option he later provided only for private residences. The Castel Henriette in Sèvres (1898), Hôtel Nozal (1902) and Hôtel Mezzara (1910; both Paris) were among the most important commissions for which Guimard provided furnishings. He equipped Castel Henriette’s dining room with a table and chairs, a tall chandelier cradling both candles and electric light in a teardrop-shaped cage, and a massive sideboard and overmantel which grazed the moulded stucco frieze. Later cabinetwork was more unified: the lower two-thirds of his own oval dining room (Hôtel Guimard, Paris, 1909–12) were fitted with continuous pearwood panels which incorporated shelves, a mirrored cabinet with an inset marble shelf, and a china cupboard with glass doors. Although richly carved, the panels and cabinets – now housed in the Musée des Arts Décoratifs, Paris – flow gently into one another, without the spiky tendentious quality seen in Guimard’s earlier furniture. Above them, an embossed frieze was set below long tongues of moulded stucco ornament. In the center of the room hung a chandelier with two layers of beaded fringe, and the windows were draped with open mesh curtains to reveal the stained glass. The carpet was decorated with an all-over composition of interlaced line. This reserved, luxurious interior in Guimard’s mature style was in stark contrast to those in the Castel Béranger.

Photographs reveal Guimard’s eclectic use of decorative objects and floral arrangements, which was entirely in keeping with Aesthetic taste. The shelves in his office were filled with small figural sculptures, vases and ripe, informal bouquets; a landscape painting hung inside the overmantel. For staged photos of Castel Béranger’s apartments, he hung striped cotton or lace curtains and a Toulouse-Lautrec poster, placed a Japanese figurine in a mantel niche, and set cushions and potted palms on the floor. Guimard placed his own vases – the ancestors of his designs for Sèvres – alongside gracefully dishevelled piles of books.

Perhaps Guimard’s most intriguing interior was the auditorium of the Humbert de Romans (Paris, 1897–1901), designed as a concert hall. A broad octagon, its exposed, branching steel structure brilliantly evoked both a forest and a cathedral while preserving its essentially industrial character. The steel supports were veneered in red mahogany, and the ceiling was decorated with moulded ornament painted in graduated shades of orange. Electric light bulbs hung in floral clusters from the corners of the open structure. Unfortunately, the little-used auditorium was demolished some time between 1905 and 1908.

Guimard hoped personally to inspire a renaissance in French architecture and design, but his ambition was doomed to fail. Nevertheless he remained faithful to the “Style

Guimard." His last Paris building, an apartment house, was completed well past the flowering of Art Nouveau in 1928.

Biography

Hector Germain Guimard. Born in Lyon, 10 March 1867. Studied at the École des Arts Décoratifs, Paris, 1882–85, and subsequently at the École des Beaux-Arts, Paris. Married Adeline Oppenheim, 1909. In practice as an architect from 1888; and designed a full range of furnishings, including furniture, ironwork, carpets, stained glass and wallpaper, from c.1890. Travelled in England and Belgium, 1894–95, meeting Victor Horta and Paul Hankar in 1895. Commissioned to design the entrances for the Paris Métro from 1900. Participated in many national and international exhibitions including the Exposition Universelle, Paris, 1900, the Paris Exposition de l'Habitation, 1903, and the Exposition des Arts Décoratifs et Industriels, Paris, 1925. Founder-member of the Société des Artistes Décorateurs; exhibiting from 1904 and Vice-President, 1905. Taught at the École des Beaux-Arts, Paris, from 1896. Chevalier de la Légion d'Honneur, 1929. Moved to New York, 1938. Died in New York, 20 May 1942.

Selected Works

A vast collection of designs, drawings, watercolours and manuscript material – known as the Fonds Guimard – is in the Musée des Arts Décoratifs, Paris, which also contains an important collection of Guimard's furniture. Additional collections of furniture, including work from the Hôtel Guimard, are in the Musée des Beaux-Arts, Lyon, and the Musée d'Orsay, Paris, whose holdings also include examples of Guimard's designs for metalwork, lighting and stained glass. A collection of architectural drawings is in the Avery Library, Columbia University, New York, and the Cooper-Hewitt Museum, New York, contains examples of Guimard's textiles and archival material relating to his work. A collection of drawings and a copy of *Le Castel Béranger*, including 65 colour plates and numerous archival photographs of the interiors, is in the Bibliothèque des Arts Décoratifs, Paris.

Interiors

- 1888 Au Grand Neptune (restaurant), quai d'Auteuil, Paris (interiors)
- 1893 Maison Jassédé, avenue de Clamart (now avenue Charles de Gaulle), Paris (building, interiors and furnishings): Charles Jassédé
- 1894–98 Castel Béranger, Paris (building, interiors and furnishings): Elizabeth Fournier
- 1897–1901 Salle Humbert de Romans, Paris (building, interiors and furnishings)
- 1898–1900 Maison Coilliot, Lille (building, interiors and furnishings): Louis Coilliot
- 1898–1900 Castel Henriette, Sèvres (building, interiors and furnishings): Mme. Hefty
- 1902 Hôtel Nozal, Paris (building, interiors and furnishings)
- 1903–05 Jassédé Apartment Building, Paris (building, interiors and furnishings)
- 1905 Castel Orgeval, Villemoisson, near Morsang-sur-Orge (building, interiors and furnishings)

- 1909–12 Hôtel Guimard, 122 avenue Mozart, Paris (building, interiors and furnishings): Hector Guimard
- 1910 Hôtel Mezzara, Paris (building, interiors and furnishings)
- 1930 La Guimardière, Vaucresson (building, interiors and furnishings; incomplete): Hector Guimard

The majority of Guimard's buildings included custom-made furniture, metalwork, textiles, wallpapers and stained glass. He also designed porcelain for the Sèvres manufactory between 1899 and 1904, tiles for Alexandre Bigot, c.1902, and ironwork made by the Fonderies de Bayard et Saint-Didier, c.1907.

H

Habitat

British home furnishings retailer and manufacturer;
established 1964

Habitat, an international chain of home furnishing stores, was founded with the incorporation of Habitat Designs Ltd. on 14 January 1964. The first Habitat shop, which opened to the public on 11 May 1964 at 77–79 Fulham Road, London, was situated in the ground floor and basement of a new development “at the junction of Sloane Avenue and Fulham Road” and sold furniture, kitchen goods, fabrics, carpets, china and glass under the banner of “good practical design”. It brought with it an innovative approach to retailing which equated furnishing with fashion by rejecting the formal and often dreary environments of traditional furniture stores in favour of exciting “modern” design, in-store music, amateur staff and self-selection shopping.

The influences on Habitat ranged from Mary Quant’s Bazaar boutique and Woolland Brothers’ Modern Interiors department in Knightsbridge to Madame Cadec’s cookware shop in Soho, Heal’s furniture in Tottenham Court Road, Abacus in Dunmow and numerous other boutiques around London such as Primavera on Sloane Street. Comparable developments to Habitat in Europe and North America would include Design Research in Boston and IKEA in Sweden.

The founders of Habitat Designs Limited (who included Terence Conran, the designer and manufacturer; Caroline Conran, the former home editor of *Queen* magazine; Pagan Taylor, a former fashion model; and John Mawer, the managing director of Conran Furniture Limited) were inextricably linked to London’s post-war culture of art, design, fashion and journalism and sought to bring the glamour of magazine “lifestyle” into the home via the high street. Large plate glass windows extending from floor to ceiling presented the shop directly to the street like a double page spread from a colour supplement. The shop’s immediate success was partly due to the visual integrity of the shop’s Corbusier-style interior design – by architect Oliver Gregory – and its imaginative warehouse-style displays of super-abundant merchandise.

Habitat goods included sturdy modern British furniture manufactured in pine and ash by Thetford-based Conran Furniture Limited; colourful striped and floral textiles produced by Conran Fabrics Limited; modern furniture and

tableware from Scandinavia and Italy; bentwood and “rustic” furniture; traditional French cookware; Polish enamelware; Afghan rugs and coir matting; Japanese paper lanterns; German audio equipment; and Swiss tablelights.

A press release of the time announced, “We hope we have taken the footslogging out of shopping by assembling a wide selection of unusual and top quality goods under one roof” indicating the previously disparate nature of such goods and crucially how the “editing” process of magazine production might constitute a retailing philosophy. The editor-in-chief of Habitat was Terence Conran who chose goods for the arbitrary qualities of “good design”, “good taste”, and “good living” – criteria derived variously from 19th-century design reform, Bauhaus functionalism, Elizabeth David’s *French Provincial Cooking* and Design Council rhetoric.

In 1966 a second Habitat shop opened in London at 156–158 Tottenham Court Road. This followed a similar scheme to the Fulham Road store by occupying the ground floor and basement of the building and keeping the space light and airy. Walls and ceilings were painted white, tiled floors were covered in coir matting, white painted brick piers supported natural beech shelving and stock was displayed on simple trestle tables and white painted metal towers. The interior design scheme and merchandise of Habitat suggested a vision of domestic living which was transferable from the shop to the home and vice versa. A vision which mixed modern with traditional, high design with vernacular crafts, and urban with rustic. The often highly coloured Pop merchandise, which had first emerged in Carnaby Street boutiques such as Gear, contrasted starkly with the white and natural background of the shop.

In 1969, by which time there were five shops in England and one in Toronto, Habitat merged, through H.J. Ryman Limited, with Lupton Morton Furniture, a private mail-order company based at Wallingford in Oxfordshire, which manufactured simple, modern domestic furniture with names such as *Campus*. These designs were incorporated into the Habitat range and formed the basis of a new mail-order catalogue called *Creative Living: Habitat by Post*. The range of goods expanded accordingly to include toys, gardening equipment and electrical appliances which prescribed a clearly defined middle-class lifestyle. The company also began to engage with the cult of DIY (do-it-yourself) by introducing decorating tools

Habitat: an early brochure

and materials, a new range of Habitat paints in 16 colours, simple whitewood furniture, wall hessian and cork tiles.

The second annual Habitat catalogue, published for 1971, was supported by an advertising campaign running across broadsheet newspapers and magazines such as *House and Garden*, *Nova* and *Good Housekeeping*. The layout for the catalogue went "from one room's furniture and accessories to another – just like walking through a house" and established a format which continued annually until 1989. The third annual catalogue of 1972 included "specially commissioned prints by David Hockney and Peter Blake", Lollo foam furniture, Tefal non-stick saucepans and "a smoked acrylic digital clock" – goods which proposed a lifestyle that engaged with contemporary art and modern technology. The Pop minimalism of this era is evoked by the work of David Hockney and bears direct comparison with the art direction of Habitat in the early 1970s. At the same time the particular aesthetic of art gallery spaces began to shape the scenography of domestic interiors in the catalogue.

In 1973 the first Habitat shop on Fulham Road was trans-

formed into The Conran Shop – "a super elegant design store specialising in the more expensive end of the home furnishing market" – while Habitat moved into the former Gaumont Palace cinema on the Kings Road. In the same year the first French Habitat opened in Paris through a relationship with Prisunic and an acclaimed high-tech warehouse shed was designed and built by architects Ahrends Burton Koralek at Wallingford, Berkshire.

Through the 1970s new stores opened across the UK, USA, France and Belgium. The first American Habitat – named Conran's – opened in New York in 1977. Designed like a supermarket with wide aisles and a row of check-out tills, Conran's brought take-away and flatpack furniture into an arena that preferred home delivery and high levels of customer service. Nevertheless the chain expanded across the East Coast with moderate success until closing in 1992.

In 1981 Habitat was floated on the stock exchange and in 1982 it was merged with Mothercare to form the Mothercare/Habitat Group plc. The group was enlarged by the subsequent acquisition of Heal's and Richard's in 1983. In 1986 the

Habitat / Mothercare Group merged with British Home Stores to form Storehouse plc. Ironically the “designer decade” was a low point for Habitat in terms of product design and quality, though the company retained the slogan of “good design at good prices”. Out-of-town retail developments increasingly became the focus of corporate strategy which further eroded the company’s credibility as a design-led retailer.

In 1990 Terence Conran left Storehouse whence a new merchandising and marketing division, Habitat International, was set up to introduce new product designs, global sourcing and central buying in an attempt to gain economies of scale and an international brand image. The mail-order operation was closed down and the annual catalogue was briefly replaced by a lower pagination seasonal “magalogue”. Through the 1990s Habitat has made a steady return to the centre of the home furnishing arena by responding to changes in fashion and maintaining an emphasis on style and quality rather than design and price. In 1992 Habitat was bought by the Amsterdam-based Stichting Ingka Foundation which has invested in a comprehensive program of store refurbishments, re-locations to in-town sites and high quality catalogues.

Selected Works

Archive collections documenting the history of Habitat from the 1960s to the 1990s are in the National Archive of Art and Design, Victoria and Albert Museum, London. The most important of these is the Habitat UK Ltd. Archive, which consists of 130 boxes of material including press cuttings, a complete run of the company’s catalogues, photographs of products, printed material, in-house magazines, printed ephemera, books, photographs and video tapes. Additional documentation is in the John Maltby Archive which contains the photographs and daybooks of the photographer regularly commissioned by Terence Conran during the 1960s, and in the Paul Reilly collection of speeches and articles, which includes the speech given at the opening of the Conran factory in Thetford.

Halls and Vestibules

Domestic halls originated as secular meeting places presided over by community leaders, nobility and royalty in the early Middle Ages. Halls evolved to fulfil a diversity of functions: reception space, living room, dining room, assembly room, games room, music hall, court, council room and parliament.

One of the earliest surviving halls is the throne room of King Ramiro I of the Asturias at Naranco in Spain, dating from the 9th century. It is fairly small in dimension, with doors that open to loggias at either end for addressing assemblies. “Great” halls of this type were the most important rooms in medieval princely or noble residences and quickly became the epicentre of all substantial households in medieval Europe. They varied enormously in size, ranging from the vastness of Westminster Hall (239 by 67 feet) to the more compact Oakham Hall in Rutland (65 by 44 feet). Early medieval halls were vaulted and aisled like churches until more sophisticated joinery practices allowed wide span roofs, first arch-brace and later hammer beam in construction, negating the need for supporting colonnades regardless of the hall size. Within these halls, European kings, princes and noblemen administered justice, presided over matters of state and hosted huge receptions as well as community festivities. Guests were entertained with great ceremony and the scale of the entertainment and lavishness of the hospitality was a direct reflection of the status, wealth and generosity of the householder. As the main room of the house, castle or palace, the hall was also the room in which the entire household (sometimes as many as 200 people) ate and slept, although the lord and his family had private rooms off the main hall into which they could retreat. At mealtimes, the householder and his guests sat at one end of the hall with their staff before them. From the 13th century it became customary for the lord’s table to be raised on a platform / dais so that he was clearly visible to all in the room.

The layout of medieval halls was in essence geared to the moment when the lord and his household sat down to eat together. The entrance from the kitchen was customarily at the end of the hall opposite to the family’s table and was deliberately grand. At Penshurst Place in Kent (1341), for example, it consisted of a series of three large arches through which the food was carried in a ceremonial procession the entire length of the hall to the lord’s table. At Dartington Hall in Devon (1390), there were also three arched entrances to the hall, the central one from the kitchen, and the flanking two from the pantry where bread was stored and from the buttery where beer and candles were dispensed. Towards the end of the 14th century these “triumphal” arches were frequently screened off to exclude draughts from the kitchens. Initially these screens were moveable, but they soon became a permanent, ornamental feature taking over the role of the arches as ceremonial entrance passage. As they were set slightly away from the entrance and were beautifully carved and extremely solid in

Halls: Great Hall, Shiplake Court, Oxfordshire, by George & Peto, 1891

structure, the next logical stage in their evolution was to construct a music gallery over them, so that the food could enter the hall to a fanfare of music, and so that music could be played after the meal for the entertainment of those present.

Hall fireplaces evolved in a similarly dramatic way to the kitchen entrance, especially on the Continent where the medieval functions of the hall persisted longer than in Britain. Fireplaces were usually built along the longest wall in the hall – halls in the early Middle Ages were heated by fires in the centre of the room, the smoke being released via a louver in the roof – and evolved as increasingly ornate showpieces. The great hall at Poitiers Castle (1384–88), for example, had an elaborately carved triple fireplace, topped by a screen of arches, perforated by glazed tracery, and a balcony. Equally impressive was the fireplace in the hall of Jacques Coeur's house in Bourges (1443) which was of staggering proportions and boasted ornamental detail, including turrets, and a carved frieze of huntsmen, knights and donkeys. Medieval halls were customarily hung with tapestries and other movable treasures. Weapons and shields bearing coats of arms were also displayed. Their presence was essentially practical – to arm the lord's knights in the event of a crisis and to keep track of the weaponry stock as many were quite valuable – but they also served as decoration.

Although the great hall persisted as a dining area throughout the 16th century, the lord and his family had retreated from the communal mealtimes into private chambers by the 14th century, a trend first established by royalty. In the absence of the lord, his senior staff occupied the high table. The gradual retreat of the householder from the communal sphere to his great chamber above the hall reinforced existing hierarchies. It set the householder apart from his staff, who were now quite literally beneath him at mealtimes, and the dimensions of the great chamber increased at the expense of those of the great hall as a result. At Hardwick Hall in Derbyshire (designed in the 1590s by Robert Smythson for Bess of Hardwick) the hall, though monumental in scale and rising over two floors, was considerably smaller than the great chamber. Here Bess of Hardwick dined in state and received royal envoys in the most lavish of circumstances. The hall still functioned as the servants' dining room and Bess of Hardwick's absence from meals was compensated for by an enormous coat of arms over the fireplace, flanked by two full-sized plasterwork relief stags.

The great hall at Hardwick had other notable characteristics that set it apart from other contemporary interiors. Hardwick was designed with very narrow side elevations and the hall runs the entire width of the building, along the central axis, with rooms arranged on either side and above it. The ceiling is flat, an unusual feature, due to the rooms above, and the traditional wooden screen / music gallery was replaced by a screen supported by four carved Doric columns, derived from an engraving by Sebastiano Serlio. This music gallery also served as a connecting passage between the private dining and withdrawing rooms on the first floor from which Bess could monitor the activities of her staff.

Despite its monumental proportions, Hardwick had an unusually rational and sophisticated plan. The rationalisation of the English country house interior as a reflection of the architectural order of the exterior became more widespread in

grand houses following the Restoration of the monarchy in the latter half of the 17th century. This was partly due to the influence of foreign models. Dutch houses were particularly influential as their compact practical solutions to domestic life, sweeping the servants' quarters and service rooms into the basement or below stairs, combined well with the stylistic vocabulary of Palladian classicism in English country houses. Also, the combined effects of economic restrictions and the fact that the rich often had responsibilities at court, necessitating properties in town as well as in the country, meant that households generally became smaller. Where possible, house plans were symmetrical, with the most important rooms at the centre. Halls became smaller to the extent that some were mere vestibules, neat reception areas for visitors and tradesmen as was common in European homes. The marble hall at Petworth, Sussex (1692) is an example of such a continental-style vestibule; its modest dimensions appear slightly out of place in the otherwise huge house.

In spite of such economies of scale, small vestibules did not become widespread in England due to the popularity of the symmetrical French formal house plan in the early 18th century. The French plan concentrated the public rooms of the house along the central axis, with state and private apartments arranged in symmetry to either side. An early application of elements of the French plan, a "state centre" with flanking apartments, can be seen at Coleshill House, designed in 1650 by Roger Pratt for his cousin Sir George Pratt. At Coleshill, the hall rises over two storeys and is connected to the great chamber on the first floor by a staircase. Once the servants had been banished from the hall, however, the householder and guests no longer needed to dine symbolically above them and the great chamber, renamed the Saloon after the French term *salon* and the Italian *salone*, could be placed on the same level as the great hall. The great hall was itself raised above ground level on the *piano nobile*, necessitating a grand staircase at the entrance of the house.

It was the architect Sir John Vanbrugh who exploited the formal continental plan to its fullest and most ostentatiously Baroque potential. He created a hall of epic proportions at the Duke of Marlborough's house, Blenheim in Oxfordshire (1705–20). It is topped by a clerestory lantern, 67 feet high, decorated with painted military trophies and a painting depicting the apotheosis of the Duke in commemoration of his outstanding military career. The hall had a music gallery high above the entrance to the saloon, as was traditional. The hall was used for huge gatherings at seasonal festivities, while the saloon was used for more stately occasions. The great hall at Castle Howard, also by Vanbrugh, is equally theatrical, although inspired by a musical as opposed to military theme. The richly painted and decorated hall is crowned, cathedral-style with a dome and cupola.

The dramatic scale and exuberance of Baroque architecture was never completely accepted in England, but Lord Burlington's revival of Palladian architectural principles proved more palatable as they revisited an architectural vocabulary that had already been established in the previous century by Inigo Jones. The basic plan of the formal house did not change however, simply the stylistic vocabulary and the relationship of scale and proportion. The stone hall at Houghton Hall in Norfolk, designed for Robert Walpole by Colen

Campbell and William Kent in the early 1700s, was a perfect cube rising, as was customary, over two storeys. The hall was decorated with stone carvings and high relief plasterwork, consisting in part of hunting imagery as Houghton was mainly used as a hunting lodge by Walpole and his political allies. By the mid 18th century, the aristocracy and professional classes socialised more readily in the public assembly rooms in fashionable town and city centres. The formal house plan, therefore, became less important as attitudes towards individual room functions became more flexible due to the slight relaxation of social convention. Yet, although people enjoyed socialising outside the domestic sphere, assemblies were also given at home, with dancing, music, tea and cards after dinner. The state rooms of private houses were opened up to provide the assembly space, effectively creating a circuit of rooms around a first floor balcony. In town houses where space was at a premium, the hall was marginalised and the stairs from the hall to the first floor became a more important feature, and were often situated in the centre of the house.

The compact town house plan with its small hall and dominant staircase circuit was easily adapted to equally compact country houses such as Harleyford Manor, built in 1755. Here the hall accommodates a grand staircase which all but subordinates the function of the hall as a reception space, necessitating a tiny vestibule at the front entrance in order to receive visitors. Various types of hall staircase were popular: oval, circular and cantilevered, always top-lit. At Hagley Hall (1752) overlapping staircase circuits were required to circumnavigate successfully the two separate sets of assembly rooms in the east and west wings of the house.

The revival of the old Baronial Hall which was to become so striking a feature of much mid- and late Victorian country house architecture began in the second quarter of the 19th century. Based on medieval and Elizabethan models, these rooms were inspired by a romantic nostalgia for "old English hospitality" and the social and religious stability of a bygone age, and they provided a space for communal gathering where the lord and his tenants could once again come together for ceremonial meals and entertainments. The Gothic revivalist A. W. N. Pugin was a great admirer of settings of this kind and designed a number of Great Halls in buildings such as Scarisbrick (from 1837) all decorated in a suitably authentic medieval style. Another Gothic hall, built by Sir John Boileau at Ketteringham, Norfolk (1840) was described as "fit for the hospitalities of the chivalrous ages", and was used for dances for the gentry, dinners for the tenantry and an annual servants' dance. Elizabethan and Jacobean styles also proved popular in the first half of the century with notable examples at Charlecote Park (1848) and Knebworth (1840s); the latter had a staircase and banquet hall, both hung with armour and decorated with heraldic devices in the ancient tradition.

Increasingly, however, large Victorian halls were perceived as a useful additional space for the entertainment of family members and friends. They gradually took on the role of informal living or games rooms, containing large fireplaces, comfortable furniture such as armchairs, writing tables and sofas, musical instruments, and recreational facilities such as billiard tables and books. They were also a place in which guests could gather prior to meals, the descent from the first-floor rooms via a grand staircase acting as a showcase for the

ladies dressed in their finery. The apogee of the living-hall came in the last quarter of the century in the work of Renaissance revivalist architects such as Norman Shaw and the London firm of George & Peto whose great hall at Shiplake Court, Oxfordshire (1891), combines the scale and splendour of an old English prototype with the informality and comfort of a more modern dwelling. The fashion for such rooms was also fuelled by the Arts and Crafts interest in vernacular building types and they continued to appear well into the Edwardian period. However, the post-war economic strictures that hastened the demise of the country house lifestyle also helped put an end to the hall as a large, independent space, and in most modern homes it is simply a small vestibule providing access to a passageway or leading directly to the main rooms of the house.

Hardouin-Mansart, Jules 1646-1708

French architect

The posthumous reputation of Jules Hardouin-Mansart has suffered from the multiplicity of his activities, which were chiefly carried out in the service of Louis XIV, first as Premier Architecte du Roi and then as Surintendant des Bâtiments. His role was certainly as much civil servant and organiser as designer, but this should not blind us to his creative input in many spheres – not just interior decoration but also monumental architecture both religious and secular, engineering, town planning and garden design.

Hardouin-Mansart: Salon de l'Oeil-de-Bœuf, Versailles, 1684

The great-nephew of the leading mid-17th century architect François Mansart, in whose atelier he studied and whose surname he adopted, Hardouin-Mansart first rose to public notice at the Château de Clagny at Versailles (1673–79), designed for the king's mistress Madame de Montespan, after which he was quickly engaged to work in the main palace itself. The marble revetments of the first interiors there with which his name can be associated – the Escalier de la Reine (1680), her Salle des Gardes (1679–81) and the Salles de Venus and de Diane in the Grand Appartement (finished 1684) – follow the general effect of heavy magnificence evident elsewhere in the ceremonial interiors of the palace established under the artistic aegis of the Premier Peintre du Roi, Charles Le Brun.

It was around this time, however, in the design of the Galerie des Glaces (the Hall of Mirrors from 1678), a collaboration between Hardouin-Mansart and Le Brun, that we can see the emergence of the former's distinctive style in interiors. Here he put to good use his experience at Clagny, whose most celebrated internal feature was an elaborate gallery. In the Hall of Mirrors the emphasis is on purely architectural values, on simplicity and light. Le Vau's exterior envelope of the palace was extended and revised to allow taller, arched windows. Combined with the mirrors on the opposite wall, these flood the gallery with illumination to give the best possible viewing

conditions for Le Brun's cycle of paintings on the vault above. The general *ordonnance* of the interior is rich but restrained – the arcades of windows and recessed mirrors are enclosed within a modified Corinthian order, whose unbroken entablature and regular bay rhythm provide an undistracting framework to emphasise the great length of the room and the depictions of the king's victories on the ceiling.

Such ambitious interiors were necessarily collaborative efforts. Hardouin-Mansart was evidently happy to work with decorative painters – Le Brun and Mignard contributed to the decoration of his own house in Paris (1674). But the Bâtiments du Roi was a huge organisation, and he had many draughtsmen and other architects working under him. Many design decisions must have been taken by them rather than by Hardouin-Mansart, even if they all had to be passed by him before execution, and this must have been even more the case after he was made Surintendant des Bâtiments in 1699. It may be that he himself never executed his own drawings – certainly, none of the drawings which have survived are in his hand. This makes problematic the attribution of many of the interiors carried out at Versailles. On the basis of his study of the surviving drawings, Fiske Kimball effectively denied all attribution of interiors after 1684 to Hardouin-Mansart, identifying the designer with the particular draughtsman in each case, especially Lassurance and, from 1699, Pierre Le Pautre. We do

know that in the case of the Grand Trianon Hardouin-Mansart was away from Versailles in 1687 when the crucial decisions affecting the design of the exterior (at least) were taken, and that the building's appearance as we see it today is largely due to to his subordinate Robert de Cotte and to ideas emanating from the king himself (Jestaz, 1969).

Nevertheless, there are distinctive features common to much of the decorative work carried out under Hardouin-Mansart throughout his career which mean that it is possible to isolate the contribution he made to interior design independently of those in his employ. We can trace, for instance, an interest in the use of varied room shapes, first seen in the tiny hunting lodge, the Château du Val, that he designed for the king at Saint Germain-en-Laye in 1674, and which recurs in the Salon Ovale of the Petits Appartements du Roi (1692) and the Appartement d'Hiver at the Ménagerie (1698–99).

We can also distinguish, as in the Hall of Mirrors, a concern to introduce a properly architectural framework for interiors – not just for vestibules, but also the inner rooms of apartments. This is seen in the Appartement du Roi of 1684 (the bedchamber of which is now incorporated in the Salon de l'Oeil-de-Boeuf) and in the Petits Appartements of 1692. Often, interiors are enclosed and controlled by a full pilaster order with ornament concentrated in the frieze; even where this is not the case, key physical elements, such as doors and chimneypieces, are placed in a regular bay system determined by the height and spacing of window apertures.

On a more strictly decorative level we can also see a distinctive use of mirror glass, often filling to entablature height the chimney breast and bays answering to window openings. In a turn typical of the intricate taste of the last decades of the 17th century, and one which would be copied in many palace interiors elsewhere on the continent, these mirror bays could be used to set off curios and pieces of porcelain set on consoles – an idea proposed in 1692 for the Petite Galerie and carried out in the Cabinet du Conseil and at the Menagerie.

In the 1690s there developed a new, lighter approach to design. This was partly necessitated by the financial crises induced by the wars of the later part of Louis XIV's reign, a period when the silver furniture in the Grand Appartement was melted down and the Gobelins factory closed. However, it was also the reflection of a new concern for practicality and comfort, first seen in the dependencies of the main palace. In the Grand Trianon (from 1687) the interiors were not gilded and the panelling was painted plain white or grey; at the Ménagerie (1698–99) the king rejected designs with elaborate painted ceilings offered by Hardouin-Mansart for the apartment of the young Duchesse de Bourgogne, asking for simplicity and youthfulness, “de l'enfance répandue partout” (Hauteceur, 1948).

The desire for increased lightness was seen not only in simplified materials but also in general design, with a new emphasis on height and airiness. Heavy vaults and entablatures were reduced; on walls horizontal impost divisions were gradually eroded and *boiserie* mouldings refined – frame elements began to be extended by vegetal and arabesque carving to invade field areas, linking the full wall height in a continuous chain of motifs. The key element in this reformulation of the domestic interior was the new, low type of chimneypiece “à la Royale” (as engraved by Le Pautre) installed in the King's

Pavilion at Marly in 1699 and then in the remodelled Appartement du Roi at Versailles in 1701.

The Salon de l'Oeil-de-Boeuf as formed in this remodelling can be taken as representative of this last stage of Hardouin-Mansart's contribution to interior design. Elements such as the pilaster order with its entablature are retained from the 1680s, but the fireplace is low with a very tall overmantel mirror. Polychrome marbles have given way to a simpler gold and white colour scheme; lighting is facilitated by the oval window which lends the room its name (the same device had been used in the central salon at Marly); lastly, the vault is not painted but has a frieze of playing children which seems like a direct echo of the aging king's desire for a light and youthful note to be introduced into his surroundings.

Hardouin-Mansart's crowning architectural achievement, the Chapel at Versailles, is, as a religious building, outside the remit of this essay. In any case, the decorative work in its interior was completed after his sudden death in 1708. Nevertheless, it should be noted that the design as a whole, though monumental, again shows the search for greater lightness and simplicity characteristic of his decorative work in general.

It may be justified to speak of the effect of earlier work at Versailles being that of a “striking whole” which, in its details, “offers little in either painting, sculpture or architecture, which is of the first quality in itself” (Blunt, 1970). But this is surely not true of the interiors created under the Surintendance of Hardouin-Mansart: through the refinement of form and modelling they ushered in a new style – the Rococo – which would provide a formal and conceptual framework for much 18th-century decorative art.

DAVID CRELLIN

Biography

Born in Paris, 16 April 1646. Trained with his great-uncle, François Mansart, inheriting his large collection of plans and drawings. Worked independently from 1666; designed residence in new town of Versailles, 1669. In service of Louis XIV from 1673. Appointed Royal Architect and member of the Royal Academy, 1675; Premier Architecte du Roi, 1681; Surintendant des Bâtiments du Roi, 1699. Active on projects at Versailles and Trianon, from 1678 until the end of his career in the 1680s. Also worked on ecclesiastical buildings and town planning, such as the Place Vendôme in Paris, 1680–98. Died in Marly, 8 May 1708.

Heal's (Heal and Son Ltd.)

British furnishings manufacturers and retailers; established 1810

Heal's has long been synonymous with the promotion of fine craftsmanship and good taste in furniture and interior design. Under the direction of Sir Ambrose Heal (1872–1959), great-grandson of the firm's founder, who designed furniture for the company from 1896 until his retirement in 1953, the store pioneered many developments in retailing and manufacture. These included introducing the work of individual designers to the market, modernising shop design and layout, and manufacturing well-designed furniture, fabrics and lighting at affordable prices. In effect, Heal's helped to promote a taste for modern design among a new, younger and often intellectual

middle-class audience, while at the same time maintaining high aesthetic standards and commercial integrity.

Heal and Son was founded in 1810 by John Harris and his brother Ambrose Heal as a firm of feather dressers for mattress-making in Leicester Square, London. Heal moved the firm to Tottenham Court Road in 1818 to be near other furnishing businesses. John Harris Jr. took control in 1840 and expanded the shop, promoting the "Heal bed" and moving into bedroom furniture. He also exploited the benefits of innovation and advertising and in Christmas 1866, the company issued "invitations" in Charles Dickens's *Once a Year* for the public to come to Heal's to see furniture "as it would appear in their own rooms". The room-set has subsequently become the convention for furniture retailing display.

Ambrose Heal, Jr. joined the firm in 1893. Prior to this he had been educated at Marlborough and the Slade School, and then served an apprenticeship as a cabinet-maker with Messrs. Plucknett of Warwick from 1890 to 1893. Armed with this training he combined a visionary sense of design with a canny, commercial aptitude. His sincere, simple oak furniture was strongly influenced by the English Arts and Crafts movement and the timeless ideals of Cotswold craftsmen such as Ernest Gimson and Edward Barnsley. Unlike many of his contemporaries, however, Heal was not opposed to mechanisation and he was convinced of the value of machine tools to assist in the mass production of good design.

Heal's distinctively English style soon began to make its mark, helped by the firm's imaginative retailing techniques. In addition to producing catalogues, in 1898 the company commissioned Gleeson White, editor of the Arts and Crafts magazine *The Studio*, to write a brochure with illustrations by C.H.B. Quennell, which Heal's published under the title *A Note on Simplicity of Design in Furniture for Bedrooms with Special Reference to Some Recently Produced by Messrs. Heal and Son*. The booklet was widely praised for its usefulness and artistry. Heal's had embarked on its promotion of tasteful, modern design by allying itself with the aesthetic elite and by means of fine typography and illustration.

Ambrose Heal joined the Arts and Crafts Exhibition Society in 1906, exhibiting his range of fumed oak bedroom furniture which was named after English seaside towns such as St. Ives and Newlyn. Other pieces carried inlaid mottoes or bore the distinctive chequered black and white, inlaid border which became a feature of Heal's advertising for more than thirty years from 1902. A commission for the Hotel Standard at Norrköping, Sweden, helped promote the modern style, and established a long-standing and fruitful relationship between Heal's and Scandinavia. In 1900 examples of his furniture were shown at the Paris Exhibition. In the same year Ambrose Heal took over the directorship of advertising and introduced the new corporate logo of the four-poster bed. Heal was to commission the best illustrators, graphic designers and photographers in advertisements, catalogues and exhibition posters, and invitations.

In 1913 Ambrose Heal became chairman and, until his retirement in 1953, he exercised complete control over every aspect of the store. A landmark in shop architecture was heralded by the new building by Cecil Brewer at 195–196 Tottenham Court Road. Colonnaded and clad in Portland stone, the new building had windows from floor to ceiling on

the façade which let in large amounts of daylight and which gave shoppers and passers-by a good view of the inside of the shop. The signs on the exterior had crafted lettering by Percy J. Smith and painted ironwork plaques by Joseph Armitage advertising the skills of Bedding Makers, Carpet Dealers, Cabinet Makers and Upholsterers; the centrepiece announces the catchphrase "At the sign of the four-poster."

With his fellow-director, Hamilton Smith, and Cecil Brewer, Heal was a founder-member of the Design and Industries Association in 1915 which became the Council of Industrial Design, and was later re-formed as the Design Council. Heal's became a "showcase" for the association with members' work on sale transmitting its ideals of "truth to materials" and "fitness of purpose" to a broad middle-class audience.

The Mansard Gallery, on the top floor, was a highly innovative and influential means of raising the profile of progressive art and design. Significant exhibitions such as Sacheverell Sitwell's show of Picasso, Derain, Utrillo, Matisse and Modigliani in 1919 and exhibitions of the early chromium-plated metal furniture by Mies van der Rohe and Marcel Breuer and works by other continental designers and the British firm Isokon, were displayed in the gallery. Indeed, it was the stylish metal furniture and lighting, often designed by Heal and manufactured by the company, which proved a commercial success during the tough times of the 1930s. By means of innovation and imaginative retailing the store survived a difficult period.

Scandinavian furniture was brought to Britain by Heal's throughout the 1920s and the store also launched the sale of Orrefors glass and Finnish furniture, including pieces by Alvar Aalto. Ambrose Heal produced one-off, "signed edition" examples of his finely crafted, detailed classics. Cleverly promoted, economy lines from Heal's in the 1930s anticipate the functional Utility designs of the next decade. Ambrose Heal was knighted in 1933, thereby raising the profile and status of the design profession and their work in Britain at this period.

After World War II Heal's was a significant presence at the Britain Can Make It exhibition of 1946 at London's Victoria and Albert Museum, and at the Festival of Britain of 1951 which included plywood and moulded furniture by Christopher Heal, son of Ambrose, and several designs from their textiles department which was rapidly gaining a name in the field. Striking and novel fabrics in the optimistic and gay spirit of the late 1940s and 1950s by designers such as Lucienne Day, Helen Close, and Jane Edgar eventually evolved into the vivid, explosive textiles of the 1960s designed by Barbara Brown, Howard Carter and Peter Hall. Heal's textiles were highly successful in the 1960s and Heal Textil GmbH was also established in Stuttgart. Heal's continued to promote contemporary and international design throughout this period under the chairmanship of Anthony Heal. A further extension was opened in 1962 with 11,000 square feet of open-plan showroom space.

The arrival of imitators and rivals, such as Habitat, on the furniture retailing scene increasingly threatened Heal's share of the market in the 1970s and 1980s and in 1983 the store was purchased by Sir Terence Conran's Habitat / Mothercare Ltd., later to become Storehouse Plc. After Storehouse's demise in the troubled 1980s, a management buyout acquired ownership of the store. The current Heal's (still at Tottenham Court Road,

and with a new showroom in Fulham Road) aims to emphasise its core values of "style, quality and exclusivity" in the light of its impressive heritage.

SUSAN HOYAL

Selected Works

The Heal's archive, containing several hundred volumes of press-cuttings, daybooks, catalogues, correspondence, ledgers and other company records covering the period from the late 19th century to the late 20th century, is in the National Archive of Art and Design, Victoria and Albert Museum, London. Examples of Heal's furniture are in the Victoria and Albert Museum; numerous illustrations appear in the firm's catalogues, reprinted 1972.

Further Reading

An introduction to the company's work appears in their authorized history, Goodden 1984. For a more detailed and impartial analysis of Heal's between the wars see Benton 1978.

Health and Hygiene

All architecture is an index of attitudes towards health and hygiene as one of its basic functions is to shelter its users from physical and social danger. However, building interiors are particularly clear manifestations of the complex interaction between health and space. Such concerns have played an important role in shaping much progressive 20th-century domestic design, and since the 1920s Modernists such as Le Corbusier have championed an aesthetic of cleanliness in both the layout and planning of interiors and in the pared-down appearance of their decorations and furnishings. But an emphasis upon the need for more hygienic styles of living and a corresponding interest in healthier interiors pre-dates this period and has its origins in the sanitary and health reforms of the mid- and late 19th century.

Concerns about health peaked in the 1870s and 1880s following revelations about the direct connections between architectural design and illness. The "domestic sanitarians", as they were called in both England and North America, pointed

to the lack of ventilation, supposedly dangerous materials, and poor drainage to explain the spread of infection as the century progressed.

These concerns represented the second stage of the reformers' agenda. Sanitarians during the mid-century had concentrated their efforts on large-scale municipal improvements such as the sewers and the Embankment (in the case of London), and had focused on working-class housing. Edwin Chadwick's pivotal *Report on the Sanitary Condition of the Labouring Population of Great Britain* of 1842 had given credence to environmental explanations for health. It was not until after the postulation of the germ theory in the 1860s by Louis Pasteur that sanitarians pointed explicitly to the role of interior domestic space in disease transmission.

At the heart of the Victorian debate over health throughout the English-speaking world was the issue of ventilation, fired by a continued faith in the miasma theory of disease transmission even after the formulation of the germ theory. Tuberculosis and many other deadly diseases were thought to be spread through bad air; as a result, sanitarians prescribed well-ventilated rooms and corridors, insisting that both water closets and bedrooms have windows. The placing of sanitary facilities next to the exterior walls of houses was therefore also advised, as this allowed for windows and the thorough ventilation of drainage pipes.

In order to avoid drafts, architects also prescribed the use of the ventilating tube, a device which was first adopted by hospitals and schools. This tube or pipe was inserted directly into the exterior wall of a building and provided fresh air to interiors without the discomfort of drafts; the supply was regulated by a lid at the mouth of the pipe. The most popular model of ventilating tube was called "Tobin's tube".

The Victorian obsession with fresh air is perhaps most clearly illustrated by the history of hospital architecture. The ideas of Florence Nightingale, a dedicated miasmatist, led to the popularity of the "pavilion" plan hospital: a central administration building, flanked by long, narrow, open wards. This interior arrangement of alternating beds and windows was believed to reduce the transmission of disease among patients through the circulation of fresh air in the ward's interior.

The planning of middle-class houses in the 19th century also presupposed notions about health and hygiene, a factor reflected in the near obsessional interest in the growing specialisation of individual rooms. Most middle-class interiors, for example, included a special "sick-room" for use when family members were ill. Experts advised householders to furnish this room carefully, advocating simple textile and wallpaper patterns and quiet crockery that would not excite or disturb the feverish patient. Ordinary bedrooms were also considered particularly important to health as it was believed that people were most vulnerable to disease when they were asleep, and once again much attention was paid to the suitability of furnishings. Dust-retaining surfaces and materials were to be avoided and the elaborate bed-hangings and draperies fashionable in the second and third quarters of the 19th century were increasingly eschewed in favour of more simple treatments and beds made of polished oak, cast iron or brass. Brass and iron bedsteads had been in production since the 1830s but gained new popularity in the 1880s and 1890s in recognition of the fact that they did not harbour dust and could be easily cleaned.

Predictably, nurseries were also frequent targets for sanitarians' reforms and their recommendations included wipeable surfaces, such as oil-based paints and linoleum, for walls and floors, and plain painted furnishings. The important role played by bedrooms and nurseries in relation to health was underlined by publications such as Catherine Gladstone's *Healthy Nurseries and Bedrooms, including the Lying-in Room* of 1884.

However, it was not only the sleeping rooms, but the entire middle-class house that was affected by changing notions of health and hygiene, particularly with regard to decorations and building materials. Up until the 1860s, wallpapers frequently used pigments that were manufactured with arsenic which heightened the brightness of the colours, particularly in shades of bright green. Experts believed that these papers emitted toxic fumes that were responsible for a long list of common illnesses. Several well-publicized cases of childhood sickness and even death resulting, so it was believed, from arsenic poisoning led to the introduction of non-arsenical or arsenic-free wallpapers. The invention of washable, so-called "sanitary" wallpapers, in the 1870s, whose designs were printed with oil based pigments that were impervious to water, was another welcome improvement, but many sanitarians still disapproved of wallpapers. W.H. Corfield, for example, recommended using tiles in every room; Douglas Galton, an expert on hospital design, proposed walls of metal or cement. In 1875, Benjamin Ward Richardson advanced an entire city, "Hygeia", built on subways carrying fresh air. The interiors of Hygeia's houses consisted of a washable glazed brick.

The promotion of healthier living environments was also a major concern in the work of many architects and designers associated with the Arts and Crafts Movement, concerned as they were about the effects of industrialization and urbanization on the home. Queen Anne style architecture, for example, placed a premium on natural illumination and materials, features that were admired not only for their picturesque appearance but also for their encouragement of supposedly healthier lifestyles. The Movement's emphasis upon hand-crafted, vernacular interiors also marked a move away from the densely furnished and upholstered styles popular in the High Victorian period and fostered the use of simpler forms and finishes such as stained oak.

Poor drainage was considered the most dangerous of common building flaws and the most difficult to improve. This included everything from the inappropriate placement of water closets to the design of sewer traps. Sanitarians drew attention to the common mistakes in publications such as T. Pridgin Teale's *Dangers to Health: A Pictorial Guide to Sanitary Defects* of 1878. There is evidence that middle-class women were largely held responsible for the healthiness of their own homes; in America, this attitude was best expressed in Harriette M. Plunkett's *Women, Plumbers, and Doctors: or, Household Sanitation* of 1885.

In general, concerns about health affected every scale of decision-making about domestic architecture and its relation to the city. After about 1850, in fact, the row or terrace house was largely usurped in popularity by the detached, single-family house, especially in North America, fuelled by an attempt to escape the supposedly disease-ridden, crowded city, among other factors. Suburban development, resort architec-

ture, including both hotels and vacation houses, spas, athletic complexes, and the movement for public parks (especially in America) were also given a considerable boost by the assumption that nature and natural environments could function as spatial correctives to city living. Sleeping porches and plants in middle-class houses are among the material vestiges of this belief.

New suburban houses like those constructed in Bedford Park, London, in the 1870s were far less constrained by the size and shape of their sites than the row or terrace house of the central city. One of the healthier aspects of these houses was that the kitchens were located on the main floor, rather than in the basement. Advertising for Bedford Park and other Victorian suburbs emphasised the neighbourhood's healthy aspects and low death rates.

A major arena for the discussion of healthy interiors was the International Health Exhibition held in London in 1884 which included vast displays of heating and cooking equipment, clothing, machinery, food, ambulances, lighting, furniture and baths. A principal theme of this exhibition was the design of healthy houses and their contents, and among the most popular exhibits were the sectional models representing an "improved" and "ordinary" house which were open for public tours. One of the exhibition's organisers was the architect Robert Edis. Best known as the designer of the British pavilion at the World's Columbian Exposition in Chicago in 1893, Edis also had a substantial architectural practice in London and lectured and published widely on the subject of healthy furniture and decoration. In his most well-known book, *Decoration and Furniture of Town Houses* (1881), he insisted that the design of furnishings and wallpaper had a powerful impact on personal health. He detested commercially-produced furniture and warned against the dangers of deep carving and mouldings, the accumulation of useless ornaments, and the use of plush fabrics and upholstery as harbourers of dirt and dust. In their place he recommended fitted furniture with tops that reached to the ceiling to avoid dust traps, or furniture that stood on legs to facilitate dusting underneath, and loose floor-coverings that could be aired and beaten regularly. Edis's model room for the exhibition, displayed by the cabinet-makers Jackson and Graham, also exemplified his idea of treating rooms as a single architectural gesture rather than as a collection of isolated articles.

In some ways 20th-century interiors have generated less concern about health issues than the previous era, probably due to stricter municipal codes preventing the widespread transmission of foul air and sewage. By about 1900, floor plans of houses in England and North America were typically much more open, allowing the free movement of air between rooms and an increased transmission of light.

The 20th-century hospital, too, has been shaped by large-scale social reforms. Its plan, however, has become more closed. An arrangement of cellular rooms along a double-loaded corridor has replaced the open wards of the pavilion plan and medical technology and pharmaceuticals have largely displaced fresh air and sunlight as general treatments for disease. Nevertheless, light-coloured walls and easily washable materials are still used in hospitals.

Healthier living conditions were promised by the architects of the International Style during the 1920s, such as Le

Corbusier and Richard Neutra. In retrospect, however, their buildings offered few real innovations in terms of health and hygiene. The sleek, undecorated surfaces of Modernism, popularized after World War II in the ubiquitous ranch house, were showcases for high standards of housekeeping. In the name of health, a near mania for domestic appliances developed in the decades following World War II.

Our current debate over "sick building syndrome" – modern buildings that unintentionally generate illnesses – recalls in many ways the destructive powers attributed by Victorians to houses and cities. An "environmental" approach to health thus predates modern architecture by several generations, rather than emerging, as is often implied, from the energy crisis of the 1970s.

Heaton, Clement John 1861-1940

British stained glass, enamel, furniture and wall-coverings designer

The eldest son of Clement Heaton, the founder of the firm of stained glass manufacturers and interior decorators, Heaton, Butler and Bayne, Clement John Heaton was brought up at a time when that firm was producing progressive work and was carrying out important secular and ecclesiastical commissions, collaborating in particular with the architects, Alfred Waterhouse Richard Norman Shaw and Sir Arthur Blomfield.

Heaton joined his father's firm in 1880 becoming a partner after the latter's death in 1882. Friction over the company's commercial practices which, according to Heaton, were leading to a general lowering of standards in quality, led him to renounce his share in 1886. The terms of the break-up contract prevented Heaton from designing or making stained glass for a period of 15 years. This restriction left him with no other choice than to pursue experiments which he had already started with other techniques such as cloisonné enamel, mosaics, *opus sectile*, plaster and metalwork.

Heaton combined, to a high degree, practical scientific knowledge and technical resourcefulness with the creative talents of an artist. He invented both new processes and the machinery with which to carry them out, in the fields of cloisonné and embossed wall-covering in paper and cloth.

As an artist Heaton was inspired by the teaching of Ruskin and William Morris and was an early exponent of the ideals of the Arts and Crafts movement. He passionately believed in the essential unity of all arts and that the artist should be closely involved in the execution of his designs. Thus, in the field of stained glass he was opposed to the prevailing practice by which artists supplied cartoons without being involved in the

Heaton: staircase, Museum of Art, 1895-1906, Neuchâtel, showing cloisonné detail

execution of their design. Throughout his life Heaton remained craft-orientated, setting up his workshops in beautiful rural surroundings to achieve quality of life as well as work.

The first signs of artistic originality appear in the work Heaton carried out in his own technique of cloisonné. He eliminated firing and substituted enamels with coloured cements which were set between a web of metal walls and grew hard as they were drying. The result was a matt surface as opposed to the shiny surface of real enamels. The advantage of this hybrid process, which was patented in 1886, was its potential for the decoration of architecture. It could be applied on a large scale to walls as well as used to decorate smaller items in copper, such as vases, plaques, chargers and jardinières. By the early 1890s, Heaton had developed a distinctive style which exploited the expressive power of line surrounding flowing stylised patterns inspired by nature. The colours he used were soft and cool, predominantly delicate greens and blues. His work achieved recognition at the Arts and Crafts Exhibition Society exhibitions; at the Society's 1890 exhibition the Duke of Westminster acquired a vase in Heaton cloisonné. The same year Heaton was elected to the Art-Workers Guild. From 1892 Liberty started retailing Heaton cloisonné wares.

The frequent claims that Heaton was a close associate of the

Century Guild (1882–88) are, so far, unsupported by any contemporary document relating to the Guild. These statements might be founded on brief notes made some 50 years later in 1932 by Arthur Heygate Mackmurdo, one of which relates to a Heaton cloisonné piece he owned (now in the Colchester and Essex Museum). Heaton's major work in the field of decoration was the staircase and vestibule of the Museum of Art and History in Neuchâtel (1895–1906), which he undertook in collaboration with the painter Paul Robert. Heaton achieved artistic unity by integrating the three large allegorical paintings by Robert into the surrounding architectural framework by devising a rich, varied and innovative decorative scheme. The chased copper plaques, cloisonné decor, plaster work and embossed wallcovering which decorate the dadoes, walls, friezes, archways and coves exemplify Heaton's fascination with textures and the tactile quality of surfaces. The decoration of the Museum was published in the *Studio* (1899). In Great Britain and Ireland the surviving works in Heaton cloisonné on walls are a tympanum showing St. Peter Raising Tabitha, in Blomfield's extension of the church of St. Peter at Eaton Square, London, and two scenes showing Christ and Angels at the church of St. Michael and All Angels at Clane, near Dublin. Both date from 1892.

By the early years of the century Heaton's workshop was well established and very busy executing official and private commissions both in Switzerland and France. In 1904 another article about his work appeared in the *Studio*. Heaton had by then successfully exhibited in Paris where Bing also sold his work. In 1900 Heaton's workshop started to make furniture decorated with marquetry designs influenced by the Nabis. The influence of the latter also appeared in the three windows on the theme of the seasons in the Temple of St. Aubin (1903). In 1902 Heaton was free again to resume work in stained glass and over the following 13 years he executed more than 100 windows for Swiss churches and museums. The quality of the glass he used was a constant concern to him and he may have benefited from the research in this field carried out by his younger brother, Noel (1874–1955), a chemist. Noel had succeeded their father at the head of a separate company, Heaton and Co., which had been set up to supply materials for colouring glass. Among the most important windows of these years are those for the Collegiale of Neuchâtel (1905) and for the cathedral of Lausanne (1906).

Although Heaton received official commissions from the Swiss government, for example, four rooms in the Federal Palace (1901) were decorated with his embossed "linealis" wall-paper, it seems he was refused permission to carry out his own large mosaic designs for the National Museum in Zurich on the grounds that he was a foreigner, despite the fact that they had been accepted by the architect. Possible disappointment over this, coupled with the complete loss of his workshop in a disastrous fire in 1914, led him to emigrate to the United States, where he had already developed strong contacts with the architect Ralph Adams Cram.

From then on, Heaton devoted his life to stained glass. His work in America displayed a more conservative approach, dominated by the tradition of the Gothic revival. The windows of the church of the Blessed Sacrament in New York (1918) were the first major commission of his early US years. After his death, Heaton's workshop was carried on by his son Maurice

(1900–90) who was a highly original and experimental creator of glass works in his own right.

ANNE CERESOLE

Biography

Born in Watford, Hertfordshire, 21 April 1861, the son of Clement Heaton (1824–82), founder of the stained glass manufacturers and interior decorators, Heaton, Butler & Bayne. Attended Heatherley School of Fine Art, London, 1886; apprenticed to the stained glass manufacturers, Burlison and Grylls, 1886. Married 1) Lise Flore Favre, 1884 (died 1886): 1 son; 2) Rose Marie Junod, 1888: 5 daughters and 1 son, the stained glass manufacturer Maurice (1900–90). Joined his father's firm 1880; partner, 1882; resigned 1886. Established Heaton Cloisonné Mosaics Ltd., 1887. Settled in Neuchâtel, Switzerland, with a workshop at 10 rue de Collegiale, 1893; opened a workshop in Paris, 1903; moved the Neuchâtel workshop to Villaret near Comondrèche, 1908 (destroyed by fire, 1914). Emigrated to the United States where he was active as a stained glass designer; opened a workshop in Brooklyn, New York, 1914; established workshop at Valley Cottage, near Nyack, New York, 1917. Designed stained glass, 1880–86, and from 1902; active as a designer and manufacturer of cloisonné enamel, mosaics, embossed wallcoverings and plaster and metalwork from the mid-1880s; designed furniture, 1900–05. Took out patents for Heaton Cloisonné, ornamental mouldings and "linealis" embossed wallpaper, 1886. Exhibited: selected Arts and Crafts exhibitions 1888–1910; Paris Salon 1898–1900; Exposition Universelle, Paris, 1900. Appointed Master of the Art-Workers' Guild, 1890; resigned, 1898. Published articles on cloisonné enamel and mosaic and was an authority on French medieval stained glass. Died in New York, 1940; his workshop was taken over by his son Maurice.

Selected Works

Important archive collections relating to Heaton's work are in the Museum of Art and History, and the University of Neuchâtel Library, Switzerland, and in the Marquand Library of Art and Architecture, Princeton University, New Jersey, which has approximately 2000 items including drawings, watercolours, correspondence and lecture notes. Examples of Heaton's work are in the Staatliche Kunstgewerbemuseum, Berlin, the Victoria and Albert Museum, London, the Museum of Art and History, Neuchâtel, and the Musées des Arts Décoratifs, Paris.

Stained glass, cloisonné and decorations

- 1892 St. Peter's, Eaton Square, London (tympanum in cloisonné)
- 1892 St. Michael and All Angels, Clane, near Dublin (cloisonné decorations)
- 1895–1906 Museum of Art and History, Neuchâtel, Switzerland (decoration of the landing and staircase)
- 1897 & Palais Federal, Bern, Switzerland (four rooms including 1901 mosaic and "linealis" mural decoration)
- 1902 Temple of Cornaux, Switzerland (stained-glass windows)
- 1903 Temple of St. Aubin, Switzerland (stained-glass windows)
- 1905 Collegiale, Neuchâtel, Switzerland (stained-glass windows)
- 1907 St. Thomas's Hospital, London (cloisonné panels and stained glass)
- 1908 Museum of Art and History, Neuchâtel, Switzerland (3 windows in the hall)
- 1909 Museum of Art and History, Geneva, Switzerland (stained-glass window in the entrance hall)
- 1918–39 Numerous stained-glass windows for churches in USA

Hepplewhite, George died 1786

British cabinet-maker

The importance of George Hepplewhite is founded upon his pattern book *The Cabinet-Maker and Upholsterer's Guide; or, Repository of Designs for Every Article of Household Furniture, in the Newest and Most Approved Taste*. The title of the pattern book clearly shows the intention to illustrate the wide range of available designs; it was not intended to introduce new or avant-garde ideas. The work was also valuable to decorators and designers as it showed plans of rooms "shewing the proper distribution of furniture".

Hepplewhite died in 1786 so did not live to see the publication, which is now assumed to have been executed by his wife Alice. The first edition was published in 1788. This must have been well received, as a second edition came in 1789. The desire to be up to date resulted in a third edition being published in 1794. This included rectangular backed chair designs which replaced some of the more curvaceous and less fashionable ones from the previous editions.

With over 300 designs, the *Guide* was the first to show furniture in the Neo-Classical style and therefore perpetuated and popularised the Adam style. The influence of Adam can be

seen in the shapes of the back splats, and the use of urns, vases, petals, drapery, wheat ears, and rosettes.

The designs were intended to "unite elegance with utility", and to avoid "articles whose recommendation was mere novelty". Hepplewhite's other stated intention was to provide designs that would be of use to foreigners as well as "our own countrymen and artisans whose distance from the metropolis makes even an imperfect or superficial knowledge of its improvement acquired with much trouble and expense." It is therefore clear that the pattern book was not just for high-style use. Although the designs were not copies of Adam, demand for patterns of the Neo-Classical style must have been great, so this work was simply a codification of styles for the trade's use.

The most famous items were chairs which included the oval back, the wheel back, the heart and shield back chairs, all with either straight or tapered legs. In addition, Prince of Wales feather and wheat-ear motifs were his hallmark. Detailed recommendations included suggesting that shield back chairs ought to be upholstered as they were usually intended for drawing rooms.

Sofa designs were often made to appear en suite with chairs and the early Georgian idea of using joined chair backs for settees was revived. The combination of elegance and utility is seen in Hepplewhite's designs for sofas. They are particularly delicate but are more practical than Adam's due to the deeper seats.

The sideboard, with a central table flanked by urns, which was established by Adam, was continued by Hepplewhite, but he developed a new type-form when he integrated the table and pedestals into one piece. This was ideal for the smaller house, and practicality was again stressed with fitted wine storage and a heated section for plates. Hepplewhite considered that the sideboard was an important piece of furniture for the dining room, to the extent that he suggested the room was incomplete without one.

Elegance and utility again combine in Hepplewhite's designs for secretaire cabinets. Planned with a base like a chest of drawers and the front top drawer opening downwards to form a writing shelf, and with the upper section using glazed doors with bars echoing the classical-style motifs of the chairs, it has become a classic of its type.

Four-poster beds with slender posts continued the Chippendale tradition and were often supplied with decorative cornices. Few of these have survived, so most Hepplewhite beds are decorated with fabric valances.

It is important to remember that Hepplewhite was generally designing for the small private domestic interior, not for the large-scale country or town house that Adam often involved himself with. Hence his decoration was restrained and thus avoided too dramatic an effect. For friezes of tables, Hepplewhite suggested simple vertical fluting moving away from the Adam emphasis on classical detail. Table tops were simplified from the Adam by using only one motif with small festoons.

Hepplewhite did make some excursions towards the fanciful tastes of the period. The design for Rudd's Reflecting Dressing Table is an example of the taste for furniture specifically designed for a particular purpose, in this case to use a combination of moveable mirrors to enable the occupant of the

London, Published Sept. 1st 1787, by L. & J. Taylor, N^o 86 High Holborn.

Hepplewhite: designs for shield back chairs, a plate from *The Cabinet-Maker and Upholsterer's Guide*, 1794

table to see him or herself from most angles. A different taste was catered for by Hepplewhite's illustrated designs for library furniture, for example tables or bookcases, which might be ornamented with a vase or bust on the top.

The important role of pattern books in disseminating designs is shown by the *Guide's* particular influence. Faithful copying of Hepplewhite designs was carried out in North Germany, Italy, and Portugal while in Denmark it was ensured that the pattern books were available for the Royal Furniture Emporium. In Sweden the popular box-like form of sofa design was clearly influenced by Hepplewhite and in the new United States, the impact on the Federal style was often literal. The example of John Shaw and his interpretation of the Hepplewhite style in Annapolis demonstrates this well.

Although there had been some sporadic interest by collectors in the later 18th century furniture, it was not until the 1870s, when a general revival of 18th-century decoration occurred, that a Hepplewhite revival became inevitable. The response to the demand was on two levels. The high-class comprehensive manufacturing firms of the West End of London produced fairly faithful copies, and the East End trade

made less accurate but nonetheless passable imitations for a wide market. Hepplewhite's wider place in the market was confirmed by the re-issue of the *Guide* by Batsford in 1897. The elegance and compactness of many Hepplewhite designs has meant that they have been copied or adapted for the reproduction market ever since.

Herman Miller Inc.

American furniture and design company; established 1923

Herman Miller was founded as a traditional furniture company called Michigan Star Company in 1905, and was reorganized and renamed in 1923. Under the leadership of Dirk Jan DePree, it became a pioneer in contemporary design, standardization, marketing, and the development of office and industrial environments. It remained a closely-knit family business until 1970 when a second generation of DePrees made it a public company.

Like most of its Grand Rapids counterparts, the firm started out producing individual pieces of case furniture and sets of hand-crafted bedroom suites for such major outlets as Sears Roebuck & Co., in styles that were often indistinguishable from those of its competitors. Designs were derivative and based on assumptions of what the public would accept; they were also often conservative. The pieces were sold directly through department stores and wholesale distributors, where they were presented by manufacturers' representatives who might be selling a variety of products and with no particular knowledge about any individual item.

Herman Miller was able to turn the industry on its head and to even redesign the practice of interior design in the United States, not only because of the superior designers that were hired, but also through the firm's receptivity to innovation in all aspects of the business. Beginning in 1930, when DePree first hired Gilbert Rohde (1884–1944), a freelance designer committed to modern furniture, on a royalty rather than a fee

basis, the company began to change. Rohde challenged the prevailing notion that one needed large suites, and designed a four-piece modern bedroom set, without legs, and using plastics. At the same time, the larger pieces provided much-needed storage space for contemporary – and especially apartment – living. Within a few years, Rohde also got Miller to start using upholstery and metal as integral parts of their contemporary line. Also a pioneer of the concept of systems, Rohde introduced the idea of standardization that would allow hundreds of products to come out of a handful of components.

Changes in marketing and distribution soon followed, with seminars and training for sales staff and the establishment of the soon-to-be-copied external showroom. Leasing space in the Merchandise Mart in Chicago, Miller undertook the unusual practice of keeping the showroom open all year around, instead of only during the major quarterly shows, as was then customary. By presenting the products directly to architects and designers, the firm was able to both reach the public most receptive to its modern designs and to remove the steep commissions that had traditionally gone to the department store or distributor.

After Rohde's death in 1944, George Nelson (1908–1986) took the lead in designing many of the firm's products, and also in leading DePree towards a clear design philosophy. He instituted a greater degree of standardization, developed the concept of wall storage, and recommended volume production. While many of his individual designs and his technological innovations became classics, it is the wall storage system, with space for books, music components, etc., that has been his most lasting contribution in the eyes of the public. Recognizing the advantages of a leadership position, he convinced the company to issue its 1948 catalog with heretofore unidentified dimensions and fabrics listed, and to sell the catalog as a volume on contemporary design. The impact on the firm was incalculable: the first edition quickly sold out, and the public came to know both Herman Miller and the names of its designers in their own right.

As Nelson was unafraid of competition, he brought innovative designers such as Charles Eames, and artists like Isamu Noguchi to the attention of the firm, some as full-time staff and some working on contract or commission. Eames began a life-long but non-exclusive relationship with Miller in 1946. Eames and his wife Ray were pioneers in the use of plastics, resins, tubular steel, and other materials, inventing and designing whole new forms of seating furniture as they experimented both with materials and their potential. But in spite of the familiarity of designs such as the *Shell* chair, the *Chaise*, and the *Tandem Sling* seats, it is the fact that they have been used in such large numbers that has caused them to be so strongly imprinted on the contemporary mind. Entire universities and libraries are furnished with the Eames stacking shell chairs, airports throughout the world use the tandem sling seats, and their winged plywood chairs fill countless business and home offices. Working on the cutting edge of technology, Eames's designs helped the firm leap to the forefront of the institutional market, and the adaptation of their designs to various uses enabled Miller to respond to corporate America with unheard-of rapidity.

In the 1960s the inventor / designer Robert Propst took the

Herman Miller: items of furniture showing parabolic leg table by Isamu Noguchi, plywood screen by Charles Eames, and cabinet and clock by George Nelson

firm beyond its residential and large corporate bases, by introducing the concept of environmental design through the use of both individual components and specialized products. Work space configurations, created after long and intensive studies of psychology, office behavior, and the properties of materials, became known under such names as Action Office, and were created in the Ann Arbor based research center that Propst conceived. A second generation of this form of system development produced new environments for such specialized institutions as hospitals, where new modular, portable, and adjustable units can accommodate the traditional need of sanitation, storage and patient handling. Other Miller design solutions are so far from the concept of interior design that their story belongs more to the history of engineering and manufacturing.

Herter Brothers

American interior decorators and furniture manufacturers, 1859–1906

Herter Brothers, under the leadership of Gustave and Christian Herter, was one of the United States' leading 19th-century cabinet-making and interior decorating firms. An 1871 Herter Brothers bill of sale for a cabinet in the collection of the Currier Gallery of Art described its services as purveyors of "Rich & Plain Furniture, Curtains and Curtain Materials, Wood Mantels, Looking-glasses, Frames, Cornices & Clocks, Mosaics and Marqueterie, Architectural Decorations and fittings of Banks and Offices, Wall Decorations in Fresco, Wood, Tapestry, and Paper." Its most productive years were between 1858, when young Gustave Herter took over a firm originally established by Erastus Bulkley, and 1883, when Christian Herter died.

Numerous prominent investors, industrialists, and institutions commissioned work from Gustave and Christian Herter. They included Ruggles S. Morse (Portland, Maine, c.1860); Henry Probasco (Cincinnati, 1860–68); LeGrand Lockwood (Elm Park, Norwalk, Connecticut, c.1869–70); Darius Ogden Mills (Happy House, Millbrae, California 1869–70, 1880 and New York City, 1880); Milton S. Latham (Thurlow Lodge, Menlo Park, California, 1872–73); William H. Vanderbilt (New York City, 1869–71, 1878, 1879–82); the White House (1875); Mark Hopkins (San Francisco, 1875–80); Reed and Barton (Philadelphia, 1876); Tiffany & Co. (Paris, 1878); J. Pierpont Morgan (New York City, 1880–82); Jay Gould (New York City, 1882); and Arabella Worsham Huntington (New York City, 1881–84).

Julius Gustav [sic] Alexander Hagenlocher Herter (born Stuttgart, Kingdom of Württemberg, 14 May, 1830; died New York City, 29 November, 1898) and Christian Augustus Ludwig Herter (born Stuttgart, 8 January, 1839; died New York City, 2 November, 1883) were trained in Stuttgart as cabinet-makers. They joined the great wave of immigration from German principalities to the United States following the political and economic upheavals there in the late 1840s. Gustave Herter arrived in New York City in 1848 and gravitated almost immediately to New York's fashion center on lower Broadway in Manhattan. Soon thereafter he was working with Auguste Pottier (1823–96) in the firm Herter, Pottier & Co. (1851–53), and in a partnership with the established New York cabinet-maker Erastus Bulkley in the firm Bulkley & Herter (1851–58). In 1858, Herter took over Bulkley & Herter and named it after himself, Gustave Herter.

By 1859 his younger brother Christian was also in New York. In 1864 Christian joined Gustave's firm, which they then named Herter Brothers. The two brothers operated Herter Brothers in partnership until 1870, when Gustave retired and returned to Stuttgart to live until 1892, and Christian became the principal in the firm, a role he maintained until 1882 when ill-health compelled him also to retire. William Gilman Nichols (d. 1909), first in partnership with long-time Herter employee William Baumgarten (1845–1908), and then acting alone, continued the firm until 1906, but under his tenure it never enjoyed the success of its earlier years.

Herter Brothers' best known years coincide with a unique

Herter Brothers: Japanese parlour in the William H. Vanderbilt residence from Edward Strahan's *Mr. Vanderbilt's House and Collection*, vol. 1, 1883

moment in American history. First, Herter Brothers benefited from owners who were well trained in Württemberg under the lingering traditions of its rigorous German guild system, as, no doubt, were some of its employees. In New York, Herter workers' fine cabinet-making techniques were unfettered by traditional German shop practices. Herter Brothers furniture was made with uncompromising sensitivity to design, construction, and detail. It encompasses a full vocabulary of construction techniques, including panel and frame construction for case pieces, carving, marquetry, inlay, incising, turning, gilding, painting, and ebonizing.

Second, the firm thrived in an era of unparalleled American prosperity. Investors and industrialists eager to mark their social ascendancy commissioned Herter Brothers to decorate their residences in keeping with their aspirations or new status. The results, such as the William H. Vanderbilt residence at 640 Fifth Avenue, were uncompromisingly complete and luxurious.

Lastly, the firm thrived in a business climate that was being revolutionized by improved communication and transportation methods. Railroads, including the transcontinental railroad completed in 1869, which joined California to the East, made it possible for the Herters to execute commissions beyond New York City. The telegraph system and the Atlantic cable facilitated communication and enabled the firm to link European suppliers with American clients located from coast to coast. Faster ocean travel also facilitated both clients' and the firm's links with Europe.

Gustave and Christian Herter were synthesizers of European taste and fashion. They keenly followed European styles, adapting them to the preferences of their American clients. Whether reinterpreting an 1851 sideboard created by Parisian master Alexandre George Fourdinois for the 1853 New-York Crystal Palace Exhibition as Gustave Herter did, or looking at the work of James Lamb of Manchester and other English designers as Christian did in the 1870s, the brothers remained conversant with the latest styles, moving seemingly effortlessly through French Renaissance and Louis XIV styles, through Pompeian and neo-Grèc modes, to English reform and Anglo-Japanese designs. As the firm's designs evolved, so, too, did its furniture materials: walnut, maple, oak, mahogany, cherry (sometimes stained or painted to imply ebony or Japanese finishes), and rosewood, the most lavish, were used, often in combination on the same piece.

The firm's facility with different design vocabularies was due in large part to its continuing close ties to Europe, including a period in 1869 when Christian Herter lived in France. Herter Brothers bought ceiling and decorative wall panels in Paris from Pierre-Victor Galland for LeGrand Lockwood and William H. Vanderbilt, textiles in France for Vanderbilt and others, clocks and sculpture from Ferdinand Barbedienne's Paris foundry for Henry Probasco and Vanderbilt; and interior fittings from Guéret Frères for Milton S. Latham.

With few surviving Herter Brothers interiors (the Ruggles S. Morse house and Elm Park, the LeGrand Lockwood residence, are notable exceptions), the firm's reputation rests largely on its furniture, most notably its marquetry and mother-of-pearl designs made under Christian Herter's leadership in the late 1870s and early 1880s. In this furniture, the firm successfully combined traditional western forms with Anglo-Japanese ornament richly interpreted in contrasting abstract patterns of

dark and light marquetry. It was during these years that the firm also completed its most ambitious commission, the Vanderbilt residence located on Fifth Avenue between 51st and 52nd streets. Designed entirely by the firm, including the exterior, it was an elaborate progression of Pompeian, Renaissance, Moorish, Japanese, and Chinese styles carefully orchestrated in exotic woods, mother-of-pearl and minerals, and elaborately decorated surfaces and textiles. The Vanderbilt residence was Christian Herter's last great commission and the culmination of his career. It affirmed the integrity of Herter Brothers work, its originality, and the consummate craftsmanship for which the firm remains justly known.

Hicks, David 1929–

British designer of furnishings and interiors

David Hicks is arguably the best-known of all post-war British interior decorators and designers. Trained in fine art at the Central School of Arts and Crafts, he was one of a second generation of young designers whose interest in contemporary design heralded a move away from the faded elegance characteristic of the traditional “English Country House” style that had dominated up-market British interiors since the 1930s. Hicks’s trademarks were strong colours, crisp outlines, and bold, geometric carpet and fabric designs. But his interest in modern design was tempered by a fondness for antiques and, like the designer Michael Inchbald whose work Hicks greatly admired, his skill was in combining these two elements to create a distinctive and highly personal style. With offices in Britain, Australia, Belgium, France, Germany, Pakistan and Switzerland, his ideas have reached many parts of the globe and his work has been particularly influential in the United States. Moreover, his numerous books on decoration and design have helped to ensure that his ideas have reached a far wider audience than the wealthy and exclusive group that makes up his decorating clientele.

Hicks’s career as an interior designer began in 1954 when he redecorated his mother’s house in South Eaton Place, London, and photographs of his work were featured in the magazine *House and Garden*. These pictures attracted the

attention of Mrs. Rex Benson, the ex-wife of the publisher of Condé Nast. The two worked together on the design of her flat and this led to numerous small jobs, mainly re-upholstery work. In 1956, Hicks went into partnership with the antique dealer Tom Parr – Parr subsequently took over the running of the decorators Colefax and Fowler – and they opened their shop, Hicks and Parr, in Lowndes Street, Chelsea. In 1959 he opened his own shop, David Hicks Ltd., also in Lowndes Street, and continued both retailing and designing. But in 1963 he closed the Lowndes Street shop and worked from his house in St. Leonard’s Terrace. Sixteen years later he opened another shop at 101 Jermyn Street which featured four, frequently restyled, room settings, through which customers had to pass to reach the main body of the shop. The shop also doubled as the headquarters of Hicks’s international interior design business; he had numerous shops and associates in Europe and Asia dedicated to the dissemination of his design ideas. He designed everything from textiles, ceramic tiles and furniture to cufflinks, carrier bags and a church, but he was also concerned to employ other designers to widen the range of possibilities for his clients. However, unless they were associates, these designers worked under the company name. Hicks himself created interiors for such notable projects as the Q4 room on the liner *Queen Elizabeth II* and beauty salons for Helena Rubinstein.

In 1960 he married Lady Pamela Mountbatten and the home that he created for their early married life is a fine example of the eclectic Hicks style. The house, called Britwell Salome, in Oxfordshire, was built in 1728, and initially Hicks wanted to maintain the 18th-century quality of the rooms, keeping the furniture to a minimum and placing all the chairs against the walls. But gradually, the austerity and rigour of his plans were modified and increasingly he used the house to experiment with new interior effects before presenting them to clients. A description of the house appears in his book, *Living – with Taste*. The decoration of the library was particularly dramatic with matt black walls, white ceiling and woodwork, and books bound in shades of red and purple. The bathroom was also somewhat unconventional in appearance; the bath was placed centrally between two chairs and the overdoors were of *faux* granite. But the most important element of this room was the carpet; based on Persian mosaic designs, it was Hicks’s first geometric carpet.

These geometric designs were to become something of a Hicks trademark and were highly influential in the United States. Billy Baldwin (1903–83), the leading American post-war interior decorator, wrote that Hicks “had revolutionised the floors of the world with his small-patterned and striped carpeting”, and a beige, black and white carpet with another geometric design was used in Hicks’s collaboration with the American designer Mark Hampton for an East 89th Street apartment. This project also included white plastic chairs by the British designer Max Clendinning, a 19th century marble fireplace, and black walls lit by uplighters. It was simpler than the typical Hicks style, lacking the decorative details that he delighted in, but it was very “Sixties” in appearance and very much of its time.

Another of Hicks’s enthusiasms was for arrangements of personal collections of objects on small tables and sideboards. He called these arrangements “table scapes” and he created

Hicks: his own house, Villa Verde, Portugal, 1988

numerous small groups consisting of objects of virtue, shells, stones and other natural objects, or souvenirs and mementoes, ephemera and anything else that fitted into his theme or colour scheme. Many clients were happy to use Hicks's collections but he nevertheless tried to encourage them to devise their own creative arrangements and add them to the interior themselves.

Another example of Hicks's theatrical use of colour is a Chelsea dining room illustrated in Mary Gilliatt's *English Style* (1967). Hicks took as his inspiration the Durbar Hall in Jaipur; the walls of this room were painted orange with black

and white borders and the carpet was aubergine. The table was dressed in orange and white but the drinking glasses were blue. Lighting was provided by a spotlight in the centre of the ceiling and a jug that had been converted into a table lamp.

Hicks was evangelical about interior design, and in the 1970s he produced an inspirational series of books dealing with each room of the house in turn. The ideas presented in the books were based on his own work but he understood that many of his readers had limited incomes and the examples were modified accordingly. In 1970 he was presented with a

Design Council Award. He diversified into designing womenswear in 1982. He summarised his own view of his contribution to interior design thus: "My greatest contribution as an interior designer has been to show people how to use bold colour mixtures, how to use patterned carpets, how to light rooms and how to mix old with new" (*Living – with Taste*, p.72).

JANICE WEST

Biography

David Nightingale Hicks. Born in London, 25 March 1929. Trained at the Central School of Arts and Crafts, London, 1938–42. Served in the Royal Army Educational Corps, 1949–51. Married Lady Pamela Mountbatten, 1960; 3 children. Independent designer from 1953; founder-principal, with Tom Parr, of Hicks and Parr decorating firm, 1956–59, David Hicks Ltd. from 1959, and David Hicks Marketing Ltd. with branch offices in Switzerland, France, Belgium, Germany, Pakistan and Australia, from 1970; also active in New York. Designed textiles and carpets from 1960; clothing and fashion accessories for the Association of Japanese Manufacturers from 1977; womenswear collections from 1988. Published numerous books on decoration and design from the mid-1960s. Member and Master, Worshipful Company of Salters; Fellow, Royal Society of Arts, London. Received Design Council Award, London, 1970. Homes in London and Portugal.

Selected Works

Hicks's designs for public interiors include the original nightclub on the Queen Elizabeth II liner (1969), Raffles nightclub in Chelsea, beauty salons for Helena Rubinstein Ltd., and 10 Peter Evans Eating Houses. He has also designed numerous domestic interiors including several for his own family such as his mother's house in South Eaton Place, London (1954), his country house Britwell Salome, Oxfordshire (1960), and his villa in the South of France (late 1960s). Good illustrations of his interiors are featured in his books.

High-Tech

The term "High-Tech" has often been used to describe the Modernist style of architecture developed from the 1960s by British architects such as Norman Foster, Richard Rogers, Nicholas Grimshaw and Michael Hopkins. But it can also be applied to a style of interior design that flourished in the 1970s and 1980s and that found favour with fashion-conscious consumers on both sides of the Atlantic. This style celebrated the aesthetic of industrial production by introducing elements such as steel scaffolding, office furniture and factory flooring into the domestic interior. At its most extreme it represented a purist version of minimalist chic that contrasted sharply with both the historicism of late 20th century revivalist styles and the pluralism and irony of Postmodernism.

The emergence of High-Tech coincided with a growing disillusionment on the part of architects and designers with the achievements of the Modern Movement. But unlike those styles which turned to the past for inspiration, High-Tech retained a strong belief in the possibilities provided by the modern world and was aggressively optimistic about modern technology and the quality of modern design.

Within other spheres, notably industry, the term High-Tech denotes sophisticated production methods such as atomic energy, silicon chips and robotic control. Within design, however, the emphasis is frequently upon hand-crafting, and a High-Tech interior is often painstakingly constructed by craftsmen with the intention of looking machine-made. The essence of High-Tech is that it celebrates the way in which objects and interiors are made, and they frequently include exquisite, jewel-like joints and junctions, and materials such as shiny metal and glass, sometimes supplemented by brightly coloured studded rubber, that suggest transparency, lightness or modernity. The early adherents of High-Tech believed that architecture had been outstripped by other industries and felt compelled to try to bring the building industry up-to-date, often by importing techniques and methodologies from other spheres. Transport was an especially popular source of inspiration, and architects borrowed the imagery of rounded corners from the car industry, stressed-skin construction from the aerospace industry, and spars and tension cables from yacht-builders and shipyards.

Precursors of the High-Tech movement included work by Buckminster Fuller, Jean Prouvé, the California Case Study houses and, above all, the Charles Eames house built in Pacific Palisades, California, in 1949. The Eames house was assembled from mass-produced components, and its innovative interior was ordered by the open-web steel joists of the ceilings that formed a striking backdrop to the collection of modern furnishings and paintings displayed within. Twenty years elapsed before other designers developed the ideas embodied in this house.

In architecture, the generally accepted starting point of High-Tech is the Reliance Controls factory in Swindon designed by Team 4, a group of architects that included Norman Foster and Richard Rogers, and which was completed in 1967. The factory is executed in an unornamented minimalist style and represents a lightweight version of earlier buildings by Mies van der Rohe. Richard Rogers, working with Renzo Piano, went on to design the Georges Pompidou Centre

in Paris in 1977 which is one of the most well-known High-Tech buildings and which propelled the style into the big time. All the apparatus for servicing the building is boldly displayed on the exterior and the interior walls were designed to be moveable. The high-point of High-Tech architecture occurred with the completion in the mid-1980s of Rogers's Lloyd's insurance building in London, and Norman Foster's Hong Kong and Shanghai Bank in Hong Kong. Both buildings have modern, functional offices surrounding vast barrel-vaulted atria – a feature that has been widely imitated in other office buildings – with access to the different levels provided by futuristic, zig-zag tiers of escalators.

Interior designers were quick to pick up on elements of these architects' work, and soon began to employ imagery borrowed from industrial design. The case of the Czech-born designer, Eva Jiricna, is a notable example. She worked with Rogers on the fittings and furnishings of the restaurant for the Lloyd's building, and also designed a series of shops for the clothes designer, Joseph Ettedgui, that often featured stunning glass and metal staircases suspended from a complex web of stainless steel. Jiricna's work brought the aesthetic of High-Tech to the smart world of fashion retailing, and so successful were her Joseph interiors that other up-market retail chains, including Joan and David, and Vidal Sassoon, soon commissioned her to create High-Tech shops all over Europe and America. They came to represent the ultimate in high-fashion chic.

Although the High-Tech aesthetic was particularly well-suited to office and retail interiors, by the late 1970s elements of this style had also begun to appear within the domestic sphere. Initially, this trend was to be seen in architect-designed homes. Michael Hopkins's steel-framed house in Hampstead (1975), for example, contained an open-plan interior that featured exposed metal girders and living spaces demarcated by Venetian blinds instead of walls. The American architect, Peter de Bretteville's two family houses in Laurel Canyon, Los Angeles (1977) were similarly spare and were furnished with rectangular blocks of foam covered in yellow plastic, and Helmut Shulitz's Beverly Hills and Hollywood homes extend the High-Tech theme with interiors containing open wells and minimalist, boat-type, trim. But it was the publication in 1978 of Joan Kron and Suzanne Slesin's book, *High-Tech: The Industrial Style and Source Book for the Home*, that signified the formulation of a coherent, more commercial High-Tech domestic style. This book not only illustrated notable High-Tech interiors, – for instance the designer Joseph Paul D'Urso's minimalist New York apartment which included steel-mesh walls and hospital doors – and goods produced for industrial use placed in the home, it also provided the names and addresses of stockists where these products could be obtained. It included staircases in checker plate, laboratory beakers for the dining table, wire refrigerator shelving for bookcases, poultry cages as storage units, and car wheels as coffee tables, and the world of industrial products was ransacked for anything that might be used within the home. Another much-used source of inspiration was the office environment and as distinctions between the workplace and the home became less clear the functional efficiency embodied in the High-Tech style became increasingly popular among young professionals in the late 1970s and 1980s. The British retailer Habitat's range of

all-black furniture, launched in 1979, exemplified the mass-marketing of this trend.

High-Tech did much to counteract the nostalgia of much 1970s and 1980s design and it produced some of the century's most notable buildings, with interiors as impeccably crafted as the exteriors. But by the mid-1980s, the industrial character of the style had lost ground within avant-garde circles. Its minimalist strand, however, has endured. Indeed, the legacy of the High-Tech movement is a style that continues to use modern materials, such as polished metal and reflective glass, but in an increasingly simple and pared-down fashion. This has become an aesthetic of exclusion which strives to produce a look that, by virtue of its very sparseness, will appear classic and timeless. Whatever the merits of this development, it has been achieved at the expense of much of the energy and vitality that was originally associated with the High-Tech style.

Hildebrandt, Johann Lukas von

1668–1745

Austrian architect

Johann Lukas (or Lucas) von Hildebrandt is considered one of the finest architects and interior designers of the early 18th century Austrian Baroque period. Born in Genoa, he trained there and then in Rome under the Baroque architect, Carlo Fontana. Hildebrandt moved to Vienna, the capital city of the Austro-Hungarian Empire, in 1696. His career flourished, and, encouraged by his patrons, the architect assimilated the French Rococo style and through commissions all over the Empire became familiar with indigenous Austrian traditions in architecture. Hildebrandt's style is an amalgam of Italian, French, and Austrian sources which are brought together to produce original, often witty, and sophisticated designs for both churches and palaces.

The architect's aristocratic clients were at that time engaged

Hildebrandt: entrance hall, Upper Belvedere, Vienna, 1721–22

in building dwellings of two types: the garden palace and the city palace. Typically, a Viennese city palace sits on a narrow street between contiguous structures, has a long intricately decorated “show” façade, is entered via an ornamental stairway (Hildebrandt was one of the prime inventors of this form), and has major rooms for entertaining placed on the *piano nobile* (one storey above ground level).

The Daun-Kinsky Palace, 1713–16, is one of Hildebrandt’s most characteristic designs. The street façade carries tapered giant Ionic pilasters reaching from the *piano nobile* through the third storey. Richly sculptural window surrounds (in stucco), an entry-way flanked by atlantes, and a horizontal roofline that is punctuated by figural statuary complete the exuberant exterior. It is a direct prelude to the interiors which

likewise incorporate the architectural orders, sculpture and, in addition, painting to create the unified effect sought in Baroque decor.

Within the Daun-Kinsky Palace an octagonal foyer leads to an oval vaulted *sala terrana* overlooking one of the two interior courts that lie on the main axis between the palace's two long wings. To the left is the palace's most innovative interior, an ornamented stairhall (a stairway that fills an entire room). It leads to the main rooms, including the oval two-storeyed marble salon which lies above the *sala terrena*.

In the oblong stairhall, single flights of stairs lie directly above one another. They are flanked by windowed corridors on the court side. An Atlas figure, like those on the exterior, guards the entry to the stairs. These figures are a leitmotif of the Viennese Baroque, symbolically referential to the power of the inhabitant of the palace. The stairs proceed upward beneath a series of low cupolas stuccoed with delicate Rococo strapwork. The wall side of the stair is punctuated by niches filled with marble statues. The balustrade, opposite, is a series of carved stone scrolls. After one long flight of stairs, the space opens vertically through the rest of the building to a frescoed ceiling painted by the Italian master, Marcantonio Chiarini.

For his patron, Prince Eugene of Savoy, Hildebrandt designed the double garden palace, the Lower Belvedere (1713–16) and Upper Belvedere (1721–25). The garden palace type, used only seasonally, is a free-standing structure placed in a landscaped setting. The single storeyed Lower Belvedere, a residence, sits at the bottom of a hill. A French Baroque garden runs up the hill to the much larger multi-storeyed Upper Belvedere, designed to house the Prince's extensive art collection. Marble revetted Grand Salons, overlooking the garden, lie in the center of each of the palaces. There, in the Lower Belvedere, marble inset with figural bas-reliefs is used to face the fireplaces, overmantel, and door surrounds. Colorful illusionistic frescoes cover the rest of the walls and ceiling. Iconographically the narrative imagery alludes to Prince Eugene's military prowess or to his patronage of learning and the arts.

Other important rooms in the Lower Belvedere include a mirrored cabinet, which follows the French taste for delicately painted *boiseries* between walls of mirrors. The mirrors reflected the Prince's porcelain collection which was displayed on wall brackets. The coved ceiling is covered with delicate stuccoed putti cavorting among garlands of flowers and other Rococo ornamentation. The long marble gallery has stucco ornamentation over a slightly barrelled ceiling vault. One wall is divided into bays by tapered pilasters. Niches holding life-sized sculpture are set between them. The room's short ends are covered with large mirrors inset in marble frames that match the wainscoting. The other long wall holds large windows overlooking the garden.

The Upper Belvedere has two formal entries, on the garden side and on the court side. They incorporate, from the garden, a vestibule of atlantes beneath white stuccoed sail vaults. From the court, a *porte-cochère* gives access to a double staircase with marble putti holding bronze lanterns that leads directly to the Marble Salon. Overhead and on the walls a program of white Rococo stucco ornament continues. In the Marble Salon, salmon colored paired pilasters with gilded Corinthian capitals

line the space, octagonal in form, which rises two storeys to a frescoed vault.

Hildebrandt built several churches, the most important of which is the Dominican Church of St. Lawrence at Gabel in Bohemia (1699–1711). Its interior decor has been marred by fire, but the plan, a composite of centralizing and longitudinal elements has the tremendous energy of his many monumental stairhalls (e.g., at the Monastery of Gottweig, and the Weissenstein Palace). A pattern of separate vaulted spaces of different sizes are interconnected by torsion vaults.

Hildebrandt's mature style represents the synthesis of elements from Italian Baroque architecture, French Rococo, and imaginative Austrian indigenous art. His interiors are modulated from formal monumental Grand Salons, used for audiences and lavish entertainments, to more intimate delicately articulated cabinets reserved for private usage. His ingenious recourse to fine stucco work and fresco painting gave a lively and often light-hearted touch to interiors that reflect the cultivation of the arts in Viennese culture of the early 18th century.

Biography

Born in Genoa, 14 November 1668. Studied architecture in Genoa; continued his studies in Rome under Carlo Fontana c.1690, where he also trained as a military engineer. Married Francesca Johanna Perpetua Geist, 1706: 8 children. Commenced his architectural career in Italy, 1693–95; active as a military engineer in the service of Prince Eugene of Savoy in Piedmont, 1695–96. Moved to Vienna, 1696; employed as Councillor to the Court, 1698; appointed court architect, 1700. Ennobled by the Hapsburg Court, 1720. Named first court architect after the death of Fischer von Erlach (1656–1723). Died in Vienna, 16 November 1745.

Selected Works

A list of Hildebrandt's architectural commissions appears in Grimschitz 1959.

Interiors

- 1697–1715 Mansfeld-Fondi (later Schwarzenberg) Palace, Vienna (building and interiors including the chapel and rooms in the west wing; completed by J.B. and J.E. Fischer von Erlach)
- 1699–1711 Dominican Church of St. Lawrence, Gabel, Bohemia (building and interiors)
- 1701–17 Ráckeve Palace, Czepel, Hungary (building and interiors)
- 1702, City Palace of Prince Eugene of Savoy, Vienna
- 1708–09, (building by Fischer von Erlach;
- 1723–24 additions and interiors by Hildebrandt)
- 1705–06 Starhemberg-Schönburg Garden Palace, Vienna (designs for building and interiors; building completed by Franz Jänggle, 1711, interiors completed by others, 1721)
- 1705–11 Schönburg Garden Palace, Vienna (alterations, additions, interiors and garden)
- 1709–10 Archbishop's Residence, Salzburg (additions and interiors)
- 1711–15 Weissenstein Palace, Pommersfelden, Germany (building by Johann Dientzenhofer; stair pavilion and central pavilion including grotto, vestibule and Imperial Hall by Hildebrandt)
- 1712–25 Schönborn Country House, Göllersdorf (restoration, redecoration, garden, pavilions and orangerie)
- 1713–16 Daun-Kinsky Palace, Vienna (building and interiors)

- 1713–16 Lower Belvedere, Vienna (building and interiors including the marble salon, marble cabinet, frescoed salon and marble gallery)
- 1720–44 Prince-Bishop's Residence, Würzburg (building by Johann Balthasar Neumann; stair pavilion by Hildebrandt)
- 1721–25 Upper Belvedere, Vienna (building and interiors including the vestibule and stairhall and marble salon)
- 1721–27 Mirabell Palace, Salzburg (renovations, additions and interiors including the stairhall and marble hall)
- 1724–39 Monastery of Göttweig, Göttweig (east wing and stairhall)
- 1725–32 Schlosshof Palace, Marchfeld (additions and interiors and chapel)

Hill, Oliver 1887–1968

British architect and interior designer

Oliver Hill was once regarded as a lightweight figure because of his frequent changes of style, but his ability to find solutions appropriate to the requirements of each individual design commission without resort to dogma can now be seen as pragmatic and desirable rather than facile. He designed interiors for houses, apartments and public buildings which combined traditional attitudes to craftsmanship and materials with a Modern aesthetic, avoiding an uncompromisingly Functionalist approach, but including many design innovations. He also succeeded in bringing modern design to a wide public during the 1930s, particularly through his work on important Modernist exhibitions. And although Hill was part of the fashionable milieu of interior decorators of the 1920s and 1930s, his approach was fundamentally architectural and avoids any hint of superficiality.

Hill had little opportunity to execute much work before World War I, and his career only really began in the 1920s. This was also his most eclectic period, and his early houses are neo-Georgian (Sandhill, Aldeburgh, 1923–25) or neo-Vernacular (Cock Rock, Croyde, 1925–26, Knowle, Warwickshire 1923–29) in style. These buildings, together with the town houses and few commercial buildings of this period, show the influence of Edwin Lutyens, a family friend whose work Hill had admired from his schooldays. It was Lutyens who recommended that Hill gain experience working in a builder's yard, where he developed a love of textures and materials. The country house interiors are generally traditional and simply furnished, with picturesque details such as vast chimneypieces, and the occasional unusual and flamboyant touches in use of materials or colour (blue mosaic baths at Woodhouse Copse, Holmbury St. Mary, 1924–26 and Knowle). Such individual touches became increasingly dominant through the decade but from the very beginning showed a desire to specify details down to the cushions and curtains.

In Hill's London apartments and town houses, designed for wealthy clients with fashionable pretensions, there was the opportunity for extravagant show and experimentation. These commissions were seen as typifying the style satirised by Osbert Lancaster as Vogue Regency, but in fact they demonstrate considerable originality and a keen interest in Modernism. The Devonshire House apartment for Sir Albert Levy contained numerous Modernist features. It had a grey and black mirrored glass-walled entrance hall – albeit inset with leading suggesting classical arches and pilasters. The dining room, with the exception of the chairs, was formed entirely of different coloured marbles, with bands of colour providing the only ornament, uplit by onyx candelabra standing in each corner and with a vast slab of marble on a metal frame supporting a verdite table top. The music room was lined with laminated wood sheets of grey walnut from floor to ceiling, painted by George Sheringham with landscape scenes, delicately foreshadowing the style of the bolder Art Deco landscapes of Clarice Cliff pottery. The scenes included a pagoda to accompany a display of Levy's Oriental jade and crystal. Hill had always been interested in Chinese objects, particularly ceramics, and these were often incorporated into his interiors

as well as being a source for some of his favourite yellow and green colour schemes.

In the late 1920s the influence of Hollywood can perhaps be detected, in some of Hill's Spanish hacienda style houses, such as Marylands, Hurtwood, of 1928–29, as well as in his use of mirror cladding and his exotic bathrooms. These include the grey mirror-lined bathroom for Lady Mount Temple at Gayfere House, its glass shelves displaying blue glass objects and even the bath faced in strips of mirror, although lined with gold mosaic.

A visit to the 1930 Stockholm Exhibition opened Hill's eyes to the lightness and elegance of Scandinavian Modernism. His lack of preconceptions and unpolemical disposition allowed him to move increasingly towards a successful interpretation of this new style, designing furniture and commissioning work from artists and designers to provide additional modern furnishings and decoration. His first supposedly Modernist house, Joldwynds (1930–37) had light and plainly furnished interiors, with a curved glazed stair tower fitted with striped curtains by Marion Dorn and included an all-white dining room. However the furniture he designed found little favour with his clients, who complained about its large scale and concern for appearance rather than comfort, and the rooms appear rather bleak and box-like.

Landfall (1936–38) is a more genuinely Modernist house, glass fronted on the garden elevation, and with the hall between the dining room and large living room given a curved interior wall. The client, Mr. Ashton, who seems to have encouraged a radical approach, wanted a circular room. Folding doors allowed it to be opened up to give one large space. The uncluttered interior, with built-in fittings such as a drinks cupboard and radiogram, also had rugs by Marion Dorn and furnishings by Betty Joel and Alvar Aalto. In a letter to Ashton, Hill wrote that he liked to incorporate different coloured walls within a room, harmonizing them according to the light within, so he evidently did not often subscribe to an all-white interior. Here the colours seem to have included pinks and beiges. Some of Hill's wall finishes of this period were combed to give texture and he used the wonderfully named "Marb-L-Cote" on occasion.

In 1930 Hill set up the Rondo company to display and market modern decorative art. The company sponsored the Ariadne's Bath display at the 1930 Ideal Home Exhibition, a controversial exhibit designed by Hill. Although short-lived as a business venture, Rondo presumably opened up to Hill the possibilities of exhibition design and also helped his contacts with artists and designers. In 1933 Hill was responsible for the overall presentation of exhibits at the Exhibition of British Industrial Art in Relation to the Home. This popular exhibition, held at Dorland Hall and chiefly organised by Christopher Hussey, included Serge Chermayeff's Weekend House and the Wells Coates / Isokon Minimum Flat. Hill's own exhibits included a glass room, carried out by Pilkington's as a showpiece rather than a practical proposition, and the famous Stone Dining Room with stone walls incised with nudes by Eric Gill, and stone floor, table, sideboard and stools. This was later installed in Hill's own house in Cliveden Place, where the sitting room of 1938 also incorporated nudes by Gill, this time white line drawings on charcoal grey paper covering the chimney breast and protected by glass. An

Hill: bathroom, North House, London, 1929–33, with *Seaweed* ceiling paper designed by Edward Bawden

example of Hill's eclectic brand of Modernism, this room also featured a built-in fitting including a chaise-longue covered in dark green velvet and a radiogram, displays of Chinese porcelain, and a Chinese rug. The walls were panelled in pale cedar wood and the colour scheme was pale yellow and grey-blue.

The Ideal Home exhibition was followed in 1934 by the less successful Contemporary Industrial Art in the Home, also at Dorland Hall, at which Hill fell out with the Modernists over the luxurious nature of his exhibits, such as a snakeskin-covered piano.

For the 1937 Paris Exhibition Hill designed the British Pavilion and organised the displays representing modern British life, commissioning artists such as Eric Ravilious and Edward Bawden to provide backgrounds, as well as work by Raymond McGrath, Mary Adshead and others. The interior was modern and forward looking, anticipating both the Festival of Britain (1951), and, in its large photo-mural display, Alvar Aalto's Finnish Pavilion interior at the 1939 New York World's Fair.

In addition to his domestic work Hill also successfully worked on public buildings. The Midland Hotel of 1932–33 at Morecambe was one of the first public buildings in Britain in a Modern style, a "marine fantasia", according to *Country Life*, incorporating reliefs by Eric Gill, including one of Odysseus and Nausicaa, and a medallion depicting Triton; a spectacular three-storey concrete and blue and white metal spiral stair with blue rubber treads; murals of *Day and Night*,

by Eric Ravilious, occupying the whole of the circular wall of the café not occupied by window; shell-pink vitrolite-topped tables and steel-framed chairs in the café; and an entrance hall floored with sand-coloured stone and silver mosaic strips to resemble the sea rippling across a beach, with huge circular rugs by Marion Dorn continuing the wave theme, as do the colours of the blue and silver curtains.

Although his Modernist ideas were continued in designs for schools and an interesting public house built in 1939, Hill's commissions began to dry up from the late 1930s and those he did carry out after World War II show a reversion to Lutyenesque styles. His own country residences were restorations of older houses, first Valewood and then Daneway, where he spent his later years in an apparently joyous rural idyll. The interiors housed his own varied collections of objects and furnishings, put together in original ways, in conjunction with some startling colour schemes – including lime green, bright yellow and pink at Daneway. Hill's love of life was evident throughout all his work and does much to explain its fascinating variety.

DIANA HALE

Biography

Born in London, 15 June 1887. Educated at Uppingham; worked for 18 months in a builder's yard; trained with the architect William Flockhart, 1907–10, while also attending evening classes at the Architectural Association. Established his own architectural practice, 1910. Served in the London Scottish Regiment 1914–18. Resumed architectural practice from 1918; designed furniture and fittings from 1920s; established the Rondo company retailing modern decorative art, 1930; supervising architect for several national and international exhibitions during the mid-1930s. Associate, Royal Institute of British Architects, 1921; Fellow, 1923. Wrote extensively on architecture and design; published frequently in *Country Life*. Married Margaret Beverley, 1953. Appointed MBE (Member, Order of the British Empire), 1952. Died 29 April 1968.

Selected Works

A large collection of Hill's architectural drawings and designs are in the Drawings Collection, Royal Institute of British Architects, London; manuscript material is in the RIBA library.

Interiors

- 1926–30 Devonshire House, Piccadilly, London (interior decoration; music room paintings by George Sheringham): Sir Albert Levy
- 1928–29 Marylands, Hurtwood (building and interiors)
- 1929–33 Gayfere House, Westminster, London (building and interiors): Lord and Lady Mount Temple
- 1929–33 North House, Westminster, London (building and interiors): Robert Hudson M.P.
- 1930–37 Joldwynds, Holmbury St. Mary, Surrey (building and interiors including furniture and fittings): Lord Justice Wilfred Greene
- 1932–33 Midland Hotel, Morecambe, Lancashire (building and interiors; murals by Eric Ravilious, plaster reliefs by Eric Gill)
- 1932–33 213 King's Road, London (alterations and decorations): Mrs. Syrie Maugham
- 1933 British Industrial Art Exhibition, Dorland Hall, London (general design including the entrance hall, first gallery, stone dining room and glass room)
- 1936–38 Landfall, Poole, Dorset (building and interiors): Mr. Ashton

- 1937 British Pavilion, Exposition Internationale des Arts et Techniques Appliqués à la Vie Moderne, Paris (design of pavilion and display)

Hoffmann, Josef 1870–1956

Austrian architect and designer

Josef Hoffmann always considered himself an architect even though much of his work was interior design. He believed in the idea of design as an all-embracing discipline that encompassed everything from pattern and fashion design to interior design, architecture and landscape architecture. This is what for many years he taught at the Vienna Kunstgewerbeschule and what during sixty years he practised himself. He would use the same formal device for a small object, a piece of furniture, or a building, as with the undulating wall profile of his pavilion at the Paris Exposition Internationale des Arts Décoratifs (1925), which had its correspondence in furniture and metal coffeepots.

Exhibitions were of major importance in Hoffmann's oeuvre and contributed significantly to his eventual worldwide renown. At the outset of his career he designed pieces of furniture, rooms, and entire exhibition installations for the Vienna Secession, that highly successful association of avant-garde artists where he had close contacts with influential painters like Gustav Klimt, Carl Moll, and Kolo(man) Moser. From such fellow artists and interested visitors to the early Secession exhibitions Hoffmann received his first commissions, including the design of several houses and their interiors at the small housing estate of the Hohe Warte in a suburb of Vienna.

Hoffmann's earliest works such as the Apollo candle shop in Vienna and his designs for members of the Wittgenstein

Hoffmann: dining room, Palais Stoclet, Brussels, 1905–11; murals by Gustav Klimt

family (forestry offices and dwelling at Hohenberg, Lower Austria, and interiors at the Bergerhöhe nearby) show him under the spell of curvilinear Art Nouveau and the English Arts and Crafts movement. But around 1900 the earlier exuberance in form and colour is replaced by great restraint, a predominance of rectilinearity, and colour schemes of white and black. Three interiors from the year 1902 well represent this phase: the apartment for Max Biach, the rooms for Fritz Wärndorfer, and the rooms of the 14th exhibition of the Vienna Secession. For this exhibition Hoffmann created a barrel-vaulted main room flanked by upper galleries which through wide openings between piers permitted views down at Max Klinger's Beethoven sculpture in the centre of the main room. Gustav Klimt painted his Beethoven frieze for the left gallery, and Hoffmann himself contributed two striking, because completely abstract, *sopraporta* reliefs in cut plaster.

Fritz Wärndorfer, a young well-to-do industrialist who had met Hoffmann through the Secession, became not only his enthusiastic client and friend but also a business partner. In 1903, inspired by C.R. Ashbee's Guild of Handicraft, they, along with Kolo Moser, founded the Wiener Werkstätte. Moser withdrew from the enterprise in 1907 to concentrate on his

work as painter, but during the four years of his involvement he designed furniture and interiors in such close collaboration with Hoffmann that at times it is impossible to know who did a certain piece. Generally Hoffmann's designs are more restrained. During the almost three decades of the Wiener Werkstätte's existence its numerous artists and craftsmen created a wealth of works in all areas of the decorative arts; they were also responsible for furnishing and decorating many apartments and the small Fledermaus cabaret (1907), for mounting exhibitions, and, as long as Hoffmann was in charge of a separate architectural department, for providing designs of buildings. Three examples show Hoffmann and the early Wiener Werkstätte at their best: the Purkersdorf Sanatorium (1904), the Hochreith Hunting Lodge (1906), and the Palais Stoclet in Brussels (1905–11).

The building Hoffmann created at Purkersdorf had an exterior of dramatic simplicity, revolutionary for its date in the manner in which it presented a composition of cubic shapes without any historic reminiscences. The mostly white interiors, done jointly by Hoffmann and Moser, were characterised by spatial generosity and formal and coloristic reticence, with a reliance on the square as the predominant element. Hoffmann,

who usually designed on gridded paper, in Vienna jokingly became known as “Quadrat Hoffman” (Hoffmann of the little squares). At Hochreith, near Hohenberg, Lower Austria, Karl Wittgenstein, the industrial magnate and generous supporter of the Secession, had an existing lodge remodelled and furnished by Hoffmann who created a new entry and vestibule as well as a main room divided into two sections. The walls and ceiling of this carefully proportioned room were panelled in highly polished Maracaibo wood, and its furniture was strictly coordinated with the squarish grid of the wall panels which were framed by the same gilt mouldings as the furniture. Carl Otto Czeschka, Richard Luksch, and Kolo Moser contributed works of art to these rooms which heightened their sumptuousness and aesthetic appeal.

The same atmosphere of sophisticated richness that characterises the Hochreith rooms pervades the whole of the large Palais Stoclet, built, furnished, and appointed down to the last detail for two ideal clients, the extremely wealthy and distinguished art collector Adolphe Stoclet and his wife Suzanne. Here again, Hoffmann included works from a number of artists in his interiors. The Stoclet dining room, with marble walls, furniture in black macassar wood, large mosaic panels by Gustav Klimt, and a spatial and formal treatment to enhance these, became one of the most admired secular interiors of the 20th century. It forms the climax of an extremely artful sequence of rooms for entertaining on the ground floor, just as the master bedroom and the richly appointed large (6m by 5.8m) bathroom – marble-clad with black and malachite inlays and mosaic insets – are the high points on the upper floor. Never during the remainder of his career did Hoffmann surpass the achievement of the Stoclet ensemble, though he came close to it in the apartment for Moriz Gallia (1913) and in three large suburban houses at Vienna, the Ast House (1909–11), the Skywa / Primavesi House (1913–15), and the Knips House (1924–25). But by the time these houses and their interiors and furniture were carried out, Hoffmann’s style had changed noticeably.

This change can be observed by comparing the numerous exhibition installations Hoffmann designed over the years. They demonstrate a move away from the rigorous purism of the early years toward greater decorative richness and a personal reinterpretation of the classical vocabulary; this tendency is clearly recognisable at the Vienna Kunstschau (1908), at the Austrian Pavilion for the International Art Exhibition in Rome (1911), and even more strikingly at the Austrian Pavilion for the Cologne Werkbund exhibition (1914) which attracted much attention by the stylistic unity of its interiors, although except for the reception room, these were not done by Hoffmann himself, but by invited colleagues – often former pupils.

At the same time, however, Hoffmann proved his versatility by designs of folkloristic inspiration. For Otto Primavesi, a banker and, for a while, financial supporter of the Wiener Werkstätte, he designed a large country house at Kouty (Winkelsdorf) in the Praded (Altwater) mountains of Moravia (1913–14) using the local techniques of loghouse construction and thatching. The interiors too, through lively colors and a great deal of dynamic decoration by means of applied, painted wooden strips, often forming lozenges, echoed the strong forms and colours of Moravian folk-art which Hoffmann

admired and collected. In addition, these spiky forms may have owed something to the Expressionist movement in the visual arts, for Hoffmann always kept up with the latest artistic developments. Several exhibitions and rooms for private clients designed after the end of World War I show his awareness of Expressionism, and later of the various tendencies that contributed to the Modern Movement.

Hoffmann’s personal forte, however, remained the feeling for sophisticated decorative effects and an infallible taste in the selection of materials, patterns, and colors. This is as true for the Knips House – with its convincing employment of transparency and of contrast between plain surfaces and highly decorated elements – as for the boudoir Hoffmann designed for the Exhibition of Arts and Crafts in the Austrian Museum for Art and Industry (1923). The boudoir with its alluring, slightly orientalising sofa niche was later shown in New York and at the 1925 Paris exhibition for which Hoffmann also designed the remarkable Austrian Pavilion. The Pavilion’s top-lit main exhibition gallery had boundaries that were visually dissolved by the floor-to-ceiling glazing of showcases. On the inside these cases were covered in yellow, on the outside they displayed white flowery decorations on delicate black subdivisions. Hoffmann’s contribution to the Paris exhibition also included a tea-room and a smoking room as well as a gallery for Austrian printing and publishing firms. For the successful completion of the Paris installation Hoffmann relied on the collaboration of Oswald Haerdtl and Max Fellerer, two senior assistants, who, like so many other former students or employees such as Robert Mallet-Stevens, later became major architects and interior designers in their own right.

Hoffmann’s last major interior designs once more were done in connection with exhibitions. Not only was he in charge of the general arrangement of the 1930 Werkbund exhibition in Vienna, he also designed for it the great central hall – covered by a pleated, top-lit velum with inclined sides – and its flanking display corridors as well as the adjoining café with a large terrace. The idea of a display corridor was taken up again in the Arts and Crafts Gallery of the exhibition Austria in London at Dorland Hall in 1934. In the same year Hoffmann designed the Austrian Pavilion for the Biennale in Venice, with Robert Kramreiter as partner for the execution. Sixty years after its opening, this recently restored building, small yet monumental, dignified yet graceful, with proportions derived from the square, still fulfills its function perfectly. The sequence of its contrasting yet interacting spaces, from the open travertine-framed portal and vestibule, down a few steps into the galleries on either side, and finally into the open sculpture court, in its simplicity is as sophisticated and effectual as Hoffmann’s great exhibition pavilions of earlier years.

To the end of his life Hoffmann never ceased designing. He left a vast legacy of objects, pieces of furniture, and drawings that, like his surviving buildings, bear testimony to the strength of his talent and the fecundity of his creative imagination. He was held in high professional regard internationally as indicated by his numerous foreign honors and decorations, and the fact that he contributed the entry on modern interior decoration to the 14th edition (1929) of the *Encyclopaedia Britannica*. While the important role he played in Austria is

generally realised, his extensive impact abroad remains to be fully appreciated.

Biography

Josef Franz Maria Hoffmann. Born in Pirnitz, Moravia (now Brtnice, Czech Republic), 15 December 1870. Studied architecture under Carl von Hasenauer and Otto Wagner at the Academy of Art, Vienna, 1892–95; awarded the Rome Prize, 1895. Married 1) Anna Hladik, 1903; 2) Karla Schmatz, 1925; 1 son. Worked with Joseph Maria Olbrich in the studio of Otto Wagner, Vienna, 1896–97; in private practice in Vienna, 1898–1956. Professor, Vienna School of Applied Arts, 1899–1936; founder-member, the Secession Group, 1897; founder (with Koloman Moser and Fritz Wärndorfer) of the Wiener Werkstätte, 1903; director (with Gustav Klimt) of the Kunstschau, Vienna, 1908–09; co-founder and director, Austrian Werkbund, Vienna, 1910; director Künstlerwerkstätte, Vienna, 1943–56. Awarded honorary doctorates from the Technische Hochschule in Dresden, Berlin and Vienna. Received the Légion d'Honneur, Paris, 1926. Died in Vienna, 8 May 1956.

Selected Works

A catalogue raisonné of Hoffmann's work, including designs for furniture and interiors as well as architectural projects, appears in Sekler 1985. Examples of Hoffmann's architectural drawings and decorative designs are held by the Academy of Fine Arts, Vienna and by the Austrian Museum of Applied Art, Vienna. Archival material can be found in the Wiener Werkstätte Archive, Austrian Museum for Applied Art, which also holds the best collection of Hoffmann's furniture, and in the Archive of the Association of Austrian Artists, Secession, Vienna.

Interiors

- 1898 Ver Sacrum Salon, Secession Exhibition, Vienna (decoration and furniture)
- 1899 Apollo candle shop, Vienna (entrance and furnishings)
- 1899 Bergerhöhe, near Hohenberg, Lower Austria (remodelling of the interiors): Paul Wittgenstein
- 1899–1902 Exhibition designs for the Secession, Vienna (decoration and furniture)
- 1901–03 Kolo Moser House, Hohe Warte, Vienna (building and interiors) Carl Moll House, Hohe Warte, Vienna (building and interiors) Hugo Henneberg House, Hohe Warte, Vienna (building and interiors)
- 1902 Max Biach Apartment, Vienna (remodelling and furnishings)
- 1902 Wärndorfer House, Vienna (interiors including smoking room, nursery, gallery, dining room; with Koloman Moser): Fritz Wärndorfer
- 1903–11 Ast House, Hohe Warte, Vienna (building and interiors): Edouard Ast
- 1904 Purkersdorf Sanatorium, Purkersdorf (building, interiors and furnishings; with Koloman Moser)
- 1905–11 Palais Stoclet, Brussels (building and interiors): Adolphe Stoclet
- 1906 Hochreith Hunting Lodge, near Hohenberg, Lower Austria (building, interiors; with Koloman Moser): Karl Wittgenstein
- 1907 "Die Fledermaus" Cabaret, Vienna (remodelling of interior and furnishings)
- 1909–11 Ast House, Vienna (building, interiors and furnishings)
- 1913–15 Skywa / Primavesi House, Heitzing, Vienna (building, interiors and furnishings): Josefine Skywa and Robert Primavesi
- 1913–14 Primavesi House, Winkelsdorf, Moravia (building, interiors and furnishings): Robert Primavesi

- 1914 Austrian Pavilion, Deutsche Werkbund Exhibition, Cologne (building and selected interiors)
- 1915–16 Knips Apartment interiors, Vienna (interiors including anteroom, living room, smoking room, boudoir, dressing room, bedrooms, studies): Sonja Knips
- 1923–24 Ast House, Velden on the Wörthersee (building and interiors): Edouard Ast
- 1924–24 Knips House, Dobling, Vienna (building, interiors and furnishings): Sonja Knips
- 1925 Austrian Pavilion, Exposition des Art Décoratifs, Paris (building and interiors; with Oswald Haerdtl and Max Fellerer)
- 1928–29 Graben Café, Vienna (remodelling of interiors and furniture)
- 1930 Austrian Section, International Exhibition, Stockholm (interiors)
- 1934 Austrian Pavilion, Biennale, Venice (building and interiors; with Robert Kramreiter)

Holland, Henry 1745–1806

British architect

Although Henry Holland's practice was not the largest of his day, he created a decorative style that proved extremely influential, appealing to aristocratic patrons, the leaders of taste, and appropriate in smaller country houses and town dwellings. Like his chief patron, George Prince of Wales (later King George IV), Holland, brought up in the tradition of the francophile Sir William Chambers, was an enthusiast for the classicising French late 18th century Louis Seize style. This he assimilated with Greek and Roman models found in the latest works of scholarship or obtained from drawings he himself commissioned. He did not visit France until 1785, though he closely studied French design in such publications as those of Blondel, Patte, Dumont, Gondoin and Neufforge. Italy he never visited, but made use of G.B. Piranesi's etchings; and in 1794 commissioned Charles Heathcote Tatham to collect antique and contemporary specimens and make drawings. For Greece, there were Desgodetz's or Stuart and Revett's studies of the antiquities of Athens and Ionia.

Holland established his reputation by his work on a gentlemen's club, Brooks's, in St. James's Street, London, a favourite resort of the Whig aristocracy; the Prince of Wales became a member in 1783. Holland had bought the site, so when Brooks took it up for his club in 1776, he was naturally given the commission. His work here was strongly marked by contemporary French classicism. The refined decoration, best exhibited in the Great Subscription Room, more restrained than that employed by Holland's leading English contemporaries Robert Adam or James Wyatt, is characterised by its lowness of relief. Even the great Venetian window is treated as a Roman arch in low relief with semi-columns, and circular features above the side windows (which he repeated externally on the greenhouse at Woburn); the ceiling is a simple but impressive segmental vault divided into nine panels by narrow guilloche bands. The chimneypiece of white marble is likewise treated simply, surmounted by a large glass framed in three panels and a carved relief above, a device Holland particularly adopted. The mahogany doors, luxurious but restrained, have reeded panels, ebony handles with mother-of-pearl stars, and painted elliptical overdoors.

At Berrington Hall, Herefordshire (1778–83), Holland combined ideas from Piranesi's Roman engravings with Greek details culled from recent publications of source material. The hall retains its delicate but complex colouring, with grey-white and pale blue walls; a great arch, its soffit covered in terracotta and biscuit, creates directional ambiguity; the stairs rise in another direction, under a lantern dome, the pink ceiling panelled in pale blue, the mouldings gilded, as at Brooks's. More elaborate in its decoration than most of Holland's work, Berrington anticipates the splendours of Carlton House, yet it is more restrained than the late work of Adam or Paine. Duck-egg blue or green, terracotta and flesh shades, bistre, and gilding are extensively employed, together with columns in *scagliola*. The decoration culminates in the drawing room with its richly ornamented ceiling – cupids and sea-horses in high relief between gaily painted medallions by Biagio Rebecca – and marble chimneypiece with a sculptured frieze supported by

herms. A similar combination of relief (foliage swags) and painting obtains in the dining room ceiling. The boudoir is an early essay in Louis Seize, the segmental ceiling's panels distinguished by colour rather than relief, but with an exedra in James Wyatt's manner, marked off by lapis-lazuli *scagliola* columns and a scalloped concave ceiling. Holland's mastery of contemporary English fashions is further exhibited in the library, a completely integrated design similar to Robert Adam's Nostell Priory.

The francophile character of Holland's work at Brooks's Club proved highly congenial to the Prince of Wales. Endowed in 1783 with his grandmother's somewhat ramshackle Carlton House, Pall Mall, London, the Prince rapidly invited Holland to enlarge and reorganise it. For this major undertaking, where there was already a French clerk of works, Guillaume Gaubert, Holland engaged a French assistant, J.P.T. Tre COURT, French craftsmen, including Alexandre-Louis Delabrière, T.H. Pernotin and other decorative painters (from whom John Crace learned the art), and Jean Prusserot (wood-carver), and the *marchand-mercier* Dominique Daguerre. Several of them had lately been employed at the Pavillon de Bagatelle, Paris, for the Comte d'Artois, Louis XVI's brother. In 1785 Holland himself went to Paris.

The 20th-century historian Peter Thornton regards Holland's Carlton House as "an almost pure expression of Parisian taste of the 1780s". Holland's contemporary, Horace Walpole, however, while appreciating that Holland's ornament was new to England, saw it rather as a delicate synthesis of modern French and antique, having "more freedom and variety than Greek ornaments, and though probably borrowed from the Hôtel de Condé, and other new palaces, not one that is not rather classic than French ... How sick one shall be, after this chaste palace, of Mr. Adam's gingerbread and sippets of embroidery" (to Lady Ossory, 17 September 1785). Holland's decorations, however, were soon superseded by new princely preferences, and few illustrations of them are known. Only the hall and staircase survived largely unchanged, the hall recalling that at Berrington, but of a more Roman character, *scagliola* columns supporting entablatures and friezes flung across segmental arches on each side, flanked on the longer sides by niches containing sculptures *à l'antique*. Holland's Chinese drawing room (perhaps inspired by Chinoiserie at Bagatelle), known from the illustrations in Sheraton's *Cabinet-Maker and Upholsterer's Drawing Book* (1791) and furnishings now in Buckingham Palace, is not essentially different from his Neo-Classical work, marked by flat panelling, rectilinear furniture with rounded ends, and exquisite detail of ornamental carving.

The Prince also acquired a seaside villa or "Marine Pavilion" at Brighton, which Holland greatly enlarged in 1787, and further in 1795 and 1800–03. Contemporary descriptions (for Holland's work has been lost in subsequent alterations) again stress the French character of the work, which included paintings by Rebecca in the grand saloon. In his last period, Holland reworked much of the interior in Chinoiserie, the painting carried out by John Crace (1754–1819) – employed at Carlton House – and his son Frederick (1779–1859).

For the Prince's brother, the Duke of York, Holland enlarged James Paine's York (previously Featherstonhaugh, subsequently Melbourne, and then Dover) House, Whitehall, in 1787–90, creating in the courtyard an exquisite circular

Holland: boudoir, Berrington Hall, Herefordshire, 1778-83

vestibule in which Doric *scagliola* columns support a dome, a plan probably derived from J.-F. Neufforge, and remodelling several of the rooms. At the same period Holland was working for Lord Spencer, at Spencer House, London, and also at Althorp, Northamptonshire, both conspicuous aristocratic rendezvous. Similarly, he was much employed on houses belonging to the Duke of Bedford, most extensively at Woburn, where overdoors by George Garrard in naturalistic high relief were introduced in the suite of South rooms, and much built-in furniture to Holland's designs, including the library bookcases with convex features at the corners and characteristic mirrors with relief panels above; while a Chinese dairy (1787) was again decorated by Crace.

The most perfect statement of Holland's Neo-Classicism, however, is to be found in a smaller country house, Southill, which he reconstructed in 1796–1803, for the brewer and radical Whig politician, Samuel Whitbread: the most complete fusion of the English Palladian tradition with antique (Greek and Roman) and contemporary French elements. Neo-Classical ornament is combined with a naturalism (seen notably in the reliefs and paintings of the over-doors) inspired by contemporary science. The ceilings exhibit restraint, ornamented with severely rectangular panels of rich mouldings in low relief: except in the dressing room or boudoir (where Delabrière was employed to paint decorations), ceiling-painting is eschewed. The chimneypieces generally have Holland's characteristic rather low form and restrained sculptured enrichments, often based on specially commissioned drawings from the antique taken in Rome, varying in richness to correspond with the character of the room. Above them hang his usual gilt-framed mirrors surmounted by panels in relief. His furniture is characterised by the same rectangularity as his ceiling decorations, but he employed concave or convex ends, or colonnettes at the corners of cabinets, commodes or bookcases, after a Louis Seize fashion. Some Southill designs are contained in his sketchbooks in the library of the Royal Institute of British Architects, London.

This melding of French classicism with elements of Greek and Roman antiquity created a masculine, restrained style of great elegance and purity, characterised by precision and refinement: an aristocratic manner, employing an innovative vocabulary governed by traditional syntax. His furniture, much of which was built-in, formed an extension to the architectural decoration of his rooms, dependent upon framed panels distinguished by good proportions rather than elaborate mouldings or ormolu enrichments. Although he did not, as has sometimes been stated, introduce *scagliola* in England, he used it extensively (employing the Italian craftsman Dom Bartoli), and his work at Carlton House saw the revival of marbling, and painting in imitation of bronze. His Chinoiserie, although governed by the same fundamental rules as his Neo-Classical work, exhibited an alternative vocabulary that was widely taken up.

Biography

Born in London, 20 July 1745, the son of the master builder Henry Holland (1712–85). Married Bridget Brown, daughter of the land-

scape gardener Lancelot "Capability" Brown (1716–83), 1773: 5 children. Trained in his father's building yard in Fulham. Practised as an architect from 1770 and worked with Capability Brown from 1771; assisted by the architect John Soane and the designer Charles Tatham, 1772–78. Appointed clerk of works at the Royal Mews, Charing Cross, 1775; surveyor to Bridewell and Bethlehem Hospitals; employed as architect by the Prince of Wales, 1782–93. Visited Paris, 1785. Founder-member of the Architects' Club; Fellow of the Royal Society of Antiquaries. Died in London, 17 June 1806.

Selected Works

Two sketchbooks relating to Holland's work at Carlton House, and a volume of drawings (mainly of interior decoration) are in the Drawings Collection of the Royal Institute of British Architects, London; another sketchbook is in Sir John Soane's Museum, London; records of the accounts for Holland's work at Althorp are in the archive, Althorp, Northamptonshire. The most comprehensive list of his architectural commissions is in Colvin 1995.

Interiors

- 1776–78 Brooks's Club, St. James's, London (building and interiors, including the Great Subscription Room): Lord Brooks
- 1778–83 Berrington Hall, Herefordshire (building and interiors): Thomas Harley MP
- 1783–96 Carlton House, London (remodelling and interiors): Prince Regent
- 1785–92 Spencer House, London (internal alterations, including red dining room and small drawing room): 2nd Earl Spencer
- 1786–87, 1795, 1800–03 Marine Pavilion, Brighton (alterations and interiors): Prince Regent
- 1787–90 Featherstonhaugh (now Dover) House, Whitehall, London (additions and interiors): Duke of York
- 1787–89 Althorp, Northamptonshire (recased house and remodelled interiors, including gallery, library, yellow drawing room, south drawing room, blue boudoir, and some furniture): 2nd Earl Spencer
- 1787–1802 Woburn Abbey, Bedfordshire (additions, alterations and interiors, including library, eating room, sculpture gallery and Chinese dairy): 5th Duke of Bedford
- 1796–1803 Southill House, Bedfordshire (remodelling and interiors, including new drawing room, dining room, entrance hall, sitting room, boudoir, and library, and some furniture): Samuel Whitbread

Holland and Sons

British cabinet-makers, upholsterers and decorators,
c.1815–1947

Holland and Sons was one of the largest and most celebrated furnishing firms in Britain in the 19th century. Renowned for the scope and variety of its work, the company initially favoured Neo-Classical and Gothic styles and later 18th century revivalist and Renaissance styles. 237 volumes containing detailed records of the firm's commissions, accounts and designs are preserved in the National Archive of Art and Design, London, and represent a unique record of both the workings of a successful Victorian cabinet-maker and of wealthy Victorian taste.

The history of Holland and Sons dates back to at least 1815 when Stephen Taprell and William Holland are first mentioned as in business together at 25 Great Pulteney Street, London, under the name of Taprell and Holland “cabinet makers etc.” While little is known of Taprell, documents in the Victoria and Albert Museum point to a family connection between William Holland and the famous Regency architect, Henry Holland. Taprell and Holland's growing reputation led to its first major commission to furnish the Athenaeum, London, in 1824. The club was furnished throughout from designs by Decimus Burton in the Grecian Style; much of the furniture remains in place today. The firm went on to work for a number of other gentlemen's clubs. The most notable was the Reform Club, the first club to be built and decorated throughout in an Italian Renaissance manner, but they also provided furniture for the Army and Navy Club on Piccadilly, and other London venues including the Oxford and Cambridge, and the Carlton clubs.

Following several changes of address, the firm's name was changed to Holland and Sons in 1843, and was amended again to William Holland and Sons in 1846. In 1850 they were listed in trade directories as occupying premises at 19 Marylebone Street with workshops in Lower Belgrave Street, Pimlico, and in 1852 the main offices moved to 23 Mount Street where it is possible that Holland's took over the cabinet-makers, Thomas Dowbiggin and Co. whose past commissions had included the state throne for Queen Victoria's coronation (1837). Holland's themselves received the Royal Warrant early in Victoria's reign and supplied furniture to Balmoral, Buckingham Palace and Windsor Castle at various dates throughout the 19th century. Between 1840 and 1845 the company was involved in the commission to furnish the Queen's new house at Osborne on

the Isle of Wight; much of their work has since been dispersed to other royal residences such as Sandringham.

During the 1840s, Holland's and the rival firm, Gillows, were awarded the tender to manufacture furnishings and upholstery for the New Palace of Westminster to the revived Gothic designs of A.W.N. Pugin. This contract led to almost 300 further Government commissions, and Holland's retained and were still using Pugin's designs well into the 1870s.

By 1850 the company had grown to a considerable size and the census for the following year records James Holland, upholsterer and son of William, as employing 350 men. In the mid 1850s the firm's workshops were described by Matthew Digby Wyatt as being “among the best mounted in London, exhibiting all recent improvements as to process of manufacture ... introducing machinery to a large extent ... with workshops so excellent and so well arranged with every known appliance for good and cheap production.” The company was also strongly committed to improving standards of furniture design but declared a great drawback to be the “great want of designers, draughtsmen and modellers, in fact, of all directors of art. The very few who can assist demand are paid such excessive rates that their services are dispensed with except on important occasions”. Nevertheless, Holland's themselves employed top British and Continental designers throughout the 19th century including Henry Whitaker in the 1840s, J.K. Collings in the 1850s, and G.E. Street in the 1860s, and the firm's success is partly attributable to the quality of their designs.

Holland's also scored several notable successes at various International Exhibitions. In 1851, the company received a prize for their massively proportioned chimneypiece and bookcase in the Italian Renaissance style. In 1855, they exhibited a neo-Renaissance ebony cabinet and stand designed by the celebrated German architect and theorist, Gottfried Semper which was purchased five years later by the South Kensington Museum. And in 1867, they received another prize for their *Pericles* sideboard, exhibited at the Paris Exposition Universelle and designed by Bruce Talbert whom they employed from 1866 until his death in 1881. Although the sideboard's name – derived from the quotations from Shakespeare that decorate the superstructure – had classical allusions, its form was in the reformed Gothic style and its decoration included liberal use of features such as marquetry quatrefoils and trefoils, and crockets and finials. Made of polished oak and fruitwood, it was praised by the *Art Journal* as “certainly the most distinguished among competing Gothic works”. It was purchased by the Empress of France and, much more recently, it fetched a record price for a piece of Victorian furniture when it was sold at Christie's in January 1986.

However, royal commissions and exhibition pieces are hardly representative of the everyday business conducted by the firm which also undertook much more mundane and even minor tasks ranging from the furnishing of provincial houses to delivering two dozen buttons to a home in Oxford Square. Like many successful upholsterers they offered an enormous variety of services and the company's day books provide a fascinating record of jobs that included supplying display cases to the British Museum, erecting and decorating the stands for Edward VII's coronation procession, and even mending the lock on A.A. Milne's basement door. They also served as

auctioneers, sanitary engineers, surveyors, a furniture repository and house and estate agents, and in their capacity as undertakers the firm arranged the funerals of the Duke of Wellington, the Duchess of Kent, Princess Sophia and Lord Leighton.

During the last decades of the 19th century, Holland's was able to meet the challenge of a public who demanded increasingly varied and novel styles by drawing upon past commissions for inspiration. Their catalogue of 1896 states: "Having secured the assistance of well-known artists we are at all times ready to submit designs for rooms of special objects and we have also the advantage of numerous old models, collected during many years." The plates show furniture and interiors in the Louis XIV and 18th-century styles, Moorish styles which were "in much request for the Smoking Room where comfort is looked for", and the Italian Renaissance style which "peculiarly lends itself to interior architecture, and is seen nowhere to better advantage than in the Hall or Dining Room". Nevertheless, the numbers of workmen employed by Holland's steadily declined. The Pimlico workshops were acquired by Morris and Co. in 1887, and by 1900 little cabinet-making, with the exception of special items, was undertaken by the firm.

Selected Works

The Holland and Sons archive containing over 200 ledgers, day books and account books, the majority covering the period 1824–1942, is in the National Archive of Art and Design, Victoria and Albert Museum, London. Examples of Holland and Sons furniture are in the Victoria and Albert Museum, and remain *in situ* at Buckingham Palace, the Reform Club, and the Palace of Westminster, London, and Osborne, Isle of Wight.

Interiors

Holland and Sons worked on interiors at several London clubs, including the Athenaeum (1824), the Reform, the Army and Navy, Oxford and Cambridge, and the Carlton, during the mid-19th century. Also provided furniture for several royal houses, including Windsor Castle, Osborne House, and Buckingham Palace. The company was a major contractor for H. M. Works in the late 19th century and worked on the Palace of Westminster and other government buildings, and supplied furniture and decorations for the Great Western Railway and the Royal Academy, London.

Further Reading

There is no published monograph on Holland and Sons, but an unpublished typescript of their history by the furniture historian Edward T. Joy is in the collection of his widow, Mrs. Edward Joy. Information relating to the early history of the firm can be found in Jervis 1970.

Hollein, Hans 1934–

Austrian architect, designer and artist

Trained as an architect in Vienna and the United States in the 1950s, Hans Hollein has endeavored to express his personal commentary on society through all the visual arts, from jewelry design to performance art. In the 1960s, Hollein produced collages criticizing the modern urban landscape; shortly after, he combined his individuality, his understanding of the human psyche, of modern materials, and high craftsmanship together in memorable structures devoted to the new consumer society. His designs were informed and influenced by his Viennese predecessors, the turn-of-the-century progressive architect / designers Adolf Loos, Otto Wagner, and Josef Hoffmann. Hollein formally paid tribute to them in his 1986 reconstructive installations for the exhibition *Vienna: Dream and Reality, 1870–1930*, held at the Künstlerhaus, Vienna.

Hollein's rebellion against Modernism has placed him with the Postmodernists, who critiqued modern architecture and design through their anti-rational architecture and furnishings for an intellectual, cynical contemporary society. The meanings of Hollein's work, however, reside both in and beyond the surface – beyond the mere referencing of historical sources in anti-rational ways – characterized by creative, successful spatial solutions and novel uses of materials. Hollein's best interiors bring together diverse historical and psychological sources to create interiors that are both innovative and manipulative.

With his statement "Architecture is not the satisfaction of the needs of the mediocre, is not an environment for the petty happiness of the masses ... architecture is an affair of the elite" (Collins and Papadakis, 1989), Hollein has conveyed his understanding of his audience. Hollein's architectural commissions have concentrated in the areas of shopping, art, travel, and commerce, with structures serving a culturally sophisticated, financially secure audience; these situations have allowed him to develop interiors for those who can appreciate "aesthetically upgraded post-industrial objects" (Collins and Papadakis, 1989). He has explored the layers of meaning these structures and their interior spaces can hold.

Among his most striking architectural accomplishments in terms of original and evocative spatial arrangements are the municipal museum at Mönchengladbach, Germany and the Museum of Modern Art in Frankfurt. Hollein has also been very successful in dealing with existing spaces for new uses, with striking results: in the sensitive but expressive remodeling

Hollein: Schullin Jewelry Shop II, Vienna, 1981–82

of a medieval town hall in Perchtoldsdorf that preserved centuries-old frescoes of former mayors, and in the architectural carving of a breathtaking central atrium for a Madrid bank from the interior of three 19th-century apartment buildings, while still preserving the original façade. Hollein secured, with successes such as these, the prestigious contemporary architecture award, the Pritzker Architecture Prize, in 1985.

Where these architectural projects employ blatant deception (placing new contents inside old packaging) Hollein's well-known interiors, on the other hand, are subtle manipulations of the expectations of customers through his uses of real and *faux* materials. Hollein does this through his designs for interiors that evoke a surface response as well as a deeper intellectual or psychological one. In Hollein's Austrian Travel Agency in Vienna of 1976–79, he employs objects such as palm trees, an Indian pavilion, airplane wings and ocean liner railings that have an immediate association for the traveler. However, Hollein elevates these pedestrian travel-poster images by creating them in expensive, uncharacteristic materials such as marble, bronze, and mahogany. As with many of his interiors, he juxtaposes exquisite materials with industrial ones, such as

aluminum, Formica, acrylic, and frosted glass. On another level, Hollein quotes the vision of one of his Viennese architectural forefathers: his Doric column, representing travel in Greece and Rome, is a reference to Adolf Loos's unrealized columnar design for the Chicago Tribune building competition in 1922, though Hollein altered the original reference through his transformation of the column at the halfway point into a column of steel. As well, his metallic palm trees refer to the fantastic palms created by John Nash for the Royal Pavilion at Brighton. In his discussion of this interior, the architect Mark Mack has made the distinction between Hollein and his fellow Postmodernists: "Hollein offers a functional and metaphoric spatial organization with a semantic content, in direct contrast to the stage-set architecture of Charles Moore and Michael Graves" (Mack, 1979).

In his 1982 design for the interiors of the Schullin Jewelry Shop in Vienna (his second shop for Schullin), Hollein catered again to the culturally and financially elite, and filled the interior with provocative, luxurious elements appropriate to the shop's function. Hollein recognized the customer's base instinct to be drawn towards the glittery objects at the entrance to the

shop, whose door (with square perforations in perspective, à la Josef Hoffmann) was surmounted by a curved, blade-like object on two supports that resembled a primitive weapon. These ignited consumer desires were fanned in the front room of the shop, where a sharply diagonal floor and matching light poles of exotic woods reinforced the customer's yearning and led him or her into the back room, where a ghostly, ethereal, almost holy atmosphere pervaded through the use of white marble flooring, gold leaf, and soft light, a reassurance to the consumer of the validity of his or her possible purchase. Hollein manipulated his audience once again by mixing the precious with the base (such as *faux* marble and chrome-plating), and layered meaning through his deceptively simple selection of motifs and materials, subtly producing what can only be called a ritualistic interior.

Hollein has been able to infuse the objects he has designed most directly with semantic importance; the purchasers of these objects are expected to recognize and appreciate their significance beyond the mere decorative or utilitarian. In 1981, Hollein was one of eleven internationally-recognized architect / designers who were asked to design a tea and coffee *piazza* to be produced by Officina Alessi (the avant-garde section of Alessi) on a suggestion from Alessandro Mendini. The use of an architectural term for a functional object reinforces the Postmodern sense of architectural spatial arrangement applied to familiar forms. Hollein chose an aircraft carrier to define the placement of his tea service components, a continuing exploration of a theme he developed in an absurdist photomontage from 1964 called *An aircraft carrier in the Austrian wheat-fields*, that gave added meaning to his service beyond the historical or architectural references of his fellow *piazza* designers.

Hollein's furniture designs have blended the serious with the whimsical, and, like his interiors, looked to the art-historical past. In 1981 he was one of eight non-Italians to produce designs for the inaugural Postmodern Memphis collection; Hollein's *Schwarzenberg* side table, the most symmetrical, controlled piece of the group, featured a stepped top and luxurious blond wood, recalling the Biedermeier furniture designs made for the Austrian elite of the early 19th century. His *Marilyn* sofa for Poltronova, produced in 1984/85, is layered with references: to Marilyn Monroe (inspiration for the original lip-shaped red Marilyn sofa of the 1960s, designed by Studio 65 for Gufram), to Art Deco blond wood furniture used in the era of the screen goddess, and to Biedermeier.

Hollein's early European commissions and the Austrian predecessors he has quoted have allowed him to develop his particularly exquisite brand of Postmodernism. Hollein has escaped the American trap Mack describes as "the rapid turnover of businesses in America [which] promotes rapidly built spaces and material hollowness" (Mack 1979). In a description of one of his interiors Hollein seems to sum up his entire creative philosophy: "I think you should have complexity in simple things, and simplicity in complex things. And if you can overlay both, I think that is the ideal." (*Architectural Record*, September 1994, p. 84).

Biography

Born in Vienna, 30 March 1934. Studied at the Department of Civil Engineering, Bundesgewerbeschule, Vienna, 1949–53, then at the School of Architecture, Academy of Fine Arts, Vienna, 1953–56, Dip.Arch.; studied in the US: architecture and planning at the Illinois Institute of Technology, Chicago, 1958–59; M.Arch., College of Environmental Design, University of California, Berkeley, 1960. Worked in various architectural offices in the US, Sweden and Germany; in private practice in Vienna, since 1964; consultant designer to various corporations in Austria, France, Italy, Japan and the US, including Herman Miller, Alessi, Memphis, Baleri, Knoll International, and Yamagiwa, since 1966. Professor of Architecture, Academy of Fine Arts, Düsseldorf, Germany, since 1967; head of the School and Institute of Design, since 1976, and leader of the master class in architecture, since 1979, at the Academy of Applied Arts, Vienna; Visiting Professor, Yale University, New Haven, Connecticut, since 1979. Author of numerous articles on design and architecture and editor of *Bau* magazine, Vienna, 1965–70. Received numerous prizes and awards including the Grand Austrian State Award, 1983, German Architecture Award, 1984, and Pritzker Prize, 1985. Honorary Fellow, American Institute of Architects, 1981; Member, Royal Swedish Academy of Fine Arts, Austrian Chamber of Architects, German Chamber of Architects, League of German Architects.

Selected Works

Examples of Hollein's designs and drawings are in the Museum of Modern Art, Vienna, and the Avery Library, Columbia University, New York. Examples of his furniture and furnishings are in the Art Institute, Chicago, the Victoria and Albert Museum, London, the Minneapolis Institute of Arts, the Museum of Modern Art, New York, and the Centre Georges Pompidou, Paris.

- 1989 Fukuda Motors Building, Tokyo (building and interiors)

Hollein's design work includes stage designs and numerous designs for furniture, jewellery, lamps, sunglasses, lighting and household appliances. His furniture includes the *Roto-desk* made by Herman Miller (1966), the *Mitzi* and *Marilyn* sofas made by Poltronova (1981 and 1985), the *Vanity* dressing table for Möbel Industrie Design (1981), the *Schwarzenberg* table produced by Memphis (1981), and the *Sigmund Freud* divan (1984). Hollein also designed

the *Aircraft Carrier* tea-service for Alessi (1980–81), and has produced jewellery designs for A.E. Köchert and Cleto Munari, and tableware designs for Swid Powell.

Hope, Thomas 1769–1831

British architect, collector and connoisseur

Born in Amsterdam into a wealthy and cultivated family of bankers, Thomas Hope travelled extensively on the Continent before settling permanently in England in 1795 where he established himself as a patron of the arts. Hope's Grand Tour of 1787–95 took in Turkey, Egypt, Syria, Greece, Spain, Portugal, France, and Germany. Later excursions included Egypt (1797), Athens (1799), Naples (1802), Rome (1803) and Italy (1815). An amateur architect, collector and connoisseur, Hope was also a competent draughtsman producing an eclectic and highly personal range of designs for interiors and furnishings that incorporated Greek, Roman and Egyptian elements, with an admixture of Indian or Turkish features. While his practical involvement with architecture and interiors was confined to his own two houses, his publications and engravings were influential and well-known. He also played an important role in efforts to improve standards of design by education and actively promoted Greek Revival principles and an archaeologically correct version of the Neo-Classical taste.

Hope had begun to assemble his important collection of antique and modern art, purchasing sculptures from Flaxman and a number of antique statues and Egyptian pieces, during his Grand Tour. In 1799 he bought a house built by Robert Adam in Duchess Street, Portland Place in which to display these pieces, adding items purchased from Sir William Hamilton's second collection of vases in 1801. Hope made substantial alterations to this property c.1800 and, fired by a desire to influence and educate contemporary taste, he opened it to the public, issuing tickets of admission to Royal Academy members in 1804. In 1819 he added a Picture Gallery of his own design in which he displayed the collection of Dutch and Flemish pictures belonging to his brother Henry Philip Hope. This room was decorated in an advanced Neo-Classical style and contained complementary classical-style furniture also designed by its owner.

In 1807 Hope published *Household Furniture and Interior Decoration Executed from Designs by Thomas Hope* which contained general views of the principal interiors of the Duchess Street house as well as measured drawings of individual pieces of furniture. The spare, linear style of the engravings in this book was clearly indebted to the drawings of Flaxman and was paralleled by the style of illustrations in Percier and Fontaine's *Recueil* (1801). Hope's intention was that his book should serve as a sourcebook for designers and craftsmen. It did not include a plan of the house, but a contemporary sketch-plan was drawn up by the antiquary Francis Douce sometime before 1819. This plan is now in the Bodleian Library and offers additional information relating to Hope's ideas and the Duchess Street decorative schemes.

Apart from the Picture Gallery the interiors included a Sculpture Gallery, a second Picture Gallery suggestive of a Greek temple, and Indian and Egyptian rooms. According to Richard Westmacott's *British Galleries of Painting and Sculpture* of 1824, the chief elements of the decoration of the Egyptian Room (described as the "Black Room") were black with gilt ornaments. The background colours of the walls, ceiling, and upholstery were blue-green and pale yellow which

Hope: boudoir, The Deepdene; watercolour, 1818

Hope described as colours that “uphold conspicuous rank among Egyptian pigments”. Paintings were set in plain frames studded with Piranesian Egyptianising stars. The decoration of the Flaxman Room which housed Flaxman’s sculptures of Aurora and Cephalus was, by contrast, classical. The Indian Room was designed to display four large paintings of buildings in India by Thomas Daniell and contained “a low sofa after the Eastern fashion ... [a] ceiling, imitated from those panels in Turkish palaces ... [and] a canopy of trellis work, or reeds tied together with ribbons”. Three further rooms were used for the display of Greek vases. Every room was decorated in bright, strongly contrasting colours and was furnished with Hope’s archaeologically correct furniture imbued with an esoteric symbolism that was to become highly characteristic of his designs. The house was demolished after his death by his son in 1850.

Hope’s activity as a collector was accompanied by an active participation in the politics of art. He had been elected a Fellow of the Society of Antiquaries in 1794 and in 1800 he became a member of the influential and learned Society of Dilettanti. In the same year as he opened his Duchess Street

mansion to the public, Hope published a pamphlet entitled *Observations on the Plans and Elevations Designed by James Wyatt ...* in which he attacked Wyatt’s Neo-Classical vocabulary and unreservedly promoted Greek Revival principles.

In 1807 Hope bought The Deepdene, a country house in Surrey, and was engaged in its remodelling and improvement until his death in 1831. While the architectural components of the house were mostly classical, the planning was essentially asymmetrical and picturesque. The styles of the interiors and furnishings were, in parts, similar to Hope’s London house and included much classical statuary and an Egyptian room that was decorated “with a quantity of dull red paint” and that contained a bed copied from a plate in Denon’s *Voyage dans la Basse et la Haute Égypte* (1802). In the Small Drawing Room (also referred to as the Boudoir) and the Library, wallpaper was used to create an architectural effect. Apart from the ceiling cove, the Small Drawing Room was entirely devoid of architectural decoration. The walls were covered with an “Etruscan” pink printed paper that contained classicising details such as arabesques and garlands picked out in black and brown in the dado and frieze. Architectural emphasis came

from the green Mona marble chimneypiece, the architectonic overmantel, and the silk-hung baldachino that framed an ottoman whose design was closely related to similar furnishings illustrated by the French Empire decorators Percier and Fontaine. Deepdene was subsequently remodelled and enlarged in an Italianate style by Hope's son, Henry Beresford Hope. The house was demolished and the contents were dispersed in 1917.

Hope played an important role in disseminating Neo-Classical ideas and in promoting an ideal of archaeological correctness among contemporary architects and decorators; George Smith's *Designs for Household Furniture* (1808) was probably directly influenced by his visits to Duchess Street. But ultimately Hope influenced taste more by the general example of his seriousness of attitude and method than by the provision of specific models for imitation. Following the sale of Deepdene there was renewed interest in his designs. Many items from his collection were purchased by the playwright Edward Knoblock who recreated a number of celebrated Regency interiors in the 1920s and 1930s, and Hope's work exercised a strong influence on the Regency Revival in Britain during the second quarter of the 20th century.

Biography

Born in Amsterdam, the Netherlands, in 1769, the eldest son of a wealthy merchant. Travelled extensively in Europe and the Middle East, 1787–95. Moved permanently to England in 1795 where he established himself as a connoisseur and patron of the arts. Married Louisa Beresford 1806: 3 sons, Henry Thomas (founder of the Art Union), Adrian John, and Alexander James Beresford Hope (President of the Royal Institute of British Architects, 1865). Elected a Fellow of the Society of Antiquaries, 1794; a member of the Society of Dilettanti, 1800. Opened his London home, on Duchess Street, to the public as a lesson in taste, 1804; subsequently published several influential books on costume, architecture and interior design, including *Household Furniture* (1807) which illustrates furnishings that he designed for Duchess Street and The Deepdene, Surrey. Died in London, 3 February 1831.

Selected Works

Hope's practical work was confined to the furnishing and decoration of his own houses. Examples of his furniture are in the Victoria and Albert Museum, London, the Royal Pavilion, Brighton, the Ashmolean Museum, Oxford, and Lord Faringdon's collection at Buscot Park, Oxfordshire. An illustrated copy of Britton's *History of the Deepdene* is in the Drawings Collection of the Royal Institute of British Architects, London. The contents of the Deepdene, including much of Hope's collection, are featured in the Christie's, London, sale catalogue of 1917.

Horta, Victor 1861–1947

Belgian architect and designer

Together with Henry van de Velde and Gustave Serrurier-Bovy, Victor Horta was one of the originators and leading practitioners of Belgian Art Nouveau. In common with the foremost European designers of the period, he promoted the idea of buildings and their interiors as total works of art (*Gesamtkunstwerk*) and concerned himself with every aspect of design from the architectural structure to the smallest interior details, including furniture, furnishings, carpets, stained glass, chandeliers, door handles and domestic utensils. In his mature work of the 1890s and later, he developed a new style based on a synthesis of several different influences. These included the structural emphasis of French Rationalism promoted by Viollet-le-Duc, formal elements from the English Arts and Crafts Movement, and shapes and forms derived from nature. Horta's architecture and interior design provided a three-dimensional equivalent to the two-dimensional linear inventiveness of contemporary painters and graphic designers like A.H. Mackmurdo, Jan Toorop, Aubrey Beardsley and Fernand Khnopff, all of whom shared his feeling for natural forms combined with a deliberate freshness and exoticism.

Horta: Tassel House, Brussels, 1892–93

Horta first studied music, later entering the Ghent Academy to study drawing and architecture (1874–77). In 1878 he worked in the studio of Paris architect and decorator Jean Dubuysson, before being admitted to the Académie des Beaux-Arts in Brussels in 1881. After working as a draughtsman for Alphonse Balat (1818–95), a Neo-Classical eclectic architect, Horta produced his first independent work. This unremarkable group of three houses in Ghent, 1885, drew on Belgian traditional architecture for inspiration and in no way presaged the innovative Tassel House, built in Brussels in 1892 and 1893.

Described as “a work of complete assurance, outstanding for its synthesis of architecture and the decorative arts and its declaration of new formal principles”, (William J. Curtis, *Modern Architecture Since 1900*, 1982) the Tassel House was the first of a series of extravagant and spectacular town houses designed for a wealthy, urbane, fin de siècle clientele with exotic tastes. The principal innovation of these houses lay not in the design of their restrained stonework façades, but in their spatial planning and decoration. Spacious stairwells and long internal vistas through dining rooms and glazed, interior winter gardens were common elements. In order to allow plenty of light into the office and study of the Tassel House, Horta contrived a series of changes of level on each floor, linked by a central stair-corridor with light wells on either side. Cast-iron columns carried the loading. The resulting openness

of structure and exciting spatial fluidity created an unprecedented lightness in the centre of such a narrow house. The staircase was particularly innovative, with its frank expression of the metal structure and its sinuous, tendril-like ornamentation transforming gradually into the vegetal shapes of banisters, patterned stucco walls and floor mosaics, glass and woodwork. This continuity, suggestive of organic growth and tension, invoked contemporary interests in “empathy” and organic symbolism.

In the Van Eetvelde house (1895), Horta carefully orchestrated a processional route from the front door to the salon, again involving a series of changes of level, in order to impress the visitor with spatial drama. A great circular double-height space covered by a colourful, top-lit glazed dome, was devised as a central living area and communication core for the house. Here the use of sinuous shapes of iron, wood and plaster, suggest climbing stalks and clinging tendrils, and produced the effect of a suddenly fossilized conservatory. In the Aubecq house (1889–1902) Horta linked together a suite of polygonal rooms into a subtly modulated flow of space. American architects, such as Frank Lloyd Wright provided the sources for this approach to internal space, but it was Horta’s exploitation of the structural possibilities of iron and steel, allowing the dematerialization of internal walls and different floor levels, which added a completely new dimension. Mirrors created further spatial ambiguity, as instanced at top of the staircase in Horta’s own house and office at 23–25 rue Américaine (1898).

In the Hôtel Solvay (1895), designed for the industrialist and chemist Armand Solvay, Horta’s credo was successfully expounded throughout the scheme: in the linking of interior volumes, in the furniture and fittings (all extant) and in the treatment of the façade, where an appropriately linear ornament was displayed. Light fittings were all consistently designed as flowering plants with long, upright or nodding stems terminating in sprays of metal or glass petals holding conspicuously naked bulbs. They entwined themselves around the stair rails, rose gracefully from the sides of fireplaces, or drooped in elaborate clusters from ceilings, flooding light over the carved wood furniture and walls. In these houses Horta’s Art Nouveau detailing allowed him to use his preferred materials such as iron and steel for structural emphasis, in close conjunction with the costly materials expected of a sumptuous interior: marble, stained glass, Liberty silks, gold, bronze, mosaic, Padouk and pine, mahogany and bilinga. In the dining room of his own house the honey tones of the elegantly fashioned ash furniture harmonise with the copper picture-rails and painted decoration. White-enamelled bricks were used in place of wallpaper and the floor covering is wood parquet with a mosaic border with copper inlay to echo the linear motifs of the painted ironwork supports. Horta’s elegant style created an ambience of luxury which is not associated with the more austere “honesty” of van de Velde’s furniture and interiors.

Horta’s Maison du Peuple (1895–98; now demolished), built as the headquarters of the Belgian Socialist Party, was intended to provide labourers with a meeting place equal to the dwellings of the bourgeoisie. Constraints in the requirements and funding for the building presented a challenge. Two large public spaces were needed; a cafe, where people could meet daily and talk, and a large auditorium for party meetings and stage presentations, that was capable of seating 2000 people.

Several offices and smaller meeting rooms were also required, and as much of the street frontage as possible had to be used for shops. The site was a difficult one, the overall shape of the building being dictated by the circular Place Emile Vandervelde, and the two streets that enter it at an angle. The façade was designed as a continuous, but irregular series of mostly concave curves and was constructed in masonry, iron and glass. The integration of material, structure and expressive intentions was most successful on the interior, especially the main auditorium at the top of the building where the roof was formed from a sort of hammer-beam system in steel, with gracefully inclining curving girders carrying the galleries at half their height. The foliate iron decoration swarms energetically over the gallery railings. The auditorium was enclosed only by glass or by thin infill panels creating a volumetric lightness which recalls some early 19th century engineering structures, while at the same time anticipating 20th-century developments. This interior is one of the few which successfully combine Art Nouveau decoration with a genuinely Art Nouveau curvilinear structure to form an organic unity.

The 1901 Brussels department store, L'Innovation, shows the extent to which the structural elements of the metalwork, externally as well as internally, were even more affected by a curvilinear aesthetic. Here, as in the Grand Bazaar in Frankfurt (1903), Horta was concerned to exploit the new possibilities offered by steel and glass to create large internal spans and allow for wide openings.

In about 1905 Horta abandoned the Art Nouveau style, and in 1912 he became a Professor at the Académie des Beaux-Arts, later serving as its Director. In 1913 he was made a baron. He lived in America from 1916 to 1918, returning to Brussels after the war. His later architecture, well represented by his concrete Palais des Beaux-Arts (1920–25), was classical and severe, in contrast to his earlier work, which was to prove more influential in the development of modern architecture.

Biography

Born in Ghent, 6 January 1861. Studied architecture at the Academy of Fine Arts, Ghent, 1874–77, and at the Academy of Fine Arts, Brussels, to 1881. Married 1) Pauline Heyse, 1881 (divorced 1906); 2) Julia Carlsson, 1908. Apprenticed to the architect-decorator Jean Dubuysson, Paris, 1878–80; assistant in the office of King Leopold I's architect, Alphonse Balat (1818–95), Brussels, 1884–85 and worked intermittently with this firm until 1892. In private practice, Brussels, 1886–1915; lived in London, 1915 and in the US, 1916–18; returned to Belgium and resumed practice in Brussels, 1919–47. Appointed lecturer in design at the Université Libres, Brussels, 1892, and professor of architecture, 1902–15; professor, Academy of Fine Arts, Brussels, from 1912, and director 1923–25, 1926–29, 1930–31; professor of Fine Arts, Académie Royale de Belgique, 1919; professor of architecture, Institute of Fine Arts, Antwerp, 1920. Exhibited at numerous international exhibitions including Turin in 1902, and Paris 1925. Received several prizes for architectural projects, 1887–92; awarded Légion d'Honneur, 1926; Ordre de la Couronne, 1936. Died in Brussels, 11 September 1947.

Selected Works

A chronology of Horta's life, including a complete list of his architectural projects, appears in Borsi and Portoghesi 1991. Much of the

documentation relating to his practice and his career was sold for scrap in 1946 and has been destroyed, but some archival material survives in the Victor Horta Papers held at the Musée Horta, Brussels.

Interiors

- 1892–93 Tassel House, Brussels (building, interiors and furnishings)
- 1893 Autrique House, Brussels (building, interiors and furnishings)
- 1895–1900 Hôtel Solvay, 224 Avenue Louise, Brussels (building, interiors and furnishings)
- 1895–98 Maison du Peuple, Place Emile van de Velde, Brussels (building and interiors)
- 1895–1900 van Eetvelde House, 4 Avenue Palmerston, Brussels (building, interiors and furnishings)
- 1898 Horta House and studio (now Musée Horta), 23–25 rue Américaine, Brussels (building, interiors and furnishings)
- 1899–1902 Aubecq House, 520 Avenue Louise, Brussels (building, interiors and furnishings)
- 1901–03 L'Innovation Department Store, Brussels (building and interiors, with the sculptor Van der Stappen)
- 1902 Belgian Pavilion, International Exposition of Decorative Arts, Turin
- 1903 Grand Bazaar Department Store, Frankfurt (building and interiors)
- 1903 Waucquez Department Store, 20 rue de Sables, Brussels (building and interiors)
- 1903 Max Hallet House, 346 Avenue Louise, Brussels (building and interiors)
- 1909 Wolfers Store, 11–13 rue d'Arenberg, Brussels (building and interiors)
- 1920–25 Palais des Beaux-Arts, Brussels (building)
- 1925 Exposition des Arts Décoratifs, Paris (Belgian Pavilion building and interiors)

Horti, Pál 1865-1907

Hungarian designer

Pál Horti's early death and perhaps even his nationality as a Hungarian account for the fact that he is a relatively unknown figure in the history of interior design. Yet his designs at the height of his career in the late 1890s and early 1900s were warmly regarded by his contemporaries in Europe and the United States. One commentator viewing his schemes for the Hungarian Pavilion at the Turin Exhibition in 1902 described them as "original expressions of the new movement in Hungary". Furthermore, they have become increasingly understood as key works in the national movement for design reform in Hungary in the 1900s and as important international conveyors of Art Nouveau.

Horti was born Pál Hirth into an artisanal family in Pest at the beginning of a great phase of growth in the Hungarian capital and the opening of a so-called "golden age" in Magyar culture. Following the Compromise, a political agreement made between Hungary and Austria in 1867 which extended some autonomy to the Magyars in return for loyalty to the newly founded Dual Monarchy, Magyar nationalism flourished in all fields of culture. This took a variety of forms from neo-Romantic Vernacularism at the turn of the century which invented an idyllic vision of Hungarian life in the isolated rural region of Transylvania to the Modernism of industrial investment and urban growth advocated by a confident bourgeoisie. In his career Horti also displayed his nationalism in a variety of ways. In the late 1890s he relinquished using his German-sounding name in favour of its Hungarian equivalent and while his mature designs share characteristics found in Belgian and English work of the period, they also make reference to vernacular traditions in their wooden constructional forms and traditional peasant embroidery. In fact, in 1902 *The Studio* reported that Horti (and Istvan Gróh) had been commissioned by the Minister of Commerce to tour rural Hungary giving advice to village potters on modern glazing and decorating

Horti: interior designed for the Hungarian pavilion, 1902
Turin Esposizione Internazionale

techniques. The results of this venture combining traditional forms with modern skills were of "the highest artistic merit".

After completing his training in a vocational school in Budapest where he studied drawing and furniture design, Horti resolved to become a painter. In the 1880s he studied in Munich, London and Paris. Although his studies and the exhibition of his work did not bring him great acclaim, it nevertheless helped Horti secure a position as a lecturer in painting at the Budapest School of Applied Art (Iparrajziskola) in 1890. As the influence of the English Arts and Crafts Movement began to spread in artistic circles in the city, Horti was again attracted to the applied arts and, in fact, in 1895 returned to Munich to study different graphic techniques in the design of decorative patterns. Following the principles of design reform movements found across Europe, Horti's curiosity led him to experiment with a wide variety of materials and techniques. He learned, for example, not only how to design ceramic vessels but also how to throw, glaze and fire his projects. He established a close relationship with some leading Hungarian manufacturers such as the Nagybecskerek textile factory.

Horti's mature style of design emerged relatively rapidly in the course of the 1890s. While his early works displayed a strong strain of historicism, often derived from Rococo sources, he established a decorative language in a series of designs for flat decorative patterns used in stained glass and carpets exploiting arabesques, exaggerated floral motifs and strong tonal contrasts that became recognised as a Hungarian variant of Art Nouveau. Horti's major works were a small number of designs for interiors. In touch with the spirit of the *Gesamtkunstwerk* (total work of art) found in the oeuvre of the leading Viennese Modernists such as Josef Hoffmann, his unified interiors were marked by a strong aesthetic sensibility. A 1902 prize-winning interior designed for a Society of Applied Art (Magyar Iparművészeti Társulat) exhibition and made by the firm of Vukovics and Kaufmann, for example, came entirely from Horti's drawing board. An oblong shape recurred throughout this design both as a motif and as a proportional principle; his furniture designs were emphatically undecorated though Horti exploited the expressive qualities of

the constructional elements of his furniture designs such as joints; and his designs were richly coloured.

Horti was responsible for a number of interiors for various Hungarian pavilions at international exhibitions in the early years of the new century. His designs featured at the Paris Exposition Universelle in 1900 where he was awarded a gold medal for his carpets and furniture, as well as his ornamental designs. Such was his reputation as an important advocate for Art Nouveau, that in 1904 he was asked (with the support of a small group of architects and designers including Geza Maroti and Ede Thoroczkai Wigand) to oversee the design and installation of the Hungarian display at the St. Louis International Exhibition. Reinforcing the peculiarly Hungarian mix of Art Nouveau and the vernacular, the façade of this display was styled as a Transylvanian country house with characteristic wooden fencing and a Székely gate. Horti reported the successes of the Hungarian display to his compatriots in a ringing article in the pages of *Magyar Iparművészet* (Hungarian Applied Art). In this report he also claimed that the measure of the Hungarian success could also be taken in the “brilliant contract offers” that he and his colleagues received from American companies. While little is known about these offers, Horti did create a number of furniture designs for American manufacturers including a large, wooden upholstered chair. This low, simple design, known as a “Morris Chair”, was part of a library suite commissioned by Oscar Onken Co. of Cincinnati in 1905.

In April 1906 Horti travelled to San Francisco from where he planned to travel to Mexico then across the Pacific to Japan and China and through Asia collecting works for display in the Budapest Museum of Applied Arts. He succeeded in making only part of this journey. In Mexico he caught Yellow Fever and while he continued his voyage, he died in May 1907 in Bombay. His grave in Budapest was testimony to his high reputation among his colleagues, for it was designed by sculptor Ede Telcs and decorated with a mosaic panel by Miksa Róth.

DAVID CROWLEY

Biography

Born Pál Hirth in Pest, 1865. Studied drawing and furniture-making in Budapest. Trained as a painter in Munich, London and Paris, 1880s. Appointed lecturer in painting, Budapest School of Applied Art, 1890. Active as a designer of ornament, textiles, furniture and interiors from the mid-1890s. Exhibited at the Paris Exposition Universelle, 1900, and the St. Louis International Exhibition, 1904. Travelled to San Francisco and South America, 1906. Died in Bombay, May 1907; buried in Budapest.

Hotels

The evolution of the hotel followed the evolution of travel and in the sense that we use the word today – “a superior kind of inn” – it dates only to 1765 when some sophistication was replacing the plain necessities of the inn. A short list of late 18th century hotels may give some idea of their levels of comfort and efficiency of management as most were the subject of recommendation by literary travellers. Unfortunately, though, little indication of their interiors was recorded. The Rotes Haus in Frankfurt, which housed royalty, and the Drei Mohren in Augsburg were well-known. The latter was rebuilt in 1722–23 with a Rococo and pilastered exterior. It housed a ballroom which, as many expert stuccoists were working in Augsburg at the time, may well have had a correspondingly decorative interior scheme. In France, little remains of the large and famous Dessin's Hotel complex in Calais (1768) or of the Henri Quatre in Nantes (1782). The Lion Hotel at Shrewsbury had an assembly room added about 1775–80; it was plain but elegant, with an apse at one end and semicircular-headed windows.

From ancient times spring waters have been recognised for their medicinal qualities, and by the early part of the 19th century the spas in Europe, named after Spa, a town in Belgium, were becoming popular centres for health-seekers. This attracted entrepreneurs with a mercenary interest in building accommodation to house these visitors. One of the first spa hotels was the Badischer-Hof at Baden, converted from a Capuchin monastery by the Neo-Classical architect Friedrich Winbrenner in 1809. The church was turned into a majestic banqueting hall with music and conversation rooms; the former cloister was transformed into a dining hall, being covered by a gigantic barrel vault supported by 18 giant Doric columns, with galleries on three floors. This monumental space was lit by a skylight and in the later 19th century was turned into a staircase hall. Although much extended, the hotel still survives recognisably. At Wiesbaden, architect and developer J.C. Zais designed the Hotel Vierjahreszeiten (1817–18) as part of a symmetrical town centre plan. It had 150 rooms, 44 baths, and a banqueting hall to seat 124 “adorned by a spectacular array of columns” (Watkin, 1984). Only vestiges remain after destruction in World War II. A comparable English complex was built in Plymouth as the Royal Hotel and Athenaeum (1811–19) incorporating a large Dining or Tea

Room for Assembly, a Commercial Room, Billiard Room, suites of sitting, dining and bedrooms (with scant provision of sanitary accommodation), a Bar and Coffee Room, as well as a Theatre. The building was designed in the Neo-Classical style by the architect John Foulson. Other popular spa towns of this period, including Bath, Brighton and Leamington, also had hotels; the best example still in use is the Regent Hotel, Leamington Spa (1819) by C.S. Smith, a pupil of Sir Jeffry Wyattville.

In 1825 the first steam railway was opened between Stockton and Darlington in the north of England and almost instantly revolutionised travel on land. Steam-powered transport increased the pace of life, affecting the construction of buildings, the development of technology, and the mobility of the populace wherever the railroads spread. The hotel world entered a period of accelerated development which, except in time of war, has scarcely slowed. The United States, Canada, France, Belgium, and Germany all opened railway systems within the space of ten years.

Hotels in the United States had, from their first introduction at the end of the 18th century, been large and fitted out with all the available amenities. The first in New York was the City Hotel (1794–96) with 73 rooms on five floors though “really no more than two houses”. Boston’s Exchange Coffee House (1806–09) by architect Asher Benjamin, was larger, with seven storeys, a domed atrium with classical pillared galleries, and 200 apartments. The ballroom had three domes and 12 Corinthian columns and the dining room was over 70 feet long. The Tremont House, Boston (1827–30) became a landmark in hotel quality. It was designed by Isaiah Rogers and was featured in some detail in Charles Dickens’s *American Notes* of 1842. Dickens commented on the “boarders, both married and single, many of whom sleep upon the premises” as though this was unusual, but in America there was already a tradition of residential hotel accommodation which offered a permanent way of life far less easily achieved by the private individual. The Tremont House had 170 rooms and could seat 200 in its dining room. Its management was innovative in training staff to be respectful to the customers, and in providing room keys, proper curtains, a rug, and, best of all, a piece of soap with the washing water. Having seen the Tremont House, J.J. Astor briefed Rogers to design him a New York hotel which would exceed it in size and quality. The result, the Astor House (1832–36), had 309 rooms, 17 basement bathrooms, and privies on the upper floors, and was described as “the marvel of the age”. Some classical Greek Doric design elements persisted, corridors as well as rooms were carpeted, and American black walnut – perennially a favourite joinery timber – was widely used for fittings.

On both sides of the Atlantic large hotels proliferated, providing varying degrees of luxury. The United States has always tended to excel in matters of size and was usually first with new types of equipment. Bed springs, which had been invented in Massachusetts in 1831, were not mass-produced for a further 40 years, but thereafter made a great contribution to comfort. Steel-framed buildings and hydraulic or electrically powered “rising rooms” added greatly to the possibilities of height and size. Well-known pioneering hotels of the time were the Palmer House, Chicago (1870) which burnt down, and the

Palace Hotel, San Francisco (1875) destroyed in the earthquake of 1906 in spite of precautions against fire.

Summer and resort hotels in the middle of the 19th century catered for great numbers of people; for many, their accommodation may have been a small bedroom with access to a distant bathroom and meal service in a vast dining room. Figures cited for the Mount Vernon Hotel at Cape May, New Jersey (1853–56) were 9½ feet square for the bedroom and 425 feet long for the dining room, so it is not difficult to understand the popularity of family suites or private cottages with their own bathrooms. The Mount Vernon, timber framed and generally sparsely furnished, had been planned to accommodate 2100 guests but it too burnt down even before final completion. Saratoga Springs in New York State, with its spring waters and race track, became fashionable in the 1860s. Saratoga’s United States Hotel, which was rebuilt in 1875 following a fire, claimed to be the largest hotel in the world. Nearby, the Grand Union Hotel by J.A. Wood, architect, vied for the same distinction and boasted a 305-foot dining room to serve 1400 people. In addition, it had 12 acres of carpet, an acre of marble tops and tiles, and a mile of covered piazzas. Crystal chandeliers, black walnut stairs, and a steam-powered elevator by the Otis brothers were listed by the local press when the whole property was sold after the owner’s bankruptcy.

In Canada, the hotel network followed closely on the construction of the Canadian Pacific Railway. Plain and basic designs such as the first Vancouver Hotel (1887) by Thomas Sorby were overtaken by the tourist-orientated enterprises of CPR Hotels. The firm’s first project was the Banff Springs Hotel (1888) designed by the New York architect Bruce Price and executed under the direction of the company president Cornelius Van Horne, for whom impressive planning and design were matters of policy. It was a first step in the development of the “château style” and attracted international interest in its siting and amenities. The Château Frontenac, Quebec (1893) by the same architect, was soon redecorated and refurbished by Kate Reed whose taste for European antiques and *objets d’art* was allowed full rein in other CPR hotels including the Place Viger Hotel, Montreal; the Empress, Victoria, British Columbia; Royal Alexandra, Winnipeg; and Glacier House, Mount Stephen House, and Chalet Lake Louise, all in the Rockies. All Mrs. Reed’s schemes were planned in detail down to harmonising or matching linen. The overall effect was a successful blending in the interiors of domestic comfort and pleasant atmosphere with monumental scale and historical allusions.

New mid-century European hotels were substantially less spectacular in capacity and size than their Northern American counterparts and were developing from a totally different background in which a network of hotels already existed with long-established standards arising from visits by royalty, nobility, or gentry who required comfort, good food, and service. Interiors followed the fashions of the times with a leaning towards classical grandeur and much ornamental detail in the large public spaces. Good representative examples existed in Paris beginning with the Grand Hôtel du Louvre (1855), which had 700 bedrooms and the great advantages of originating under the general benevolence of Napoleon III and of being designed in the Second Empire style. The architects, A.

Armand, J. Hittorf, C. Rohault de Fleury and A. Pellechet, had the earlier Great Western Hotel in London as a model on which to expand and improve. The Grand Hôtel survived until it was replaced in 1927 by another hotel. The Hôtel de Crillon had different origins, having been built originally behind the majestic colonnade of the Place de la Concorde by L. Trouard as a Parisian town house in 1765. It was not put to use as a hotel until 1909 and the interiors of many of the main rooms were skilfully remodelled in 1912 by H. Destailleur in Louis XVI style. The *belle époque* ambience can be savoured in the Continental (now Intercontinental) built in 1878 to designs by H. Blondel and influenced by Charles Garnier. It retains magnificent Second Empire interiors, and features luxurious sculpture and red and gold painted and gilded columns. A Moorish room imitated the details and decor of the Alhambra in Granada.

Monaco's Hôtel de Paris (1862) was developed four years before the railway connection, by Francis Blanc who already ran the casino and was also able to succeed with the hotel. It was enlarged by Dutrou in 1865. Its rotunda entrance hall, with a glazed dome and sculpted naiads and tritons, now incorporates much of the lavish 1908 remodelling by Edouard Niermans. The Hôtel de l'Ermitage in the same area dates from 1890 and shows local architect J. Marquet indulging in a delightful confection of stained glass and Art Nouveau in the cast iron rotunda, used as a winter garden. The oval Louis XIV dining room ceiling was designed by A. Levasseur and painted by G. Ferrier. The town of Menton eastwards along the coast had developed ten years previously with several Baroque / Rococo / Moorish six-to-eight storeyed hotels, now used as apartments and offices, but of which the Riviera Palace, designed by Abel Gléna, is perhaps the most interesting. This had a columned entrance hall and a small integral theatre originally with a sliding roof to be open or closed as required. Nice, to the west, has remained more fashionable than Menton, and the memorable Negresco (1912) is another example of Niermans's work with a large glazed dome over the Salon Royal on the ground floor supported by paired Ionic columns and scrolled iron cantilever brackets made by Gustave Eiffel, designer of the Eiffel Tower. The central chandelier by Baccarat is similar to one supplied to the Tsar of Russia and the Savonnerie carpet is claimed to be the biggest ever made. The same architect executed a design much resembling this salon for the Palace Hotel in Madrid at the earlier date of 1909.

Switzerland built up a reputation for hotel management which has never been surpassed and which created its own hierarchy. Johannes Baur, whose hotels Baur en Ville and Baur au Lac, Zurich (1837 and 1844), are still in existence, was among the pioneers of the Swiss hotel establishment. Alphonse-Rodolphe Armelder opened the Grand Hotel Richemond in Geneva (1875) and three generations later it is still run by his family. A restored Art Deco façade conceals eclectic interiors in Louis XV, Louis XVI, Empire and Napoleon III styles. In St. Moritz Johannes Badrutt had first built the Engadiner Kulm, and, as the resort expanded his son Caspar carried on the family enterprises with the Palace (1896). His architects Chiodera and Tschudi departed from classical models on his instructions which resulted, in Raymond Flower's words, in a "combination of mountain

schloss and baroque château, with gingerbread features such as turrets and arrow-slits, all topped by a great tower". The resulting profile, restored after serious fire which destroyed the tower in 1967, adds distinction to St. Moritz just as the interior Victorian Gothic pine-panelled public rooms, with more than a touch of the required Baronial manner, attracted the noble and the rich. The original Badrutt hotel which was incorporated in the present palatial one, was supplied in 1878 with hydro-electricity generated from the river Inn and this was used to light the dining room – the first electric light in Switzerland, we are told. The new building was short on private bathrooms – three only in a total of 140 bedrooms plus one more for communal use on each of three floors. A ladies' drawing room, a men's smoking room, a library, and a billiard room augmented the large dining and ballrooms.

César Ritz epitomised the skill and attention to intricate detail needed to produce service of the highest possible standard. From Switzerland and the Côte d'Azur he came in 1889 to manage the Savoy in London and was later involved with the Carlton. His co-operation with architect Charles Mewès resulted in the creation of several hotels which took his name, in Paris, Madrid, and London. Ritz hotels which had no direct connection with César multiplied, in much the same way as Bristol hotels did during the 18th century and later, which claimed no contact with the eccentric Earl-Bishop of Bristol other than a certain standing derived from this persistent traveller's name.

The Grand Hotel in Stockholm (1874) has had a long and consistent history as an important asset to Sweden's capital. Architect Axel Kumlien designed it with neo-Renaissance exterior, the main banqueting hall being influenced by Brunelleschi's church of San Lorenzo, Florence. The basement Porcelain Café, with slightly Moorish references, had walls and ceiling lined with lime green tiles. These interiors disappeared with the 1898 alterations from which the white and gold Mirror Room emerged which survives today. Designer Thure Steuberg went to Versailles for his model, adding gilded Corinthian columns and a small stage. The resulting room accommodated the most important Swedish functions until 1929 when the next Stockholm Town Hall presented an equally distinguished setting in a modern idiom.

Two central European spa hotels have survived in partially changed form. The Grand Hotel Pupp takes up the spa theme in 1893 in the long-established town of Carlsbad (Karlovy Vary) which was well accustomed to visitors. The Pupp family, after years of assembling a central site adequate for their ambitious plans, commissioned Viennese architects Ferdinand Fellner and Hermann Helmer to develop their land to include a Festival Hall and Restaurant (1905–07) flanked by two hotel wings totalling 270 rooms. Neo-Baroque characterises the interiors in the form of the rich stuccowork, which abounded in the Austro-Hungarian Empire. Politics and wars disrupted the old luxurious spa life and, after numerous vicissitudes, the hotel found itself by the late 1950s known as the Grandhotel Moskva as it remained until 1989. Unsympathetic restoration after a fire spoiled the south side, although much else has fortunately been preserved as has a certain amount of historical atmosphere. The Hotel Gellért in Budapest was completed in 1918, the work of Artur Sebestyén, Izidor Sterk and Armin Hegdüs; the interior work was under the direction of Ferenc

Szjaba. The main hotel rooms have largely been modernised with little character, but the adjoining medicinal baths, with original tiling, sculpture, and faience work as well as a sliding roof, retains the Art Nouveau character in the main bath halls area.

Also in the 20th century the Hotel Metropol, Moscow (1905), is surprisingly the work of an Englishman, William Walcot, who was commissioned by the financier and art patron Savva Marmontov to prepare designs and carry out the work for the new hotel even though he had not been a winner in a previous competition for the project. The hotel turned out to be a success which lasted until the October Revolution in 1917. Its Art Nouveau-flavoured interiors, called *style moderne*, are attributed to A.E. Erikson and were augmented by other Neo-Classical and neo-Baroque schemes.

In Britain the advent of the railways brought with it the introduction of the railway hotel. Notable in London were the Great Western Royal, Paddington (1852) by Philip Hardwick, the Grosvenor, Victoria (1861) by James Knowles, the Charing Cross (1863), by E.M. Barry, and the Midland Grand Hotel, St. Pancras (1876) by Sir George Gilbert Scott. Interiors improved from the barn-like coffee room at the Great Western through the heavily carved stonework in the hall of the Grosvenor to the high Victorian Gothic at St. Pancras, with intricately decorated and painted structural wrought iron work, a world away from its contemporaries on the Continent. Scottish resort hotels were opened when rail systems reached northwards, in part-classical, part-baronial styles and throughout the country good railway and non-railway hotels were built to provide a very acceptable level of accommodation and service.

American tourists and businessmen took full advantage of easier long distance travel at home and abroad and returned with many ideas and plans. Lifts, electric power, centrally-fired heating, telegraph and telephones were installed, new fashions and manners were observed, and hotels became skyscrapers. Rooms multiplied in number, aiming at 1000 or more – the Stevens in Chicago reaching 3000 – against the norm in, for example, Switzerland of about 300 for large hotels. Historicism dwindled except for the occasional fantasy such as the Moorish style Tampa Bay Hotel, Florida (1891) by J.A. Wood, which, eccentrically, depended for some of its steel reinforcement on unwound cable from old submarine telegraph lines and cable car wires. A number of rural sites inspired more designs in the vernacular idiom and Frank Lloyd Wright produced not only the outstanding Imperial Hotel in Tokyo but also the Arizona Biltmore, Phoenix, in which he supplied design ideas direct to the builder Albert Chase McArthur in 1929. The Greenbrier, White Sulphur Springs, West Virginia should be mentioned as one of the most prestigious resort hotels in the United States, with a long history and many transformations. It was completely refurbished after World War II, re-opening in 1948 with attention to every small detail in the sophisticated, elegant classical-cum-Victorian interior by Dorothy Draper.

Fashion in hotel decoration before and after World War II often adopted the English Country House style, which was suitable for both renovating older buildings and fitting out new hotels. The Dorchester, Park Lane, London (1931), by W. Curtis Green, was one of the latter and opened to great acclaim

for its highly successful interiors, charming and comfortable as well as lavish and extremely well-equipped. Five main suites were decorated by five different designers with the Oliver Messel Suite being regarded as the most notable. This was restored closely to its original state with the help of Messel's sometime assistant, John Claridge, in the 1989–90 redecoration.

The Midland Hotel, Morecambe, was designed as a railway hotel by Oliver Hill in 1933, replacing the early 1848 North Western Hotel. The design is unique in its complete commitment to the Modern Movement of which it is an excellent example, with sculpture and relief work by Eric Gill, a mural by Eric Ravilious, and specially designed rugs by Marion Dorn. Under private ownership it has now been restored after years of deterioration.

In recent decades travel has come within the reach of many and the railway hotel industry in a large part of the world is able to provide the traveller and tourist with reliable plumbing and heating, usually an en suite bathroom, comfortable beds, adequate cupboards and shelves, telephone, and a television set to supply world-wide news. An increase in outdoor activities and sightseeing has reduced the need on the regular tourist circuits for impressive rooms, although in existing historic buildings they are certainly regarded as assets. Pacific islands, Indian palaces, and African safari are accessible at the higher end of the scale and the state-run *paradores* and *pousadas* in Spain and Portugal have pioneered current conservation policies in restoring and adapting outstanding historic buildings for hotel use. Commercial hotel chains which standardise planning, equipping, and catering have played an important part in making the timid traveller feel more at home in strange places. The United States has again led the field as such familiar names as Hilton and Sheraton with their corporate design styles repeated in many different parts of the world bear witness. Air travel and motoring on a continental scale have provided the mobility which underpins the entire scene.

I

Ince and Mayhew

British cabinet-makers and upholsterers, 1759–1804

The prominent and long-lasting partnership of William Ince and John Mayhew began in 1759 in premises opposite Broad Street, in Carnaby Market, London. Both partners were young men not long out of their apprenticeships. Mayhew had served his time with William Bradshaw an upholsterer, and Ince trained with John West, a cabinet-maker of some repute. This valuable combination of the two main furnishing skills would stand them in good stead in the development of their business. Not only did they have the advantage of a good training, but by taking over the premises and part of the stock of an established business they ensured themselves a substantial start in trade.

Almost immediately after embarking upon their business they began to publish designs, as a way of advertising their business and creating trade, no doubt following Chippendale's successful example. In a listing in the *Gentleman's Magazine* of 13 July 1759 it was recorded that: "A general system of useful and ornamental furniture by Mess. Ince and Mayhew, [is] publishing in numbers at 1s each". The venture was initially to have had 160 plates but the difficulty of meeting deadlines for regular publication made the partners decide to amalgamate the designs and add a small metalwork section to make 101 plates. This was published in book form in 1762 under the title *The Universal System of Household Furniture*. The layout of the volume is directly based on Thomas Chippendale's *Director*, and Matthias Darly, who engraved most of the plates for Chippendale, was also responsible for those in the *Universal System*.

Although the designs were based on an interpretation of the Rococo style they have their own characteristics. Ward-Jackson has defined some of them as having "the frequent use of elaborate symmetrical patterns, half Gothic and half Rococo, executed in fretwork and applied blind to panels or used as an open-work filling for a frame" (Ward-Jackson, 1984). Some of the designs in their pattern book owe a little to contemporary French taste, especially in upholstery. For example, a design for a bergère chair with a bolster, and a couch with three graduated cushions at the back reflect contemporary and fashionable French taste. It is also noteworthy that the title page and notes of the *Universal System* were translated into French, no doubt

intended to indicate a knowledge of the prevailing fashionable taste as well as a desire to spread their markets abroad.

The criteria that were employed by tradesmen and customers to ensure a furnishing scheme that was both functional and attractive were clearly defined. In the preface to the pattern book it was remarked that: "In furnishing all should be with propriety. Elegance should always be joined with a peculiar neatness through the whole house, or otherwise an immense expense may be thrown away to no purpose either in use or appearance."

The pattern book was apparently successful, even though Chippendale had published his third edition of the *Director* in 1762. Sheraton considered that the *Universal System* had "been a book of merit in the day, though much inferior to Chippendale which was a real original, as well as more extensive and masterly in Design".

As well as being a partnership of cabinet-maker and upholsterer, the business was also divided upon other skills. Ince was the partner who dealt with the designing, while Mayhew supplied capital and managerial skills. This division of labour appears to be one of the first conscious attempts explicitly to separate the profession of designing from the running of the business. Mayhew, for example, dealt with Sir William Chambers, the supervisor of commissions for the Duke and Duchess of Marlborough. On another occasion it was Mayhew who attended to Boulton and Fothergill's complaints about faulty glass. Although Mayhew was considered to be the entrepreneur and financial manager of the partnership, his supervision of the accounting side of the business appears to have left a lot to be desired; he made out only nine partnership balance sheets in the 45 years of trading.

Ince's early interest in design is evidenced by his subscription to Chippendale's *Director* in 1754 and his ownership of important architectural treatises. He was the main contributor of designs to the *Universal System* and his skills were also required for patterns to be published in a joint trade venture entitled *Household Furniture in Genteel Taste* (1760).

As with many 18th-century comprehensive furnishing firms, the partners were also dealers. Specific mention of glass and furniture for export, runs parallel to such offers as "An assortment of French furniture consign'd from Paris for immediate sale very much under the original cost, which may be seen at their warehouse Broad Street Soho".

The partnership was clearly well-thought of and highly

Ince and Mayhew: design for a dressing room, 1762

respected both by its customers as well as its employees. In 1775, Ince and Mayhew asked for apprenticeship fees of £210, a record for a furniture-making fee, which is indicative of their high reputation. They were also employed by many of the most important architects and clients of the time.

Although the partners initially employed a Rococo style, in their work for Adam at Croome Court they developed a Neo-Classical manner of design which was to be highly valued. In 1768 Lady Shelburne noted the details of a visit to the partnership in her diary. "To Mayhew and Inch [sic] where is some beautiful cabinet work and two pretty cases for one of the rooms in my apartment, and which though they are only deal, and to be painted white, he charges £50.00 for". In 1775 the firm supplied an important satinwood and marquetry commode for Robert Adam's patron the Earl of Derby. This was one of a range of superb commodes finished with marquetry work, exotic veneers and ormolu mounts that are now associated with them.

Both Mayhew and Ince were elected as directors of the Westminster fire office for various periods of office. This connection no doubt helped the firm secure a 1792 order for 18 new chairs for the office. However it was not an easy commission, as the board of Directors told Ince and Mayhew that "the charge of making desk and chairs is high and wish to refer it to their consideration".

The partnership also supplied furniture to the instructions of Henry Holland for Carlton House in the 1780s. This encouraged the development of a squared off classical style which later evolved into typical Regency forms. The partnership formally continued until 1799, but they remained in business in a reduced way until 1804 when Ince died. Mayhew continued trading under the partnership title until 1808.

CLIVE D. EDWARDS

Selected Works

Examples of Ince and Mayhew's furniture survive *in situ* at Cobham Hall, Burghley House and Caledon Castle; a marquetry cabinet made for Kimbolton Castle, Huntingdonshire is now in the Victoria and Albert Museum. Only one drawing can be firmly attributed to the firm (Victoria and Albert Museum) but miscellaneous bills and accounts survive in country house archives including Burghley. A full list of the firm's commissions appears in Beard and Gilbert 1986.

Interiors

- 1761-1803 Cobham Hall, Kent (bedroom and seat furniture): 3rd and 4th Earls of Darnley
- 1764-94 Croome Court, Worcestershire (furnishings; interiors by R. Adam): 6th Earl of Coventry
- 1767-79 Burghley House, Lincolnshire (furnishings for private apartments): 9th Earl of Leicester
- pre-1773-93 Blenheim Palace, Oxfordshire (furnishings for private apartments; interiors by W. Chambers): 4th Duke of Marlborough

- 1783-96 Caledon Castle, Co. Tyrone, Ireland (furniture, carpets and curtains): 1st Earl of Caledon
 1787-92 Daylesford House, Gloucestershire (furnishings; building and interiors by S.P. Cockerell): Warren Hastings
 1787-93 Woburn Abbey, Bedfordshire (furnishings for bedrooms): 5th Duke of Bedford

Publications

India

From the dissolution of the Roman Empire, India's wealth had always been greater than that of Europe, and when traders began to bring back tales of the opulence of the new Mughal dynasty from the mid-15th century, the interest of the West grew. Before long, imported Indian goods and designs began to influence Western products – particularly textiles. With the colonisation of the subcontinent, this influence became reciprocal and the history of Indian design and interiors from the 16th century to the present day includes a rich vein of cross-fertilization between East and West. This essay examines that cross-fertilization.

The arrival of the Mughals in India dates from the defeat by Babur of Ibrahim Lodi at the battle of Panipat in 1526. This victory enabled Babur to claim the Delhi Sultanate. Babur consolidated his position by a second victory over the Hindu rulers at Khanua in 1527 and only after this was he able to survey his new kingdom and its contents. Little remains of Babur's building projects, although he is known to have employed 680 masons on one building at Agra alone, and to have laid out at least one garden, the Ram Bagh at the fort in Agra. Much of the time he lived in tents like his Central Asian ancestors. He was succeeded by his son, Humayan in 1530, but as he was in exile from 1540 to 1555 and died in 1556, Humayan had little opportunity to build, although his brother

Kamran built an extensive palace in Lahore on the banks of the Ravi.

Early Mughal works are mosques and tombs for favoured persons, such as the Jamali Kamali Masjid and tomb (1528-36) and the tomb of Adham Khan, c.1562. From Humayan's reign remain the ruins of the Purana Qila, the old fort, begun as the first Mughal capital city, the sixth of the seven Islamic Delhis. A mosque (1541) and a three-storey octagonal pavilion known as the Sher Mandal survive from this period. Due to his sudden death, Humayan was unable to plan his tomb during his own lifetime, which was the Mughal tradition. Instead it was commissioned and built in the 1560s by his senior widow, Haji Begum, who employed an architect, Mirak Mirza Ghiyas specially brought from Persia for the purpose. Standing in the centre of a garden, it was to become the first in the series of great Mughal tombs and buildings. The design combines elements from 15th-century Delhi tombs of the Sayyid and Lodi sultans on a new and massive scale. An elaborate geometric structure is complemented by decorative surface decoration on the façades, emphasized by the use of three different colour stones. William Finch, an English merchant, visited it in 1611 and described the building as "spread with rich carpets ... a rich semiane (coloured tent) over head". Other Mughal buildings, typical of the early period of Mughal architecture, stand in the same garden.

Such was the wealth of the state during this period that monumental building programmes could be undertaken and completed. Palace complexes in Delhi, Agra, Fatepur Sikri, Allahabad and Lahore were built by the Mughals in the late 16th and 17th centuries. These complexes included gardens and pleasure and hunting pavilions.

The Jahangir Mahal, in the Agra Fort, was built in 1570 by Akbar and is the only palace apartment which survives from his time. He was also, however, responsible for building work in the forts at Allahabad and Lahore, in the fort and palace at Ajmer, and in his summer palace at Mandu on an elevated plateau in central India, as well as his masterpiece, Fatepur Sikri near Jaipur, where he was able to put his philosophical, religious and architectural ideas into practice. Akbar began this palace complex in 1571, but he had abandoned it by 1585, when he transferred his capital to Lahore, and never returned. Water problems may have been a factor in its decline, but it is more likely that it was a result of Mughal architectural prodigality: a frontier slash-and-burn mentality that involved building magnificently and lavishly and then moving on when the building was found no longer suitable or convenient.

Jehangir built the Khamba pavilion at Nizamuddin, now part of New Delhi, in 1623. The small, white marble pavilion is seen as prefiguring the architecture of Shah Jarhan's reign and the Taj Mahal. Jehangir also made alterations to the fort in Lahore and is responsible for the Bari Khwabgah (sic), the large bedroom, among other interiors.

Shah Jahan (ruled 1638-48) was mainly responsible for the Red Fort in Delhi and also for interiors in the fort in Agra including the Khas Mahal and the Anguri Bagh garden and pavilion. He also commissioned the building of the Taj Mahal I (after 1631 to mid-17th century) one of the crowning achievements of Mughal architecture. Private domestic architecture was simpler than the royal complexes, although the arrangements were not dissimilar, but furnished on a lesser

India: column, Fatepur Sikri

scale. Furnishing was often minimal, with low thrones, or mattresses and bolsters brought in as required, and the rooms decorated with rare and precious textiles which were removed and stored when not required. This type of interior remained more or less the same until the widespread arrival of European manufactured goods by the beginning of the 19th century, and the increasing use of European-style furniture within India began to change the appearance of Indian interiors around the same time. Shah Jahan's buildings often included the use of semi-precious stones embedded into the walls, as in the Taj Mahal; others could not afford to copy this, but Rajput princes often used a similar but cheaper method of decoration, with multi-coloured glass inserts. Few domestic interiors of the 16th and 17th centuries are still extant, with the exception of some of the royal palaces mentioned above, and some in palaces in Rajasthan where even the rare 15th-century interior may remain, although much altered.

The enormous wealth of the Mughal emperors attracted craftsmen from many countries to the royal ateliers. The Mughal *karkhana* (workshops) were attached to the major centres of government such as Agra, Delhi and Lahore, and in them the artisans, goldsmiths, painters and weavers produced artifacts for the court. The craftsmen usually worked in family units, fathers passing on skills to their sons. Provincial centres followed the Mughal model, each workshop answering the need of a particular noble or ruler. Commercial centres also existed for particular products traded with the rest of India and exported to Iran, the Middle East and (with the increasing involvement of the European East India Companies) to the West.

The impetus was two-way trade; crafts also came from Europe during the Mughal period and influenced the work of the Mughal *karkhanas*. European royal gifts had a bearing on the Mughal style in painting and the decorative arts. A fusion of indigenous Indian and imported Iranian and European styles took place. A *Deposition from the Cross*, for example, copied by a Mughal artist in Lahore in about 1598 from a Flemish print, was made under the personal supervision of Prince Jehangir. The ceaseless flow of European artefacts to the Court, the strong Iranian cultural and political ties, and the arrival of European and Iranian artisans, who were taken into the emperor's workshops to join the Indian Hindu and Muslim craftsmen there, profoundly influenced the style and decoration of objects, and seems to have been responsible for the creation of entirely new industries.

In India the idea of art for art's sake was unknown until the Mughal emperors. Courts, temples and export markets to east and west motivated Indian art, as well as the everyday needs of its population.

The stability that developed during Akbar's reign, from 1556 onwards, and the attendant wealth generated, allowed him to encourage the manufacture in the royal workshops of copies of artefacts that appealed to him, things that came from abroad, or for which there was a demand. Court-patronized crafts were unparalleled; architects, builders and craftsmen were brought to Mughal cities not only from all over India but also from other parts of Asia. Due to political disturbances in Italy in the 16th century, Italian architects worked in many other parts of the world, seeking royal or imperial patronage. In France, Portugal, England, in the Spanish West Indies and

Goa, knowledge of Renaissance architecture and design, even if not widespread or long lasting, arrived in this manner. Italian and Portuguese architects were working in Goa from the mid-16th century onwards, and European artisans may also have travelled inland to the Mughal court.

Government-sponsored design workshops – an idea not developed in Europe until Louis XIV in the 17th century at Versailles – produced combinations of indigenous Indian and traditional Islamic designs. Specialised designers conceived each work of art, causing for the first time in India a separation between the craftsman and his inspiration, an emphasis on the individual versus the anonymous. Pile carpets, wall hangings, floor coverings, tent-panels, ivory and mother-of-pearl inlay on wood were some of the items introduced or improved under Akbar's court workshops.

In 1592 the English had captured a large Portuguese ship the *Madre de Dios* and had found it to contain a cargo of incredible wealth, including porcelain, jewels, spices, silks, calicos, carpets, quilts and dyes. The size of this prize encouraged English merchants to press for the formation of the English East India Company (established 1600) to open up the profitable trade to the east.

The Portuguese had been the first European colonisers to build extensively in India – in Goa – where Don Alfonso de Albuquerque created a thriving settlement with domestic, administrative and religious buildings from 1510 onwards. A previous Portuguese “factory” and settlement had been at Cochin in the south. Early buildings were wooden, fortified with palisades, but by the middle of the 16th century Daman, Diu and Bassein contained many stone buildings, chief among which was the Basilica of Bom Jesus in Old Goa.

Goa contained many religious buildings, both convents and monasteries. The Portuguese had assigned responsibility for the conversion of the Goans to Christianity to European-based monastic orders, such as the Franciscans and later the Jesuits, so the design of Goa's churches followed contemporary European styles. Most were built at the cusp of the late-Renaissance / early-Baroque style. The most important – Bom Jesus – was built by the Jesuits between 1594 and 1605 in a style derived from Vignola's Gesu church in Rome. Bom Jesus and other churches were designed for preaching, and similar façades, with superimposed classical pedimented fronts, can be seen throughout the parts of the colonial world where the Jesuit order was established.

Almost all Goa's churches have Baroque interiors with gilded altarpieces. Paintings on wood were usually by local artists, many assisted by Italians, whereas those few that were painted on canvas were imported from Europe. Wooden statues were the norm, as western India is largely forested, although some imported stone statues do exist.

Domestic architecture also followed Portuguese precedents. The Indo-Portuguese aristocracy developed a version of the Portuguese town house and plantation house adapted for a tropical climate, and this style was repeated throughout Portugal's colonies. The officially encouraged policy of inter-marriage with local people also meant that an Indo-Portuguese style of domestic architecture developed in their colonies from quite early on. By contrast, the “factories” of the Dutch, English, French and Danish colonisers in India in the early period were institutional, almost male-only enclaves and had

little architectural influence on their surroundings. It was not until the 18th century, when the journey became less costly and the political situation more secure, that more women began to travel to India and an indigenous European domestic architecture began to develop in and around the enclaves of the colonists.

Danish, Dutch, French and English settlements followed the Portuguese. The Dutch already had a fort at Cochin, where the Dutch palace existed from the 16th century. A Jewish synagogue there had existed from very early on, and was decorated with blue and white export tiles brought from China in the 18th century.

In Surat, the Portuguese, Dutch (1616), British (1612) and French (1668) erected factories; long, low, defensive buildings, facing inwards onto courtyards, acting both as dwellings and warehouses. Built first in mud and brick, and later in more permanent materials, they provided communal living, as in a college or mess. None of these early European factories survive; they are known now only from drawings and engravings.

European colonisers had been able to establish footholds in India relatively easily as the arrival of the earliest settlers actually pre-dated that of the Mughals. The Portuguese had established themselves on the west coast of India in the 1490s, while the first Mughal emperor arrived in 1526. To the local Indian population the regime of one foreigner appeared little different from that of another. The European colonists might even have seemed preferable as, initially, they were interested only in establishing trading relations, while the Mughals actively sought to impose political and possibly religious hegemony over the subcontinent.

Early in the 16th century merchants of the Portuguese East India Company, already established at Goa, began to look to Bengal in eastern India, motivated by commercial and religious considerations. In 1536, after many attempts, they gained a foothold, setting up trading posts at Satgaon and Chittagong and controlling the customs houses there. They gradually ousted the Arabs from their key position in the eastern sea trade and the period of European dominance began. In the 16th and 17th centuries a three-way trade existed, with textiles from the Indian subcontinent being used as barter for spices from South East Asia. Europeans had to break into the textile market if they were to procure the spices which were their main prize. The most favoured commodity demanded in exchange for textiles at Dacca, the capital of Bengal, was gold and silver bullion, giving the Bengali merchants the ability to trade with the rest of the subcontinent with a freedom they had not known before.

The Portuguese, who had established the trading post at Hooghly in the 16th century, were mainly interested in richly embroidered backstitched quilts, bed-hangings made in and around Satgaon, the old mercantile capital of Bengal on the banks of the river Saraswati. These were used in Europe as bed-covers, highly prized in England as well as in Portugal. (The earliest reference to Bengal quilts is recorded in 1618 in the English records of the East India Company, but the Frenchman, Pyard de Laval, visited Bengal in 1607 and described the embroideries there). The Portuguese were them-

selves often represented on the embroideries, as well as in temple reliefs, as an exotic motif.

In 1632 the increasingly hostile relations between the Portuguese and their Arab hosts culminated in the siege and fall of the Portuguese settlement at Hooghly. Thereafter Portuguese influence and power in Asia declined and their role was taken over by other Europeans, anxious to avail themselves of India's merchandise. Nevertheless, the Portuguese never entirely disappeared from Bengal, where their descendants are still found, having intermarried with the local population.

Little furniture was used in India before the arrival of the European colonisers, with the exception of the *charpai* or *charpoi*, the archetypal Indian bed. The Portuguese in the 16th century were the earliest colonisers to use Indian artisans, and the carvers of wood and ivory who embellished temples and palaces now diversified to provide items for the Portuguese Asian export market, such as portable communion tables and church furnishings. These would be decorated with Christian motifs and subsidiary Indian designs and are known to have existed from the 1580s.

Portuguese-designed furniture was hardwood with inlaid Mughal decoration. Ivory caskets were produced in Sri Lanka for dispatch to Portugal as diplomatic gifts – these, and Communion tables, are the earliest datable examples of Indo-Portuguese furniture design. Furniture was assembled in Goa from different production centres in India, including Sind, Gujerat and the Deccan, for shipment to Europe. Both the Portuguese and later the Dutch took part in this trade.

Ebony was prized for its hardness, durability and grain, taking a brilliant polish and providing a dark, lustrous background for applied decoration in ivory and bone. Rattan, or cane, first appeared in the Indo-Dutch export trade furniture in the 17th century and within a generation was known all over Europe. Indian-made furniture continued to be almost solely for the European market until the 18th century, when increasing numbers of European settlers created a demand for furniture for the home, as opposed to the export market. Local craftsmen re-interpreted models from imported pattern books.

The English and the French rapidly expanded their ports along both coasts during the 17th century. With these new ports came an increased demand for goods. As pre-industrial India was still 90 per cent rural, it was largely the village farmers and craftsmen who supplied the market. Indian wares flooded European shops and warehouses, creating fashions in design and changing styles in every field. Textiles were among the most important exports: chintz, calico, gingham, muslin, silk, satin, velvet and brocade as well as quilts, embroideries and carpets. For three hundred years a steady flow of Indian fabrics exported to Europe increased in popularity and demand.

In the latter part of the 17th century in Europe the fashion was for complete sets of Indian hangings, in chintz, embroidery, or a combination of both techniques. These sets were almost certainly entirely designed for the export market and might comprise wallhangings, bed-curtains with valances and coverlet, perhaps matching chair and cushion covers and small carpets to surround the bed. Some purchasers were content to acquire only a coverlet, or chintz yardage to line a small room, such as was bought by Samuel Pepys in 1663 and mentioned

in his diary. The attraction of these Indian chintzes lay in the brilliance and fastness of their colours and the fineness of their designs, and such was their popularity that Louis XIV banned their sale in France in the late 17th century. As a result, textile workers set up in Provence, which was a separate administrative area until the French Revolution. Various enterprises began reproducing the fabrics in Nîmes, Tarascon and Marseille, calling them “indiennes” after their country of origin, the name by which they are still known in France, although in England they are called Provençal prints.

In textile design Gujerat and Bengal were the main bulk producers and suppliers, and had the sites from which transportation overseas was easiest. *Kanthas* from Bengal were also produced commercially for export, with biblical scenes for a foreign clientele and double-headed eagles for Spain in the 16th century. Bengal embroideries were exported from very early times. Tome Pires in his *Suma Oriental* states that as early as 1515 the exports from Bengal included “very rich and beautiful bed canopies of cut-cloth work [appliqué] in all colours, and wall hangings like tapestry”, and they formed part of the royal household in Portugal by 1570.

Printed cottons from India were known in England in the 16th century or earlier. The word calico, which means painted cotton cloth, entered the English dictionary in 1540 and the word chintz, derived from *chitt*, in 1614.

During the 17th and 18th centuries foreign travellers witnessed the wealth and prosperity of Dacca, and its flourishing commerce based on the production of cotton goods. Gradually the East India Company set up an extensive system of procurement. It took two years before orders for selected samples or “musters” at different factories could reach London for the two major sales in March and September. Decisions of the Court of Directors in East India House were communicated to remote weaving centres in the Subah of Bengal through the Governor General and Council at Fort William in Calcutta and its factories. By the mid-18th century every town and almost every village had its looms worked on a joint-family basis. Medium grade cloths of all types provided the bulk of the piece-goods exported to Europe.

The finest silks and muslins (plain, figured in the loom, or needle embroidered) were reserved for the Mughal courts of Delhi and later Murshidabad. These translucent muslins suited Muslim rulers, with their lavish tastes, and provided a desirable alternative to Qur’anic restrictions on the use of pure silk by men. Jamdani muslin was lavished with the best techniques and designs of the Persian masterweavers settled in India. In the period of the European Companies, the best Bengal muslins came from Dacca and Santipore. The *tasar* and other wild silk embroideries of Satgaon in Hooghly district had been a major export commodity in the age of Portuguese supremacy, but declined thereafter.

As trade became more highly competitive in the 18th century, the agents of the European companies and other private merchants farmed out their orders to weaving villages and tried to buy export orders in direct sales. Therefore by 1751 more direct supervision was considered necessary. The British introduced standardisation of the product for export to Europe, thereby dispensing with the outstanding quality possible in the limited quantities required for the royal courts.

Textile design in Bengal did not only consist of woven

muslins. At Dacca, *chipikars* or block printers printed cotton prayer shawls for Hindu rituals and shrouds for Muslim funerals, applied gold and silver leaf to wedding garments and printed the outlines for *khasida* embroideries. Indian textiles were not only woven and printed but also embroidered. Chamba *rumals*, Bengal *kanthas*, Punjab *phulkaris*, Kashmir shawls, Bihar *sujani* quilts are just some of the names that are widely known. In Bihar the appliqué technique for commercial purposes was mostly confined to canopies, tents and large walled enclosures, a form of decorative art which derived from the originally nomadic Mughals and could assume vast city proportions. Mughal tented encampments were extremely elaborate. They usually had two sets of tents, one of which was sent ahead to be set up. These were organized like small towns and each person had his allotted place. Jehangir’s quarters were a fort of painted wood and canvas 300 yards in diameter and included a harem and a mosque.

Historical and religious conditions applicable in Bengal (and differing from the rest of India), meant that the influences on the arts were different. At the beginning of the 18th century conditions at the Mughal capital, Delhi, were no longer conducive to the employment of artists, and the consequent dispersal of painters led to the establishment of a school of provincial Mughal painting in Bengal, at Murshidabad, which soon acquired distinctive characteristics of its own. Within the ambiance of the newly independent court, a demand for the trappings of aristocratic life resulted in the development of crafts, such as metalwork, ivory and textiles, in which the decorative motifs stemmed from Mughal, rather than local artistic traditions – although it is at the landlord and middle-class level that the distinctions between Hindu and Muslim cultural icons were most sharply made. However, during the 18th century particularly, Hindu rajas and zamindars involved with the Mughal court, adopted aspects of Persian culture in its Mughal forms. The transmission of visual form from the courtly to the village level again indicated the cohesion of the culture. Murshidabad also supported a flourishing school of ivory carving, which has a history in India dating back at least to the Mahabharata. During the colonial period this craft flourished wherever culture was high enough to support such luxuries. Ivory sheeted wooden caskets were among the early state and diplomatic gifts of the Portuguese period, some showing Christian scenes. Eastern India is known to have had an ivory carving tradition from at least the 10th century. It became important in the 18th century when Murshidabad was a major regional capital, with the decline of the Mughal powers in Delhi. The National Trust at Powis Castle in Wales has Lord Clive’s ivory and partly coloured chess set, made in Murshidabad in about 1760. The industry seems always to have been dependent on the level of local patronage; at the end of the 18th century the focus changed from Murshidabad, with the decline of the Nawabs’ court no longer the regional capital, to nearby Berhampore, an army cantonment town where the increased demand for ivory was from Europeans, as Fanny Parks noted when in Berhampore in 1836.

Sandalwood inlaid with bone and ivory was used in both furniture design and later for decorative chess sets. The two major centres of furniture-making at this time were Murshidabad in Bengal and Vizagapatam in south India, each close to an administrative centre of the East India Company

and both with traditions of ivory carving, veneering, and, in Madras, inlaying wood. Vizagapatam was a large and important furniture-making centre for elaborate and intricately inlaid furniture popular with European purchasers in the 18th century. In both these centres, local craftsmen, experienced in working for foreign markets, were known for their ability to work from “musters” (patterns), and to copy unfamiliar objects.

Indian furniture in the 18th century generally followed the styles of Chippendale and later Hepplewhite and Sheraton. In Bengal the ivory workers of the Murshidabad court produced ivory furniture strongly influenced by the Neo-Classical style. In Vizagapatam, furniture was either wood with ivory inlay, or was veneered with sheets of ivory on a wooden core. Ivory was decorated by incising a pattern and filling the depressions with black lac. The monochrome black, on work for Europeans, is probably due to the monochrome engravings they provided for the craftsmen to copy, or possibly due to less exuberant taste. Later examples of furniture, from Berhampore, are of ebony with ivory embellishments. The size and importance of the market in providing European-style furniture is demonstrated by the wealth of the Kat Gola complex near Murshidabad, a large early 19th century Neo-Classical mansion and grounds built on the profits from the making of European-style furniture.

★

In the 18th century the power of the centre in Delhi began to decline and various regional centres of influence and patronage developed. These included the states already carved out by the Rajputs and Marathas in western India, and the Muslim states of rulers such as the Nawab of Murshidabad in Bengal, the Nizam of Hyderabad in the Deccan, the Nawab of Arcot, and later Tippoo Sultan, in the South. The Rajput and Maratha states were traditional opponents to the Mughals in Delhi. The Muslim rulers on the other hand, had earlier been feudatories of the Mughals in Delhi but were able to set themselves up as rival power centres as conditions in the centre weakened. Conditions in the Mughal Court were no longer conducive to the kind of patronage required by artists and painters, and they moved to seek work and patronage elsewhere. A thriving school of Mughal-derived painting developed in Murshidabad. The Rajputs developed not only a style of painting but also an architecture in which a successful and aesthetic synthesis of Mughal and Hindu art became Rajput art. These regional styles originated in Delhi but mutated as they reached the provincial courts. Examples from this period in Rajasthan are the palaces of Kotah, Bundi and Dungapur, all with interiors of the period. In the South, Tippoo's winter palace in Bangalore was frescoed, as was his summer palace at Seringapatam, still extant but recently in need of repair, which was decorated with fresco murals of his victories.

An early example of planned city layout is the city of Jaipur. Jai Singh, the ruler of what would come to be known as Jaipur, abandoned his fortified rock palace of Amber in the early 18th century to lay out the new city in the 1720s. The grid plan was used, and although such high standards of town planning had been known two thousand years earlier (as evidenced by excavations at Mohenjo Daro, in present-day Pakistan), this is the first known major example in the recent historical era. Jai Singh may have had access to European books on architecture

known to have been circulating in India, and certainly one building in Jaipur of this period exists which has a very European façade to the street, with alternating triangular and segmental pediments to the windows. Jai Singh also built the astronomical observatory at Jaipur, and another almost identical building exists in Delhi. To his reign dates the Diwan-i-Am and other interiors of the city palace in Jaipur. But, apart from these rare examples, architecture and design in India continued to follow oriental norms; domes on religious (Islamic) buildings incorporated squinches, arches were ogival, and labour was often seasonal.

At this period, although the activities of the French and British colonisers were becoming more evident in India, the connection between European and Indian thought on the matters of architecture and design was very much a matter for individual rulers and their tastes and interests. There was much greater interest in European astrological and navigating instruments, which were of a high standard and had always been much sought after. The ruler of Mandvi in western India financed a young man, Ram Singh, to go to England to learn various trades, such as watch-making, and he set up workshops on his return to India, various European technical crafts being practised in Mandvi during this period.

★

In addition to Bengal, colonisers had settled earlier in the south, around Madras and Tanjore where the major architectural and design influences were French and British. Unlike the parsimonious East India Company, the French state provided impressive residences for their governors in Pondicherry in the south and later in Bengal at Chandernagore. Thus the magnificent Baroque Government House in Pondicherry (founded 1674) which was commissioned by Dupleix, built in 1752 and destroyed by the British in 1761, was rebuilt in the Rococo style from 1766 onwards, while the governor's house in Chandernagore in Bengal was in the Neo-Classical style.

After the conquest of Pondicherry, the British led in matters architectural as well as in commerce. Although the French had built earlier in the 18th century, the major architectural contributions of the British began after 1750.

Calcutta had become the site of the East India Company factory in eastern India in 1690. The new Fort William was begun in 1758, after the Battle of Plassey. Bricklayers and carpenters recruited from England acted as instructors for local Indian labour. By 1780 Calcutta was known as a “city of palaces”, and the more settled existence necessitated a variety of different building types; churches, town halls, residences, tombs, monuments, official, legal and administrative buildings and a Mint went up rapidly in a Neo-Classical style mainly derived from the architectural books of James Gibbs, written much earlier in the century, and others. The administrative Writers Building existed by the 1780s. In 1794 the Government House, Council House, Accountant General's Office and Supreme Court had all been built, only to be replaced within ten years by even grander edifices.

Alongside official architecture, domestic building developed. Rich merchants' town houses, designed in the manner of Palladian town palaces, required 50 to 100 servants to function. Increased mercantile expansion allowed the inhabitants to live lavishly. Sophisticated country or garden houses flourished around the large cities from the middle of the 18th

India: interior in Impey household showing Lady Impey with her servants, c. 1780; watercolour by Shaykh Zain al-Din

century. Their design may have been influenced by the books of architecture of Andrea Palladio, or later James Gibbs and John Nash – with the addition of very wide verandas on the south side for shade, and *punkas* (cloth ceiling fans, aiding air circulation) – but the usual bungalows were more rustic. As the name suggests, they originated in Bengal but were also built in northern India and in the south, adapting to local conditions. In the beginning clay and thatch were used. These materials would be replaced later on by stone walls and roof tile; the character changing from *cutcha* (raw, unfinished, unripe) to *pukkha* (finished, ripe, complete).

Two gouaches painted c.1782 for Sir Elijah and Lady Impey show fashionable European interiors in Calcutta in the late 18th century. Sir Elijah Impey was Chief Justice of Bengal and the Impeys were important art collectors, connoisseurs and patrons. One interior shows Lady Impey in her bedroom, giving instructions to her household staff. The bed is tucked away in an alcove. The French windows are hung with fash-

ionable balloon shades, the floor is covered with a large patterned carpet with a distinctive border, the wheel-back chair set against the wall is in the style of Adam, the dressing table and its mirror are draped in the manner fashionable in England at the time (as shown in the portrait by Zoffany of Queen Charlotte with two of her children). The other interior shows the large nursery furnished much more sparsely. French windows lead from a semi-circular bay onto a veranda, the floor is covered with a simple striped *dhurrie* and the children's beds have posts at each corner to support the mosquito nets. The Impeys are among those families whose collections provide important documentary evidence in the history of European art in India, as are the collections of the Clive family, now at Powis Castle in Wales, or the works commissioned by Marquis Wellesley, Governor General from 1798 to 1805. Many European artists were also working in India at this period, including Chinnery who eventually moved to China and later died there. Devis and the Daniells are among the best

India: the Judges' bungalow, Madura, 19th century

known of the British artists, and a portrait by Reynolds remains still in Calcutta.

Architecture and design commissions remained in the hands of military engineers until the 1820s, when a course in civilian architecture was introduced. Previous to that, study of Belidor's *La Science des Ingénieurs* and consultation with patrons had been considered adequate training. This system had produced, for example, the new Government House, Calcutta (1799–1803) for Marquis Wellesley by Charles Wyatt, a member of the Bengal Engineers and one of the Wyatt architectural dynasty, who had been inspired by James Paine's project for Kedleston Hall in Derbyshire which had been published. John Garstin, also a Bengal Engineer, designed the circular storage *gola* (meaning round) at Bankipore in Bihar (1784–85) – as a means of preventing famine – and also the Calcutta Town Hall (1805–13).

Architecture and design also celebrated military successes, as with the circular temple of St. John in Calcutta, commemo-

rating the second Rohilla war. The Banqueting Hall at Madras built c.1803 for Lord Clive by the Danish-born astronomer and mathematician John Goldingham, remembered the Freedom of Amiens. In the same year the Neo-Classical British Residency at Hyderabad was begun by Samuel Russell of the Madras Engineers. Like the Government House, Calcutta, it was intended for extravagant state occasions. Elsewhere, at Lucknow, General Martin's yellow stucco palace-cum-tomb had no parallel in Europe; neither did Garstin's *gola*.

As British political power in India increased, Neo-Classicism became the preferred architectural style. It was fashionable in the mother country, and its adherents felt that it was well adapted for the tropical climate. Also, the overtones of classical antiquity suggested an association with imperial Greece and Rome which cannot have been absent from the minds of the colonisers and their architects.

By the end of the 18th century, smaller towns outside

Calcutta were developing. Barrackpore, the country seat of the Bengal governor, was a military cantonment. Officers usually lived in bungalows and soldiers in tents. This new urban pattern developed to meet the military's need for mobility and speed. Troops were located away from the old forts in permanent camps. Building was planned around a large open space, or *maidan* for gatherings and parades. Bankipore in Bihar, Meerut in northern India and Berhampore grew up in much the same way; a large brigade station with a very full European cemetery containing Neo-Classical tombs and monuments rivalling the Park Street cemetery in Calcutta. Nearby Murshidabad's European palace, with its Indian Neo-Classical interiors, was built on the river front by Bengal Engineers in Neo-Classical style between 1817–20.

From the 16th century onwards Italian architects were in service with the Portuguese in Goa, but the majority working in India were British and Irish. Tiretta, the East India Company's architect in Calcutta in the late 18th century, was an Italian architect. European architectural books circulated; the works of James Gibbs, James Paine, the Adam brothers and William Chambers were all known, as well as Leoni's editions of Alberti and Palladio, Vauban's plans for fortifications and the works of Vignola.

In the areas colonised by the British, many churches derived their plan from that of James Gibbs's St. Martin in the Fields, included in his 1728 *Book of Architecture*; these included St. Mary in Poona, (1825), St. John, and St. Andrew in Calcutta and St. George and St. Andrew in Madras. The latter church was designed after drawings by Thomas Fiott de Havilland and contained a memorial statue by John Flaxman. Catholic churches, especially in Goa, often followed the Baroque, Vignola-derived, style popular in southern Europe. Skinner's church in Delhi is in a more Northern Italianate, Tuscan style.

The Gothic style was rarely used at this period, except, in a very early example, at the garrison church at Fort William, Calcutta, in the late 18th century. St Paul's Cathedral (1829–47) in Calcutta, an early example of Victorian Gothic, has interesting stained glass by Sir Edward Burne-Jones, and is more or less the first example of the revival of this taste. Thereafter, however, Gothic was to become the official style.

Neo-Classicism dominated European architecture in India until the middle of the 19th century; Madras was the "Grecian city". The Greek Revival was introduced into the Presidency towns by William Nairn Forbes (Calcutta Mint) and Thomas Cowper (Town Hall, Bombay). Both had been inspired by Stuart and Revett's measured drawings of Greece – Forbes's Doric order on the Calcutta Mint derived from the Parthenon. The earlier generation of architects, Garstin (b.1756) and Wyatt (b.1758) were firmly rooted in the Palladian style, whereas Cowper (b.1780) and Forbes (b.1796) were Greek Revivalists, a more directly historic style. Many of those working in India in various capacities were Scots, and as Edinburgh was a city almost rebuilt in the Greek Revival style at the end of the 18th century, this doubtless influenced their choice. The change in emphasis occurred c.1820 simultaneously in India, Europe, Britain and the United States. The engineers in India worked in the same antique Grecian manner as their colleagues in Europe and the former "western colonies".

★

In the early 19th century, the artist Robert Home was

appointed Court Painter in Lucknow, and "school of Home" thrones, chairs and furniture designs flourished across northern India and survived, at least in Benares, until as late as 1880. Thrones however, normally maintained their traditional Indian shapes. Often octagonal, they were made as portable objects, to be used in camp as well as at court, the upper section lifting off the base.

The Victoria and Albert Museum possesses the famous Tipu's tiger, c.1795, the world's best known mechanical toy, made for Tipu Sahib, Sultan of Mysore, 1782–99. French artisans were employed in his court workshops, contributing to the renaissance of crafts Mysore enjoyed during his reign. Tiger motifs adorned most of Tipu's possessions. His cannon and mortars were cast in the form of tigers, and the covering over his tomb is the mock print of a tiger skin. The tiger head finial of rubies, diamonds and emeralds from his throne is at Powis Castle in Wales. It was given by Marquis Wellesley to Lord Clive's daughter-in-law, who had become a keen collector of material related to Tipu Sultan during her stay in India, searching out his relics immediately after the siege of Seringapatam in 1799. Indian princes had always understood the importance of the image and of "face", but Tipu Sultan was possibly the first Indian ruler to develop the use of a logo identifying his personal possessions as part of his cult of personality.

European influences had formed a small component of the imperial style of painting and decoration from the first half of the 17th century, but it was not until the 19th century that we find them affecting the manner and form, as distinct from the content, of the indigenous tradition. The Vizagapatam style of furniture and decoration in south India remained important until the end of the 18th century. Magnificent pieces, such as those commissioned by two generations of the Clive family and now in Powis Castle in Wales, were made there.

The Vizagapatam style fell out of favour in the 19th century when more middle-class Europeans began to come to India. This furniture was expensive, had to be commissioned to order and was also unable to stand up to the rigours of the constant moves necessitated by the frequent transfer of administrators and officials around the country. Important officials who had arrived in the 18th century lived in style and commissioned furniture to take back to Europe on their return. The early 19th century watershed saw the arrival of administrators without capital, who bought their furniture at auction when they arrived in India and sold it when they left. Interiors and furnishings became more bourgeois. Furniture began to adapt to the needs of the middle classes, often becoming portable and usually finished in a simpler manner with a black Indian shellac finish known as French polish. Indians in the large urban areas, and particularly in British India, now also began to use more furniture, usually following English styles. Department stores and furniture companies also developed in British India, in Calcutta, Bombay and Madras, to cater for the needs of more middle-class British administrators. In the early part of the century designs were based on the English Regency style, while in the mid-century they followed the mid-Victorian Rococo Revival style.

Travelling furniture, pieces bound with brass corners and edges to prevent damage, was popular. The reclining armchair with swivelling or sliding footrest section and caned seat was also developed at this time. Beds had reeded, turned tapering

legs, bulbous reeded supports (for mosquito curtains) and spindled railings.

In the early 19th century, Lord Wellesley's new, grand Government House was built in Calcutta and it is known later to have contained a large suite of furniture, made in India, in the French Regence Revival style, a style which had been popularised by Wellesley in the interiors of his London residence Apsley House – which he later sold to the Duke of Wellington. Some of this furniture is still in the Government House, Calcutta and some is in a private collection in London. The visit of Edward, Prince of Wales to India in 1876 necessitated the purchase of a suite of Louis XVI chairs from Paris for the Government House, Calcutta. Some of these are also now in the same London private collection.

By the late 19th century, furniture manufacturing and retailing shops existed in major cities such as Calcutta, where the firm of Lazarus and Tomlin produced Rococo Revival furniture to order. Calcutta's Whiteway and Laidlaw department store provided movable "campaign" style furniture for those out of town. These pieces could be easily dismantled and moved about from place to place. Furnishings were also available by mail-order from catalogues for those administrators in "up-country" bungalows. Their differing needs gave rise to a particular style of life, with gardens arranged with plants in pots, for easy transportation to the next posting, and readily transported furniture.

Design and architecture for the urban middle classes became much more important in the 19th century. Nineteenth-century households in India had much of the clutter of a Victorian home in England. For the Indian wealthy, there was lavish display including, for the aristocracy, even glass and crystal furniture in certain instances. Much of this was manufactured in Belgium and transported to India, and a suite is still extant at the palace in Udaipur. Particularly in Bombay and Calcutta, some sections of society became so prosperous that they commissioned and influenced design. In Bombay the Parsis were an immensely wealthy and influential community originally from Persia, as were the Marwaris, originally from Rajasthan. The Marwaris had made their fortunes in Calcutta, but retained homes in their ancestral districts of Mewar and Shekawati in Rajasthan, incorporating large traditional house complexes called *haveli*, often elaborately frescoed inside and out, with frescoes based on Indian and European themes.

British successes in the early part of the 19th century meant that territorial jurisdiction now extended into the first range of the Himalayas, at a height of about 7,000–8,000 feet. The government began to develop "hill stations" in these regions, with their alpine-type climate, as recuperation centres for British soldiers in India, and they later developed into summer resorts. The hill station bungalow developed as an alpine adaptation of the plains bungalow, similarly furnished with simple interiors. Later the development of the railway system meant that the whole machinery of government could be transferred from Calcutta, the capital, to Simla the summer capital, for eight months of the year. An enormous summer residence for the Viceroy, and others almost as large for important officials such as the governors of the states and the Chief of the Army Staff, were constructed there in timber and brick in the Elizabethan or Jacobean Revival style popular at the end of the 19th century. Suburban Surrey was recreated 8,000 feet up in

the Himalayas, with interiors typical of the "English country house" of the end of the century.

Although the arrival of the railways had made the annual move to the hills easier, this peregrination had been an annual event from the 1830s when the annexation of these territories had taken place. The British had continued the Mughal tradition of moving through the country in tented encampments. Emily Eden wrote about her brother's period as Governor General in India in the 1830s; the retinue housed in his tented encampment numbered some 12,000 persons. The use of tented encampments continued to be important throughout the 19th century, culminating in the Coronation Durbar of 1911, when all the Indian Princes and King George and Queen Mary were housed in an enormous tented encampment at the site of what was to become New Delhi.

The impact of Indian design in Britain, which was particularly strong in the second half of the 19th century, was complex, creating new markets and in turn affecting design in India. But ultimately, and perhaps inevitably, increased demand led to a decline in standards.

Benefiting from Cornwallis's permanent land settlement of 1790, which increased the revenue of land-owners, the landed aristocracy, the rajas and the zamindars devoted their new prosperity to the cultivation of European tastes by furnishing their palaces in what they took to be the style of the colonial mansions erected for the East India Company's merchants and officials. Even Bengal's major goddess, Durga, was housed under a Regency style portico with Corinthian columns, such was the influence of European design. Hindu religious ceremonies increased in grandeur after the establishment of British rule and landowners lavished much larger sums on ceremony than before. The Hindu gentry and rural aristocracy derived their status and importance from conspicuous consumption and by religious philanthropy; they still do so today in certain areas.

By the 1870s people were fearing deterioration in quality, loss of artistic integrity and the destruction of traditional modes of production in the decorative arts in India. George Birdwood, Professor of Medical Science and founder of the Victoria and Albert Museum, Bombay, talked about this at the Paris Universal Exhibition in 1878: "Indian collections are now also ... [becoming] ... more overcrowded with mongrel articles, the result of the influences on Indian art of English society, missionary schools, schools of art, and international exhibitions and, above all, of the irresistible energy of the mechanical productiveness of Manchester and Birmingham, and Paris and Vienna". Birdwood had a romantic image of the Indian craftsman living in a democratic village community working with simple tools in his own home. His anxiety about the dangers of market exploitation and official encouragement of industrial development in India was identical to that of contemporary design critics and the leaders of the Arts and Crafts movement in England. India came to represent an ideal artisan society which had long disappeared in Europe. The importance of these arguments was not lost on the Nationalist leaders in India. A few decades later the same ideas were used effectively in the *swadeshi* (home industry) campaigns of 1905–10 and further elaborated by Mahatma Gandhi in the 1920s and 1930s.

Following their introduction in England, Schools of Art

were established in Madras, Bombay and Calcutta in the 1850s and in Lahore in 1875. The British debate about the purpose of Art Schools – whether as training grounds for artisans or institutions providing a generalized artistic education – had an added complexity in India. Their practical purpose was to provide a new generation with useful and employable skills in the industrial and ornamental arts – a vocational training for those in the expanding middle classes who were unable to undertake a literary or scientific education. During the 1870s and 1880s there was much debate on the state of Indian crafts. In Calcutta there were token attempts to support a few surviving traditional art industries, but there was also a new emphasis on training in the techniques of Western academic art.

Indian art schools were doomed from the start because of the conflicting ideological imperatives which had brought them into existence. Their failure to recruit artisans – who could afford neither the time nor the fees – encouraged students with a taste for European academic art, and they became the purview of the gentry. The Calcutta Art School, for example, was a haven for unemployed graduates. By the end of the 19th century, the Calcutta Art School had also become associated with the developing Nationalist movement. E.B. Havell, the Director from 1896 to 1906, an ardent critic of British policy on the arts, encouraged the study of India's own fine art traditions and supported the painter Abanindranath Tagore's development of a new "Indian style" of painting.

In Lahore, Lockwood Kipling (1837–1911) took charge of the new Mayo School of Craftsmen, helped to set up the influential *Journal of Indian Arts and Industry*, and worked with the American designer Lockwood de Forest to promote the export of Indian design. Kipling was the Municipal Architect of Bombay and Curator of the Lahore Museum from its inception in 1875 to 1893. He had trained as an artist in London and was closely associated with English art circles – his sister-in-law was married to Edward Burne-Jones. Kipling was instrumental in bringing English mid-Victorian sensibilities to India and, later, a knowledge of the Arts and Crafts movement. He realised the importance of craftsmanship and India's enormous design heritage, and almost single-handedly revived the craft of the stonemason in Bombay. He also designed and installed, with the help of Indian artisans, an Indian billiard room for the Duke of Connaught at Bagshot Park, Surrey, and a dining room for Queen Victoria at Osborne House on the Isle of Wight, as well as the Durbar room at Elvedon House in Suffolk for the Maharaja of the Punjab.

In the 19th century many of the Indian princes used their energies and revenues to build large new palaces in European styles, using British architects, such as Sir Swinton Jacob, among whose other works is the Art Museum in Jaipur. Udaipur and Mysore are examples of 19th-century palace complexes which show the influence of European taste, as do several of the Palaces of the Nizam in Hyderabad.

By the end of the century, Indian princes had also come to emulate the fashions and lifestyles of their British overlords. Factory-made fabrics from distant Europe displaced traditional textiles. Men's headwear and garments became more uniform. Some Indian rulers took to wearing western clothes. Under the British umbrella, myriad communities had moved to the new cities of Calcutta, Kanpur, Bombay and Madras. The ease of the journey to India, with the opening up of the Suez Canal,

meant that a flood of Europeans travelled out to India to seek work, particularly Scottish and Irish nannies, raising generations of the aristocratic and the wealthy in India, burdening them with nicknames such as Baby and Bubbles and leaving them with a taste for Europe, including copies of French châteaux and Italian villas. The architecture the British left throughout the subcontinent is a testimony to their presence, but their cultural impact remained limited, and it is easy to overestimate the extent to which the mass of Indian art or society was influenced by the West before 1947. After the decline in arts and crafts in the late 19th century, a revival took place in the earlier part of the 20th century, helped in part by the artistic aspect of the Bengal Renaissance, and later by the political counterpart to this.

The Coronation Durbar of 1911 was the catalyst for the decision to build a seventh Delhi – New Delhi – moving the capital from Calcutta, which was felt to be too far from the centre of the country. Sir Edwin Lutyens, along with Sir Herbert Baker, was commissioned to design and develop the new capital, a project which occupied him until the 1930s. Lutyens had long been looking for a grand project where he could develop his ideas on classicism. The most important domestic building of the complex is the Viceroy's Lodge, now known as the Rashtrapati Bhavan, and the official residence of the President of the Republic. Lutyens studied many examples of Indian architecture and combined them successfully, synthesising the English Baroque Revival style of the early part of the century with elements from Hindu architecture. It was furnished in the Edwardian Country House style, mixing European antiques and decorations with caned *bergère* suites of furniture. Lutyens was closely involved with all the interior planning, even down to designing some of the chandeliers in the children's bedrooms himself.

"Lutyens Baroque" was the official British style of the 1920s and 1930s, but Art Deco was preferred by avant-garde collectors and Rajput princes, and unlike in Europe, the style did not suddenly end at the outbreak of World War II, but lingered on into the late 1940s and early 1950s. Its popularity was enhanced by the fact that it was perceived initially as a non-British style whose origins derived from non-European sources. This was an important consideration for independent rulers living in a society where the coloniser was omnipresent, even if not officially recognised as being so.

During the period following the end of World War I, many Indian princes became assiduous travellers to Europe – especially France where Art Deco originated – and purchased numerous items of furniture and objects in the Art Deco style to be shipped out to India. Several palaces were built in the Art Deco style and examples in both Jaipur and Jodhpur have Art Deco interiors, as well as some in the smaller states such as Orcha and Dungapur. Jodhpur has the Umald Bhavan palace, built between 1929 and 1940, which was the largest private residence in the world, with Art Deco furnishings, interiors and murals by the Polish artist Stephan Norblin. The Maharaja of Morvi also built a new palace in this style. Art Deco buildings were still being put up in Calcutta into the 1950s. Also exceptional is the Bauhaus palace of the Maharaja of Indore built in the 1930s by a German architect with Bauhaus / moderne interiors featuring furniture by Jacques-Emile Ruhlmann, Le Corbusier, Louis Sognot, Eileen Gray and others.

India: Durbar Hall, Viceroy's House, New Delhi, by Edwin Lutyens and Herbert Baker, 1931

Art Deco, "Lutyens Baroque", and much Victorian clutter, lingered on into the late 1940s and even into the early 1950s, in Calcutta. The Modern Movement was significant in India only after World War II. An attempt in the 1930s to introduce the Modern style into India by the architect Walter Burley Griffin proved abortive. But in the post-war period, French influences became important – Le Corbusier was invited to plan and build the new capital of the Punjab at Chandigarh from 1951 – as did Scandinavian design. Modernist furniture, copied by Indian carpenters, was derived from "Scandinavian modern" models, American design magazines and British "Festival of Britain" period furniture. These trends lingered on well into the 1970s.

One of the leading figures of the Bengal Renaissance, Rabindranath Tagore, the poet and Nobel Prize laureate, established a craft programme to increase interest in Indian design at Santiniketan, his country estate in Birbhum District in Bengal which he turned into a university. Within the university at Santiniketan, he established a Craft Department. Kala Bhavana was the College of Fine Arts and Silpa Bhavana the Hall of Industries or crafts. At the beginning a graphic art and craft workshop, Vichitra Studio, was set up at Kala Bhavana, where teachers and students learned and practised various decorative arts and crafts such as alpana, lacquer work, calico painting, batik work, bookbinding and illumination, also wood-engraving and mural decoration. As these so-called "craft" activities were always overshadowed by the art programme, they were eventually moved to Silpa Bhavana in Sriniketan, a sister campus related to rural development, education and organization.

Rabindranath Tagore at one time had a keen desire to build a craft-based educational system in Sriniketan, based on the "Sloyd" system in Sweden. Staff were sent to Sweden to study the system and in 1934 and 1935 two Swedish weavers came and taught at Santiniketan and Sriniketan. The 1933 catalogue mentions the products available: *dhurries*, carpets and curtains, for which they also took orders, as well as for upholstery. These designs and items were non-traditional, catering for the needs of the newly-educated upper- and middle-class consumers wanting indigenous, as opposed to foreign, manufactured items.

The Silpa Bhavana products were very influential in India in the 1930s and 1940s among the educated elite. Their Art Nouveau flavour managed to reconcile East with West, art with craft, and personal creativity with mass production. Decline and stagnation took hold in Silpa Bhavana in the late 1940s and early 1950s after Tagore's death. Tastes had changed, and by then the movement had outlived its context. It was overtaken by the concerted effort, in the 1950s, of the newly independent government to re-equip the traditional handicraft sector to meet new demand. Traditional units were more resourceful in making quality products and had greater technical range. The Indian public wanted simpler, less ornamental and more functional design.

In the late 1950s, the Government of India invited the American designers Charles and Ray Eames to recommend a programme of design training as an aid to small industries. Out of this grew the National Institute of Design, founded in Ahmedabad in 1961, designed to function as "an autonomous

national institution for research, service and training in industrial design and visual communication".

In the late 1950s, the American architect Edward Durrell Stone (1903–78) designed the new American embassy in Delhi (1954–58), where he combined American Modernism with elements from Mughal architecture, surrounding the building with pierced Mughal screens. By the 1970s, however, a much more confident generation of architects and designers had grown up in India who had never been confined within the strait-jacket of colonialism. Notable among them are Charles Correa, architect of the Cidade de Goa in Goa, and Laurie Baker, the British-born Trivandrum-based architect. Both Correa and Baker have attempted to tackle the perennial Indian problem of finding a solution to the widespread lack of affordable middle-class housing.

Indian architects and sculptors, such as Satish Gujral, have also designed embassies in Delhi, and hotel design has become important with the growth of tourism. Significant among the new hotel interiors are the redecoration of the new wing of the Taj in Bombay, by the Hong Kong-based designer Dale Keller (who has since built the new palace for the Sultan of Brunei), and the interiors of the Intercontinental Hotel in New Delhi 1951–58, by Durga Bajpai and Piloo Mody.

Whereas in Europe and America one of the reactions to Modernism had been the Postmodern classically influenced style, the new generation of architects and designers in India has returned to its ethnic roots; low divans, stools and other types of furniture referring to Indian history now fill New Delhi colonial bungalows and exist cheek-by-jowl in Bombay high-rise apartments with shiny chrome and glass furniture.

The large amounts of money pouring back into India from Indians working overseas has also influenced styles in architecture and design as has the upsurge in numbers of the vast new urban middle class, estimated at some 150–200 million people, whose buying power is beginning to count. Several new or recently founded design magazines in Delhi and Bombay disseminate the work of leading architects and designers and shape the taste of this newly prosperous class. However, as far as the general level of taste is concerned, the stage of development in design resembles the situation which existed in western Europe after World War II and which continued well into the 1950s, when many things were in short supply and most people made do with whatever was available.

Inglennooks

The inglenook is an ubiquitous feature of the late Victorian and Edwardian interior. Serving both decorative and practical functions, these built-in fireside seating areas had antecedents in the interiors of the 16th and 17th centuries. Inglenooks appear in drawing rooms, dining rooms and halls in both Britain and the United States. They are a feature of Richard Norman Shaw's "Old English" and "Queen Anne" styles, the American Shingle Style and were particularly important within the context of the Arts and Crafts movement on both sides of the Atlantic.

Although the use of seat furniture immediately adjacent to the fire had a precedent in the fireside positioning of benches and settles in the great halls of manor houses of the 16th and 17th centuries, it was in fact with the Arts and Crafts movement that the inglenook lost its purely practical aspect and became an integral part of contemporary interior schemes. The incorporation of the inglenook into late Victorian and Edwardian plans for domestic housing came about for both logistical and emotional reasons. Often central to the plan of the Arts and Crafts house, the inglenook can also be viewed as the psychological heart of the home. Equally, it provides a microcosmic view of many of the connotations and associations of the movement's philosophy for interior decorative schemes.

The Arts and Crafts movement had gathered pace in England in the 1880s and had been given its impetus by a number of designers, architects and theorists key among whom were William Morris and John Ruskin. The movement's practitioners sought to provide an alternative to the harshness of life in 19th-century Britain. A central tenet of the Arts and Crafts designer's creed was to ameliorate ordinary people's lives, bringing greater harmony into their living and working conditions through an improvement both of the work process itself and of its products. Indicting the machine age as being responsible for both the loss of personal freedom and poor standards of design, Arts and Crafts advocates paradoxically saw the way forward in a return to the practice of craftsmanship along the lines of the medieval guild system. In this way, the close identification of a way of life with the creation of objects and buildings and their interiors meant that the movement became very largely focused on the domestic. It is against this background that the key significance of the inglenook to contemporary schemes should be viewed.

Perhaps one of the finest examples of an Arts and Crafts inglenook is the one in the Great Parlour at Wightwick Manor near Wolverhampton (1897). Here the fireplace and surround dominate one wall, and form a typical alcove with built-in seating. As happens elsewhere, the Wightwick parlour inglenook provides a secluded seating area and makes a neat enclave in an otherwise vast gallery.

Of all the Arts and Crafts architects to incorporate inglenooks in their schemes, it was H.M. Baillie Scott who really championed their use. Baillie Scott advocated using plain brickwork hearths, simple fire-baskets and oak settles in the inglenook's alcove. His work reflected the desire to build according to a simplified but idealised version of the traditional country manorhouse. His schemes, in which the fireplace is usually of central importance illustrated the cherished

Inglenook in a house in Rugby, designed by Barry Parker; photograph c.1904

belief that not only the comfort but the aesthetic charm of a room depended on the situation and appearance of the fireside area.

In addition to its dominance in the interior of the typical Arts and Crafts scheme, the inglenook fireplace was often of indirect importance to the exterior of such houses. Richard Norman Shaw's "Old English" style typified by Cragside, built during the 1880s near Newcastle, combines a fusion of styles and uses very imposing Tudor chimney stacks to give the house something of a quaint manorial feel. Here it seems that the exaggerated height of the chimneys signifies the most important element of the rooms indoors.

In Britain, the Queen Anne and in the United States, the Shingle styles also referred to an architectural past and reflected it in the use of large open fireplaces in drawing rooms, dining rooms and libraries. In such schemes, wooden chimneypieces with shelves displaying plates and pottery were built into large recesses which were made to accommodate oak benches or settles on either side of the fire.

The incorporation of discrete seating areas provided by inglenooks in interiors in both Britain and the United States, paradoxically goes hand in hand with one of the innovative aspects of late 19th- and early 20th-century interiors: the use of open-plan design. Within interiors of this kind, the inglenook fits perfectly as it allows for privacy, and the much sought after Arts and Crafts quality – cosiness – without

compromising the fluidity of the large open room. The British architects Parker and Unwin even went as far as commenting that, "if your big room is to be comfortable, it must have recesses" (Kaplan, 1989).

The inglenook's central status in the Arts and Crafts interior reveals the extent to which the twin notions of hearth and home have remained as deeply entrenched emotional issues within attitudes towards the domestic environment and its culture. Above all, its popularity as an integral part of late 19th- and early 20th-century interior schemes points to the importance of addressing questions of symbolism and meaning when evaluating any aspect of design relating closely to personal life.

Intarsia

The term intarsia causes some confusion as it is derived from the Italian word which refers to all kinds of inlay (including marquetry). It is accepted that intarsia is a particular form of decoration for furniture and architectural panels that is distinct from other types of wood decoration, including inlay, certosina and marquetry. It is, in fact, an inlay process which builds up a pictorial design by setting timber pieces 3mm to 6mm thick into recesses cut into a solid ground. The process was intended to provide colour by using stained or shaded timbers set against a dark background.

Generally, intarsia incorporates *trompe-l'oeil* perspective designs, often using humanistic motifs such as books, globes, and other trappings of Renaissance learning. Motifs also included architectural perspectives of imaginary buildings, both complete and in ruins, and it was these that could be found in both furniture and architectural woodwork.

Intarsia appears to have originated in Siena in the 14th century and was initially used for the decoration of religious buildings. The first recorded use was in the choir stalls of Orvieto Cathedral. This was the work of Giovanni Ammannati who died c.1340. Later examples can be found in the chapel of the Palazzo Pubblico Siena executed by Domenico di Niccolo de Cori (1415-28). The process matured in Florence and was at one time considered equal to painting. Giorgio Vasari in his *Lives of the Artists* gives details of artists who worked in the medium and credits Francesco di Giovanni as the originator of the process. He also notes that Brunelleschi taught perspective to artists by using intarsia examples.

The religious use of intarsia continued and both the choir stalls of Siena Cathedral (1503) and the doors of Raphael's Stanze in the Vatican (1514-21) are examples of this continuing church patronage. Both were executed by Fra Giovanni da Verona of whose work Vasari comments: "Fra Giovanni executed not only the surrounding panelling, but also some very fine doors and chairs, with perspective studies, which won him generous praise and rewards from the Pope". Although this work was planned to complement Raphael's paintings, designs might be supplied by contemporary painters. It is known that Piero della Francesca provided designs for the

intarsia work in the Sacristy of Modena Cathedral, while Lorenzo Lotto designed the intarsia screen for the church of Sta. Maria Maggiore at Bergamo.

Apart from the religious applications of intarsia it was also used in secular decoration, for cabinets and *cassoni*, but also for decorating interior wall panelling. Perhaps the most famous use in a domestic room was the decoration of the Studiolo of Federigo da Montefeltro, in the Ducal Palace at Urbino. Constructed c.1470 and still *in situ*, the small room is enlivened by amazingly skilled intarsia decoration. The *trompe-l'oeil* effect is achieved by creating the illusion of half-open cupboards with their contents tantalizingly on display, shelves with lifelike objects and architectural detail which is featured all round the room. A similar example by Francesco di Giorgio for the Palazzo Gubbio is now located in the Metropolitan Museum of Art in New York.

In Italy, by the mid-16th century intarsia was moving out of high fashion and gradually became a craft rather than the high art it had once been. Work in hard-stones replaced the supremacy of wood.

The strong influence of Italy meant that intarsia became attractive to South German cabinet-makers. The high quality intarsia work from Augsburg and Nuremberg was evidence of their expertise in the field. The famous Wrangelschrank made in Augsburg during 1566 is a fine example of the cabinet-maker's skill. Unlike much of the Italian work preceding it, the designs were Mannerist, incorporating strapwork, animals, and birds, within an imaginary architectural ruin. Intarsia can often be found on the back and top as well as the front and sides of a cabinet, clearly an indication of prestige.

More typical is the example of the cabinet dated 1561, made by the Master HS, which demonstrates a close connection with the Italian tradition. Three central panels are decorated with an inlaid design, based upon architectural perspective. Renaissance designs were being produced in Germany for use by craftsmen, such as those by Peter Flötner. The Augsburg intarsia workers often used the printed designs of the type produced by Lorenz Stör, who published woodcut designs in his *Geometria et Perspectiva* in 1567.

As in Italy, intarsia was also occasionally used for panelling. An example is the panelled room from the Schloss Haldenstein, in Switzerland, which is now in the Kunstgewerbe Museum in Berlin. This has a deep frieze ornamented with inlaid architectural scenes.

From Germany the influence of intarsia decoration spread further north. Towards the end of the 16th century, parts of the Low Countries had developed the skills to use intarsia work, particularly Zeeland and Antwerp, both using the imaginary architectural scene to decorate the fronts of cupboards and chests. In England, the well-known Nonsuch chests were made up from a form of intarsia, and often incorporated architectural scenes in their front panels. With the development of the marquetry process, which was much more adaptable, intarsia became redundant.

Intarsia should not be confused with the Islamic-influenced process of certosina. This is a 15th-century Italian inlay process which uses wood, metal, bone, and shell, cut into small polygons and arranged geometrically on a surface.

Interior Design, history and development

Before the 20th century the profession of "interior decorator" or "interior designer" did not exist. Interiors would exceptionally be designed by architects but more usually by tradesmen such as the cabinet-maker, upholsterer or retailer. Key examples include Waring and Gillow or Lenygon and Morant, who specialised in buying and selling antiques, rather than interior design specifically. It was during the early years of the 20th century that the profession of interior decorator emerged, to be superseded by that of interior designer in the post-war era.

The role of interior decorator has traditionally been a feminine one, of adviser and confidante working from natural instinct rather than professional training. Before World War I

Interior Design: the London drawing room of Mrs. David Bruce, decorated by John Fowler

interior decoration was established as an acceptable way for women to earn a living. The decorator was responsible for the selection of suitable floor- and wall-coverings, furniture, furnishings, lighting and overall colour-scheme for pre-existing rooms. The decorator would not undertake structural alterations which were the responsibility of an architect. Interior decoration has never shared the status of architecture or interior design, being regarded as a lowly branch of fashion. This is due to the ephemeral nature of much of the work and the fact that the profession was dominated by women in its early days.

During the 19th century decorating the home was regarded as an acceptable past-time for the middle-class married woman, and women played a major part in the Arts and Crafts movement. The translation of this traditional role into a profession began in America, where women were less restricted by social convention. Candace Wheeler, founder of the Society of Decorative Art of New York City and of Associated Artists, encouraged women to enter the world of interior decoration in her article "Interior Decoration as a Profession for Women" in the Christian magazine, *The Outlook* in 1895. Interior decoration achieved greater status in 1897 when novelist Edith Wharton and architect Ogden Codman published *The*

Decoration of Houses, which established a standard criteria for judging "good taste". Such good taste consisted of any French, English or Italian architecture from the Renaissance to the 18th century, with a particular emphasis on the latter. Codman and Wharton also worked as interior decorators in New York, emphasising the qualities of harmony and good proportion in their work. This inspired Elsie de Wolfe, another pioneer of interior decoration in America. She practised in New York from 1897 onwards, decorating the Colony Club and Henry Clay Frick's private apartments on Fifth Avenue. She travelled to Europe frequently to obtain antiques for her clients, mingled socially with them and adhered to Codman and Wharton's dictates about classical proportion and the desirability of 18th-century French furniture.

During the inter-war years a group of professional interior decorators emerged in America and Britain to enjoy great success. Among them were Nancy McClelland, Eleanor Brown (McMillen) and Ruby Ross Wood in America and Betty Joel in Britain. Joel used mainly Art Deco and Moderne furniture and effects in her commercial interiors. The two women who were to contribute most towards the development of interior decoration as a profession in Britain, Syrie Maugham and Lady Sybil Colefax, worked largely on commissions for the decora-

tion of private houses. After her marriage to the novelist Somerset Maugham failed, Syrie Maugham trained in the antique department at Fortnum and Mason's before establishing her own business in the late 1920s. Her most distinctive and influential interior was the "All White" room she created for her London home in c.1929–30. Actually decorated in tones of cream and beige, the room featured a large Moderne mirror screen, a Marion Dorn abstract rug and off-white, Louis XV chairs. In contrast, the work of her rival Lady Sybil Colefax was inspired by the English Country House look. Heavy chintzes and solid furniture were a feature of the Colefax interior from 1933 onwards. In 1938 she formed a business partnership with John Fowler, an expert in 18th-century decoration and influential figure in the world of authentic, period decor. Fowler was chief adviser for the National Trust's restoration of Syon House, Middlesex and Wilton House, Wiltshire during the post-war years. Schemes such as these were featured in British and foreign periodicals throughout Fowler's long career, contributing to the popularity of the English country house look from the 1930s onwards. Interior decoration therefore acquired the reputation for accurately restoring or recreating past styles.

While past styles provided an important source of inspiration for many interior decorators, that of Surrealism also played an important role in the 1930s. For example, France's leading interior decorator Jean-Michel Frank designed the Cinema Ballroom for Baron Roland de l'Épée using a startling colour scheme. The carpet was bright red and each of the four walls had a separate colour – pink, pale blue, sea-green and yellow. The theatre-boxes were draped with purple velvet framing the ultimate Surrealist seating, Salvador Dalí's *Mae West Lips* sofa of c.1936. The sofa was based on his painting, *Mae West* (1934). British versions were commissioned by the foremost collector of Surrealist art, Edward James, for Monkton House near Chichester, and an example is housed in Brighton Museum. In America interior decorators such as Dorothy Draper and Rose Cumming were also influenced by Surrealism.

By the 1930s the profession of interior decoration was well established in America, with the American Institute of Interior Decorators (now the American Society of Interior Designers) founded in 1931 and trade journals launched. *Home Furnishing* was established in 1929 and *The Decorators' Digest* in 1932. More men now worked as interior decorators, some of whom had received some formal training and adopted a more commercial approach. Terence Harold Robsjohn-Gibbings had been trained as an architect and was brought to America by Charles Duveen, the antique dealer and brother of the art dealer Joseph Duveen. Robsjohn-Gibbings set up in practice on Madison Avenue, New York City in 1936 and undertook commissions for California jeweller Paul Flato in a mixture of Scandinavian modern and period styles. The rise in status of the interior decorator was interrupted by World War II, and the subsequent shortages of materials. By the 1950s the emergence of interior design as professional practice challenged the hegemony of interior decoration. Key interior decorators to emerge during the post-war years include David Hicks in Britain and Albert Hadley in America. Hadley was an admirer of the work of Eleanor Brown and joined McMillen Inc. in 1956. In 1962 Hadley joined Mrs. Henry Parish II as a

partner, and the firm of Parish-Hadley undertook many commissions to restore or recreate period interiors throughout the 1960s and 1970s.

While post-war interior decorators catered for the wealthy client in the creation of luxurious, domestic surroundings frequently with a period flavour, a new breed of architects undertook interior designer commissions for commercial and modern interiors. For the first time in the history of design, America was now at the forefront in terms of stylistic leadership. While Modernism had originated in Europe during the 1920s and 1930s, the migration of émigrés to the US during the war and the official American encouragement of Modernism established their cultural leadership. Much interior design work executed during the 1950s and 1960s in America was the work of architects. For example, the architectural practice of Skidmore, Owings and Merrill (SOM) designed one of the most important post-war office buildings – Lever House, New York in 1950–52 complete with open-plan offices. SOM became established as world leaders of the contract interior market, that is, interiors designed for commercial as opposed to domestic purposes. Offices designed by SOM for the Chase Manhattan Bank, Pepsi Cola and the Connecticut General Life Insurance Company under the direction of Davis Allen were classically modern in style. In terms of domestic interiors, architect-designer Alexander Girard designed the Rieveschel house in Grosse Pointe, Michigan in 1952 with Corbusian ramps and built-in furniture to create a fluid interior space. Much use was made of natural light while fur rugs and plants served to blur the distinction between interior and exterior as a key modern architect, Philip Johnson, had done with his Glass House in New Canaan, designed in 1949.

The American modern style had an enormous influence throughout Europe by means of film, television and magazines as did the concept of the architect-designed interior. For example, in London the Architects Co-Partnership designed a house in 1956 bearing all the hallmarks of the modern style: built-in furniture and storage, a scattering of free-standing lamps and the integration of indoors and out with a sliding glass door leading to a balcony. This style was established by architects trained in the International Style, the classical Modernism of the 1930s. The interior designer was yet to emerge, even though other design areas were receiving recognition, for example, commercial artists were now graphic designers. The transformation of interior decoration into interior design was marked with the changing titles of societies and journals. For example, the Incorporated Institute of British Decorators, founded in 1899 added "and Interior Designers" to its title in 1953 and were eventually to drop "Decorator" altogether in 1976 to become the British Institute of Interior Design. During 1987 it merged with the Chartered Society of Designers. Across the Atlantic the American Institute of Interior Decorators was founded in 1931 and transmuted into the American Society for Interior Designers during the 1970s. Journals followed a similar trend with the American periodical *Interior Design and Decoration*, founded in 1937, becoming simply *Interior Design* during the 1950s. In 1940 *The Interior Decorator* became *Interiors*. A further indication of the emergence of interior design as a profession can be found in the extent of training provided. In Britain by 1968 five art colleges ran diploma courses in interior design and the Royal College

of Art had created a department of Interior Design. In America the Fashion Institute of Technology, New York introduced a course for interior designers in 1951. By the 1970s most American colleges offered courses in interior design.

In terms of professional practice in Britain, interior design played an important part in the 1980s retail boom. Fitch and Co. were responsible for the design of the interiors of Top Shop and Top Man at Oxford Circus, London during the 1970s and Midland banks and Debenhams during the 1980s. Fitch were important in terms of the development of interior design as they were specialists in this field, rather than architects who also designed interiors. In 1985 British design turnover was over one billion pounds, with interior design contributing 35 per cent of the business. Interior design had become an important part of the corporate identity of any company, whether it be a retail chain or a building society. The questioning of international modern architecture during the same era also put more emphasis on interior design. With the impact of Postmodern design from the mid-1970s onwards and the more recent experiments of Deconstructivism, interior design formed an exciting showcase for such developments. For example, the work of British designer Nigel Coates exemplifies the verve of recent interior design. His Metropole restaurant in Tokyo of 1986 combined elements of the London gentlemen's club, classical columns and *trompe-l'oeil* paintings to create an exhilarating interior. Interior design is now a well-established profession, enjoying a distinct identity from architecture in the commercial sector.

Ireland

Interior design in Ireland may be summed up in the overall relaxed informality of the arrangement of rooms and a love of excess of ornamentation, particularly in plasterwork during the 18th century. If there is such a thing as an Irish style it is essentially a country house one, and it is in the rural parts of Ireland that survivals of the unique characteristics of interior design may be found both in the vernacular interiors of the country cottage or farmhouse and in the great country houses.

As a result of its unsettled history – marked out by rebellion, civil war, famine and more recently, the destruction caused by greater affluence – few domestic interiors in Ireland have survived intact with their original decorative schemes and contents or with the accumulation of objects and styles from succeeding generations. The number of houses of any significance that have descended in the same family with their contents intact may be counted on the fingers of two hands. The surviving interiors date from after 1700 and are generally to be found in buildings of the 18th century. The period of peace that followed the Battle of the Boyne in 1690 brought about a spate of house building after the destruction that marred the previous centuries and the relative prosperity of the 18th century allowed for more lavish decoration to be undertaken. The professional training of designers and craftsmen in drawing at the Dublin Society's School, established in 1746, contributed to the improvement in standards of design and decoration.

Specifically regional elements are found in the vernacular country cottage and farmhouse interiors. The rudimentary cabins and cottages constructed along traditional lines form a continuous history from earliest times well into the 20th century. The interiors were sparsely furnished, partly due to poverty but also because since the 16th century there has been a shortage of native timber. Locally available alternatives were used in the construction of cabins, such as turf (peat), clay or wattle and daub with roofs thatched in straw, reeds or flax. The interiors of these long, low houses, usually one room deep, were whitewashed and the floors were earthen or of a mixture of pebbles and flagstones. The hearth was the functional centre of the house around which the seating was arranged often with stone hob seats and built-in benches. The most inventive aspect of these interiors was the way the furniture formed an integral part of the construction of the interior: two pieces of furniture such as a cupboard and dresser acted as a room divider or were literally built-in as part of a partition wall. A door could be placed in between to create a separate room. This room was usually a bedroom but in the 19th century modest farmhouses were extended to include a parlour in imitation of the houses of the gentry. Another common feature was the bed alcove situated close to the hearth and curtained off.

The interiors of many cottages were painted in dark brown, green, ox blood or black halfway up the wall and whitewashed above. The larger pieces of furniture, dressers and settles, were always painted, stained or grained and often painted in contrasting bright colours.

The most important surviving interiors from before 1600 are at Malahide Castle, Co. Dublin, which contains a 15th-century medieval great hall in its original form which continued to be used as a dining room. Although re-roofed and partly

Ireland: wooden staircase from Eyrecourt Castle, Co. Galway, c.1660

altered in the 19th century, the dimensions of the hall, the vaulted undercroft and carved corbel heads are original. In the medieval core of the castle is the Oak Room with walls covered in carved and stained oak paneling with strapwork decoration, scenes from the Old Testament, and a Flemish carving of the Coronation of the Virgin. Carrick-on-Suir Castle, Co. Tipperary built c.1568 contains a brightly lit long gallery on the *piano nobile*. The plasterwork ceiling is decorated with geometrical strapwork and the frieze contains an iconographic scheme that demonstrates the loyalty of the 10th Earl of Ormonde to Queen Elizabeth I. The portrait of Elizabeth is placed in a roundel between fluted pilasters and is flanked by personifications of Equity and Law that are set in niches on either side. The gallery is dominated by a limestone chimneypiece that breaks the frieze and has an elaborately carved overmantel that displays the Ormonde arms. Originally the walls were covered in tapestries that may have been woven in Kilkenny where the 8th Earl of Ormonde established a manufactory employing Flemish weavers.

The construction of Portumna Castle, Co. Galway, now a ruin, in 1618 marks the arrival in Ireland of more fully-fledged Italian Renaissance decoration. The gateway is in the form of a classical triumphal arch and the doorcase is decorated with strapwork and obelisks. However, these advances were interrupted by the political upheavals of the 17th century. The most significant event took place in 1662 when the Duke of Ormonde was made Viceroy; his patronage ensured that the classical style was established in the great public building schemes he undertook, but similar developments in domestic architecture would have to wait.

After 1700 house building took on a new importance in Ireland. The strength of Dutch influence, after the triumph of William of Orange in 1690, may be seen in both urban and country houses. Sash windows were introduced at this time and high-pitched gable-roofed houses with wainscoting and corner chimneypieces decorated with blue and white Delft tiles were commonplace in Dublin. Only a few of these interiors survive with such early chimneypieces and paneling; the best preserved example is 48 Montpelier Hill.

The most important interiors of the early 18th century are at Beaulieu, Co. Louth, which combines a mixture of medieval, Dutch and English classical influences as well as rare painted ceilings. The great central two-storey hall is a descendant of the medieval hall. This contains a large chimneypiece with overmantel incorporating a topographical view of Drogheda. The triumphal arch theme is suggested by the arched central doorway which is flanked by wooden Corinthian pilasters and decorated with carved timber trophies, musical instruments and coats of arms. The drawing room, dining room and study are wainscoted throughout with bolection-moulded paneling. The drawing room ceiling is compartmented with garlands of flowers and leaves framing an oval central panel that contains a *trompe-l'oeil* view of a Baroque colonnade with urns in niches and a cloudy sky with flying putti in the manner of Antonio Verrio (1639–1707).

Dutch influence was quickly supplanted and the building of Castletown, Co. Kildare, which began in 1722, represents a definitive shift to Italianate taste. Castletown remains the largest house in Ireland, its interior design and decoration took up most of the 18th century and any discussion of taste or inte-

rior decoration in Ireland is dominated by its overwhelming influence. The architectural shell of the house was designed along palazzo lines by the Italian Alessandro Galilei (1691–1737) for William Conolly (1662–1729), the Speaker of the Irish House of Commons. Conolly wanted Castletown to show off his wealth and status but also to be a patriotic expression of national pride. Bishop Berkeley (1685–1753) was influential in the design and planning of the interiors and he may have suggested the inclusion of the long gallery. In a letter to Berkeley, Sir John Perceval (d.1748) refers to the design and decoration of Castletown: "... recommend to him the making use of all the marbles he can get of the production of Ireland for his chimneys, for since this house will be the finest Ireland ever saw, and by your description fit for a Prince ... I would examine the several woods there for inlaying my floors, and wainscot with our own oak, and walnut; my stone stairs should be of black palmer's stone, and my buffet adorned with the choicest shells our strands afford. I would even carry my zeal to things of art: my hangings, bed, cabinets and other furniture should be Irish, and the very silver that ornament my locks and grates should be the produce of our mines" (M. Craig and others, *Country Life*, 1969, p.724–25).

The hall was designed by Sir Edward Lovett Pearce (d.1733) who visited Italy and studied the writings of Palladio. (Pearce's annotated copy of the *Quattro libri dell'architettura* still exists.) The entrance hall at Castletown is articulated with Ionic columns on the ground floor and an idiosyncratic Corinthian order in the form of tapering pilasters with carved wooden capitals of baskets of flowers and fruit at gallery level. The gallery has a delicate wrought-iron balustrade and the plasterwork on the coved ceiling with bold Greek key pattern is reminiscent of earlier 17th century work. Documentary evidence and paint scrapes indicate that the hall has always been painted white. Thus there is a spectacular contrast with the polished black limestone chimneypiece and black and white chequered floor. The entrance hall of Pearce's fully executed Palladian villa at Bellamont Forest, Co. Cavan, contains busts of Roman emperors set in *oculi*; here Pearce repeats the Greek key pattern in the coved ceiling.

Richard Castle (c.1690–1751) came to Ireland from Hesse-Cassel in 1728 and worked for Pearce on the Parliament House, Dublin. After Pearce's death Castle dominated Irish country house architecture and he was commissioned to design most of the significant interiors of the 18th century including Westport, Co. Mayo; Carton, Co. Kildare; Powerscourt, Co. Wicklow (interiors destroyed); Russborough, Co. Wicklow; and Leinster House, Dublin. The interiors at Russborough are the best preserved and an impression of their original arrangement may be established since much of the contents of the house, notably the furniture and pictures, were donated to the National Gallery of Ireland in the Milltown Bequest.

Russborough was built in 1741; the state rooms (hall, saloon and music room) have lavish late Baroque stucco ceilings that are largely the work of the Lafranchini brothers, stuccodores from Ticino who worked in Ireland for most of their careers. Paolo (1695–1770) and Filippo Lafranchini (1702–79) worked with Richard Castle at Carton; Summerhill, Co. Meath; and 85 St. Stephen's Green, Dublin. They probably worked with other foreign or Irish craftsmen, as the stylistic variations in the decoration at Russborough are great, ranging

Ireland: Saloon, Carton, Co. Kildare, 1739–45

from the controlled and balanced Lafranchini work in the saloon to the overwhelmingly crowded plasterwork on the staircase which must have been the work of their studio. The lavish plasterwork spills over the cornices and down the walls. In the drawing room the elaborate plaster cartouches were executed to frame four seascapes by Claude-Joseph Vernet (1714–89). Each room (except the dining room) has a four foot high mahogany dado which acted as a backdrop for the heavily carved mahogany furniture and gilded mirrors that were originally designed for the house. Dark San Domingo mahogany is

used lavishly throughout the house in the doorcases, staircase and geometrically patterned floors which are unusual in Ireland. The hall has a polished black limestone chimneypiece, an established feature of the hall of an Irish country house. The walls of the saloon are covered with mid-19th century Genoese cut velvet which survived in the house and was conserved under the direction of Lady Beit in the 1950s. In the saloon the chimneypiece flanked by terms with a panel showing Androcles and the lion was carved in London by Thomas Carter the younger (similar to one at Uppark, Sussex); the

inlaid marble mantelpiece in the boudoir is by Pietro Bossi who worked in Dublin. The scale of the interiors decreases dramatically on the first floor. In comparison with the robust proportions below there is a doll's house quality upstairs with superb details in the paneling, doorcases and chimneypieces.

Only the ceiling of the saloon and the Chinese room at Carton, Co. Kildare remain as they were in the 18th century. The interiors were remodeled by Richard Castle in 1739 and in that year the Lafranchini executed the stucco work in the saloon depicting the *The Loves of the Gods*. The engraved sources for this ceiling and its connections with the saloon ceiling at 85 St. Stephen's Green, Dublin, also by Castle and the Lafranchini are fully described in Joseph McDonnell's *Irish Eighteenth-Century Stuccowork and its European Sources* (1991). The florid Lafranchini plasterwork decoration soon gave way to the Rococo of Robert West (d.1790) whose best work is in the staircase hall of his own house 20 Lower Dominick Street, Dublin and at 86 St. Stephen's Green. Michael Stapleton (fl.1770–1801) was the most important Irish Neo-Classical stuccodore of the late 18th century. Working in the style of Robert Adam, Stapleton created delicate interiors covered in finely detailed plasterwork on the ceilings and walls using moulds and freehand work. He repeated the designs in several rooms, for example in the Wedgwood room at Lucan House, Co. Dublin and 17 St. Stephen's Green and at Powerscourt House both in Dublin. Robert Adam (1728–92) designed the interiors for Headfort, Co. Meath in 1771; the coloured drawings for these interiors are in the collection of the Yale Center for British Art.

The interiors created by Emily, Duchess of Leinster (1731–1814) at Carton and her sister Lady Louisa Conolly (1743–1821) at Castletown are among the most important surviving interiors of their type. In 1759 Emily purchased some hand-painted Chinese paper depicting scenes of everyday life and landscapes. The large panels were framed on the walls with borders made in a Chinoiserie design and the smaller panels were cut out in irregular shapes and arranged around the borders. A carved and gilded Chinoiserie fillet frames the wall below the cornice and above the dado. The gilded Rococo overmantel is sumptuously carved with tiny brackets that would originally have carried Chinese jars, snuff bottles or figurines frames the chimneypieces. One of the most delightful interiors in Ireland is to be found in the park at Carton. During the 1760s, the Duchess of Leinster created a *cottage orné* with a shell room in the style of the one at Goodwood, Sussex. The walls, coved ceiling and central lantern are decorated in patterns of shells, with coral and shells suspended from the rafters. Mirrored glass is set into the walls and there is a rocky grotto.

Lady Louisa Conolly was inspired by her older sister in the decoration of Castletown. For instance, each designed and made a print room and each employed the Lafranchini stuccodores. In 1759 the Lafranchini were employed to decorate the staircase hall at Castletown with family portraits, masks representing the four seasons and Vesta (the goddess of the hearth), as well as grotesque heads, Chinese dragons, cornucopias and shells, symbolic of the four elements. Paintings were set into plasterwork frames. The cantilevered Portland stone staircase was built under the direction of Simon Vierpyl (c.1725–1811) and the brass banisters that contrast with the

white stucco ornamentation were made by A. King of Dublin in 1760. In 1768 Lady Louisa set about creating a print room using favourite prints and decorative borders. This remains one of the most elaborate print rooms to have survived without alteration since the 18th century.

The state rooms at Castletown were redecorated in a rigid Neo-Classical style to designs attributed to Sir William Chambers (1723–96). The dining room and drawing rooms contain compartmented ceilings, chimneypieces and door cases in the manner of Chambers. The cabinet-maker Richard Cranfield (1713–1809) carved the pier glasses in the dining room in the form of fruiting vines appropriate in a room presided over by Bacchus. The Dublin firm of Thomas Jackson were responsible for much of the rest of the carving and gilding in the house. The remaining state rooms form an *enfilade* comprising saloon, drawing room, closets and state bedroom. The red drawing room contains a set of Chinese Chippendale seat furniture that was made in Dublin and pier glasses in the style of Chambers. 18th and early 19th century textile wall coverings have rarely survived *in situ* but in this room the walls are covered in red French damask that dates from the 1830s.

The long gallery was redecorated in the Pompeian style under the direction of Lady Louisa Conolly in the mid-1770s. It was to be used as an informal drawing room. The gallery is illuminated by three Venetian glass chandeliers and four exceptionally large sheets of French mirrored glass. The room was originally filled with furniture, commodes by Pierre Langlois, tables by John Linnell, bookcases (now at Barons Court, Co. Tyrone), a billiard table and musical instruments. The walls and fields of the ceiling are painted lavender blue, with gilded cornice and frieze against a red background. Charles Reuben Riley (c.1752–98) and Thomas Ryder (1746–1810) carried out the decorative painting. They covered the walls with Raphaelesque grotesque decoration and the twin themes of love and marriage are celebrated in the murals which derive from engravings in d'Hancarville's *Antiquités Etrusques, Grèques et Romaines* (1766–67) and Montfaucon's *L'antiquités expliquée et représentée en figures* (1719). Painted interiors were not unusual, and some survive in Dublin town houses in Fitzwilliam Square and Merrion Square (notably no.49) and at Lyons, Co. Kildare, which was painted with Claudian landscapes by Gaspare Gabrielli (fl.1803–1833) in 1806.

Sir William Chambers's designs for Lord Charlemont's Marino Casino were published in his *Treatise on Civil Architecture* (1759) and executed by Simon Vierpyl. Nothing of the original furniture, pictures or contents survive at the Casino. The interiors suffered severe damage during the early part of this century and the chimneypieces were removed. The quality of the plasterwork and joinery that remains is outstanding and gives some indication of what must have been perfect early Neo-Classical interiors. The hall takes the form of an atrium in a Roman villa. It originally housed marble sculpture and is appropriately painted white. The hall compensates for its small scale by the use of receding coffering in the semi-circular apse that gives an illusion of depth, as does the detailed plasterwork on the ceiling and frieze. The plasterwork throughout the main interiors is filled with classical references. The theme of Apollo representing the arts, and his attribute the lyre may be found in details of the stone carving on the exte-

Ireland: Long Gallery, decorated in the Pompeian style, Castletown, Co. Kildare, 1770s

rior and in the plasterwork inside. The lyre dominates the central panel of the compartmented ceiling in the hall, along with Mercury's caduceus. The frieze is decorated with garlands of flowers and musical instruments, both symbols of festivity. The saloon continues the Apollo theme with his mask in a sunburst against a blue background in the centre of a white coved ceiling. The original blue and white colour scheme in the saloon has been restored. Extensive paint scrapes were carried out at the Casino and documentary evidence is extant for the interiors in the Charlemont Manuscripts (Royal Irish Academy), making the Casino one of the best documented buildings of the 18th century.

In the 1790s James Wyatt (1746–1823) created the grandest Neo-Classical interiors in Ireland at Castle Coole, Co. Fermanagh. The interiors are remarkable for the quality of the joinery, and the plasterwork and the textiles are outstanding. That they have survived in such good condition is a tribute to the tradition of rigorous housekeeping now continued by the National Trust. John Preston (fl.1807–25), the finest Dublin upholsterer, supplied elaborate curtains with intricate borders, fringes and tassels, suites of gilded furniture in Greek Revival

style and a magnificent State Bed hung with scarlet silk curtains. Joseph Rose (1745–99) executed the plasterwork and there are six chimneypieces by Richard Westmacott (1747–1808).

Two other interiors have survived virtually intact from the 1820s. The drawing room at Newbridge, Co. Dublin, contains the furniture and curtains made by the Dublin firm of Mack, Williams and Gibton in 1828 and the collection of pictures is arranged as it was in the 1830s. At Killadoon, Co. Kildare the drawing room retains its 1820s French green and gold wallpaper, original red curtains, flounces and gilt pelmets.

Sir Richard Morrison (1767–1849) and the stuccodore James Talbot (fl.1802–1808) excelled in decorative plasterwork. Morrison and his son William Vitruvius Morrison (1794–1838) created opulent Regency interiors at Ballyfin, Co. Laois, Baronscourt, Co. Tyrone and Borris House, Co. Carlow with richly encrusted coved ceilings and screens of *scagliola* columns. The dining room at Carton, Co. Kildare and the entrance hall at Fota, Co. Cork demonstrate their mastery of interior spaces.

At Lismore Castle, Co. Waterford, part of the interior deco-

Ireland: Red Drawing Room, Newbridge, Co. Dublin, early 19th century

ration was designed by the Gothic Revivalist A.W.N. Pugin (1812–52) and the work was carried out by J.G. Crace (1809–89) in 1850. The Banqueting Hall has an ecclesiastical air with choir stalls, perpendicular Gothic windows and stained glass. The walls and timbers of the open roof are richly stenciled. Pugin and Crace also worked on the Great Hall at Adare, Co. Limerick.

Humewood, Co. Wicklow was designed by William White (1825–1900) in 1866. It contains the most virtuoso Gothic

Revival interiors surviving in Ireland. The staircase hall is dominated by a pair of polished black marble columns and heraldic stained glass, however the rooms are relatively small in scale and the ceilings were painted by an Italian artist Grispini. Humewood was finished by James Brooks (1825–1901) the church architect who adapted his French 13th-century Gothic to domestic use in the design of the banqueting hall. The paneling and the ironwork in the gun room anticipates later Arts and Crafts developments.

The mid-19th century was dominated by the influence of Ruskinian Gothic and the work of Sir Thomas Deane (1792[-1871] and Benjamin Woodward (1816-61) who formed a partnership in Cork in 1851. Ruskin greatly approved of their work with its Byzantine Revival vocabulary and for the freedom they gave to their stone carvers, Charles Harrison (1835-1903) and the O'Shea brothers (fl. 1846-64). The great staircase of the Kildare Street Club was destroyed in 1971 and Woodward's achievement in domestic architecture may be fully appreciated at Clontra, Co. Dublin. In 1862 the interiors were decorated by John Hungerford Pollen (1820-1902) in a series of Pre-Raphaelite fresco cycles. Above the internal staircase a knight in armour and his lady drink a stirrup cup. The *Seven Ages of Woman* decorate the end walls of the drawing room and in the dining room frescoes depict *Spring Morning* and *Autumn Evening*. The timber construction of the high-pitched roofs is left exposed and the space between the rafters is decorated with birds, flora and fauna. On the walls is Celtic interlace, probably the earliest use of this Celtic Revival motif in an interior scheme.

The Arts and Crafts Movement in Ireland had a rich life, notably in enameling, stained glass and ecclesiastical interiors. Domestic interiors such as those at Belle Isle, Co. Fermanagh and on a modest scale at Baytown Park, Co. Meath with exposed beams, paneling and stained glass are rare.

Sir Edwin Lutyens (1869-1944) remodeled interiors at Howth Castle, Co. Dublin, adding a library with oak paneling and bookcases. He created a series of romantic vaulted interiors at Lambay Castle, Co. Dublin, using pale grey limestone and contrasting white rendered walls.

Iveagh House, Dublin contains some of the finest neo-Rococo and Italianate interiors of the late 19th century. The staircase was designed by J.F. Fuller (1835-1924) and the decoration of the walls in Algerian onyx, alabaster and marble in the staircase hall and ballroom are to designs by William Young (1843-1900).

Eclectic late-Victorian and Edwardian taste is reflected in the work carried out by Dublin firms of professional decorators and house fitters that flourished at the turn of the century. Many of these firms survived into the 1960s and 1970s reproducing a variety of neo-Georgian and neo-Rococo interiors. The largest firm of decorators was Millar and Beatty Ltd., with branches in Grafton Street, Dublin and in Londonderry, where they employed more cabinet-makers and upholsterers than any other firm. They specialized in reproducing French Rococo Revival, Sheraton and Chippendale style interiors and reproduction furniture. In 1905 they advertised a range of interiors in *The House Beautiful*; one in the "New Art" style comprised of imported American mass-produced furniture and fittings as well as Donegal and Cork (Youghal) carpets and linoleums in Art Nouveau patterns. Millar and Beatty designed an interior for the Irish section at the St. Louis Exhibition in 1904.

Maguire and Gatchell were decorators, lighting specialists and suppliers of bathroom fittings (their work is perfectly preserved at Killineer House, Co. Louth). They also sold jewel safes and strongrooms at their showrooms in Dawson Street, Dublin and were pioneers in modern forms of central heating.

H. Sibthorpe & Sons' early work included fitting out the Kildare Street Club (c.1860) in robust plaster friezes and corbelled beams. They are more usually associated with the

variations of Rococo such as their own "Marie Antoinette style" and Louis Seize decoration. Sibthorpe provided the more popular neo-Adamesque that fitted in with existing 18th-century plasterwork. At 18 Parnell Square, Dublin, they added gilded friezes and lincrusta mouldings with paintwork in the manner of Angelica Kauffmann. Their Neo-Classical work is best preserved at Coolmore, Co. Cork. There, the drawing room wallpaper has stenciled decoration in red and green, and medallions of classical figures painted on a blue ground. Sibthorpe specialized in decorative painting and created a Rococo painted ceiling and gilt interiors in the Royal Train for the visit of Edward VII in 1904. Sibthorpe continued their work as the leading decorators in Ireland until the 1960s. Other notable professional decorators were Pilkingtons of Kildare Street and J.F. Keatinge & Sons Ltd., who were founded in the 1882 and ceased trading in 1994.

Textiles were designed, manufactured and sold by Walpole Brothers Ltd. of Dublin, Belfast and London. The firm was founded in 1766 and supplied hand-woven Irish double damasks and linens often with hand embroidery made by the Royal Irish Linen and Damask Manufacturers. Whyte & Sons specialized in glass and china and household goods as did the great Dublin department store Pim Brothers Ltd. of South Great Georges Street, established in 1841. Combridge & Co. Ltd. were picture framers, gilders and stationers who specialized in decorative bookbinding and library fittings. Cramer, Wood & Co. sold musical instruments and a range of pianos for the cluttered Victorian interior.

Several country house interiors were redecorated in the grand manner although none with such opulence as Castle Forbes, Co. Longford. Beatrice, Countess of Granard was assisted by two firms of architects, Frederick Foster of London and Kaye, Parry & Ross of Dublin, who were employed to execute her ideas. The French interior decorator Fernand Allard and the firm of Lenygon and Morant of 31 Old Burlington Street, London, were more influential in the design of the interiors. Allard designed the hall and staircase which is lined with grey ashlar. The London decorators fitted out Cunard liners at this time and they designed the dining room, lined with oak paneling and a *trompe-l'oeil* ceiling of an open dome. The drawing room is an English Palladian room in the manner of William Kent. Lavish ceilings were imported and an 18th-century ceiling was inserted in the drawing room depicting an allegory of the *Genius of Architecture*. In the library Faith, Hope and Charity preside with the Four Seasons set in each corner of the ceiling.

At Birr Castle, Co. Offaly, Anne, Countess of Rosse (the founder of the Victorian Society) reinterpreted some of the most beautiful Victorian rooms in Ireland in the skillful arrangement of furniture, flowers and pictures. The ballroom is hung with Victorian green and gold damask patterned wallpaper and during the 1940s Lady Rosse hung red flock wallpaper in the dining room and restored the dado. In the 1950s Luttrellstown Castle, Co. Dublin was transformed in the grand manner by the Hon. Mrs. Aileen Plunket who created interiors of great elegance with the help of the English decorator, Felix Harbord, a pupil of Sir Albert Richardson. A mixture of styles was brought together in the 18th and 19th century rooms. These incorporated a Baroque painted ceiling by Sir James Thornhill (1675/6-1734) and grisaille paintings by Peter de

Gree (d.1798) of allegorical scenes depicting *Mercury introducing the Arts and Industry to Ireland*.

In the post-war years a number of houses were decorated by their owners who relied on their own good taste. Dunsany Castle, Co. Meath with Neo-Classical plasterwork by Michael Stapleton was elegantly redecorated by Lady Dunsany with impeccable taste and individual style. A new delicacy was introduced in the warm colours used and the arrangements of Sèvres porcelain and pictures. Russborough was bought by the Beits in 1951 and Sir Alfred and Lady Beit restored the house to form a backdrop for one of the finest private collections of art in the world.

International Modernism began to filter into the design of domestic interiors in the Dublin suburbs during the 1930s. Robinson and Keefe designed semi-detached "Sunshine" houses at Dollymount, Dublin, that retained a traditional internal plan but had unadorned white walls, windows and doors with decorative glazing bars, and tiled chimneypieces. Walter Gropius visited Ireland in 1936. The greatest Irish exponent of his theories was Michael Scott (1905–1989). Scott's house Geragh, near Dun Laoghaire was designed in 1937–38, exemplifying the Gropius style in the severity of its white interiors and tubular steel furniture. The Australian architect and designer Raymond McGrath (1903–1977) was appointed to the Office of Public Works and was responsible for the redecoration of many public buildings, including Aras an Uachtarain (President's Official Residence) in a neo-Georgian style incorporating 18th-century plasterwork and designing carpets based on the ceiling decoration. McGrath did much to revive Donegal Carpets and Waterford Glass. Eileen Gray (1879–1976), the creator of some of the most spectacular Parisian interiors of the 1920s, was born in Ireland and during the 1960s some of her abstract carpet designs were reproduced and manufactured in Ireland.

In the 1950s two significant events took place; the Hon. Mr. and Mrs. Desmond Guinness bought Leixlip Castle, Co. Kildare, and in 1958 they re-established the Irish Georgian Society. At this time very few people in Ireland appreciated Irish interiors, and the redecoration of Leixlip was important in that here for the first time a specifically Irish look was recreated using heavily carved 18th-century Irish furniture. The style may be characterized by an overall simplicity, the use of strong colours, blues, reds and brilliant white, the dramatic placing of furniture and the rejection of fussiness and upholstery. This was a highly architectural style that respected the structure of interiors, windows were left uncurtained, layers of flaking paintwork left untouched and furniture unrestored. Shells, prints and books were collected, arranged alongside doll's houses and the ubiquitous fresh green or golden autumnal beech leaves. This new aesthetic of the informal, unrestored yet grand interior was well-suited to Irish houses that had been neglected for generations. These ideas were disseminated through the Irish Georgian Society in the rescue projects that it sponsored, most importantly at Castletown, where repainting was done with sensitivity. Entire rooms were shown to the public in an untouched state. In the conservation work that the society undertook in Dublin this minimal intervention left the rooms essentially undecorated, and this may best be seen at 13 Henrietta Street where the Casey family have maintained the purity of a very grand but unrestored interior. Many influential

English and American decorators visited Leixlip and Castletown and were greatly influenced by these ideas.

This renewed interest in historic interiors encouraged many country house owners to restore their family property. Desmond FitzGerald, Knight of Glin, was a kindred spirit of the Guinneses in the revival of interest in Irish interior design and furniture. Glin Castle, Co. Limerick has been carefully restored and provides a unique setting for a collection of Irish furniture and pictures. In Dublin the large houses in the unfashionable north inner city had been turned into tenements in the 19th century. This slow decline has been arrested and although many of the finest interiors have been lost, among those that survive there have been some remarkable restorations. Since the 1960s a dozen houses have been rescued or restored, particularly in North Great Georges Street and Henrietta Street.

Isokon

British furniture manufacturers, 1931–1939

Founded in 1931 by Jack Pritchard and Wells Coates, the Isokon company was one of only a handful of inter-war British forays into Modernism. Pritchard, then working for the Venesta Plywood Company, had come across Coates's shop interiors for the Cresta Silks chain (1929–32), where plywood was used, not as a cheap substitute for solid wood as was generally the case, but as a truly modern material. Pritchard subsequently commissioned Coates to design a house for his own family on Lawn Road in Hampstead; a brave decision considering that the engineer and former *Daily Express* journalist had not, at that point, had anything substantial built. Through discussion about what was the most socially responsible use of land in London, the project eventually developed into a block of "minimum" flats, and the Isokon company was founded principally to manage its erection and promotion. (The name "Isokon" was coined because of Coates's preference for drawing his designs in isometric projection.)

Completed in 1934, the monolithic concrete structure, with its bold external staircase and access galleries, and which the one-time resident Agatha Christie likened to a cruise liner, represents one of the first appearances in the UK of what was to become known as the International Style. The internal planning of the building was equally revolutionary. The flats were designed as complete "ready-to-live-in" dwellings specifically for young single people with few possessions. It was Coates's belief that furniture, like the plumbing system, should become part of the fixtures of a dwelling, rather than be taken from home to home. Moreover, built-in multi-purpose furniture would ensure a more economic use of space; an important consideration in a modern city. Each of the 22 minimum flats – consisting of a living / bedroom, kitchen, bathroom and dressing room – occupied only approximately 271 square feet (25 square metres), and was comprehensively equipped with standardized built-in furniture, most of it manufactured from plywood.

Perhaps because simplicity and lack of ornament in home furnishings are today not unusual, it is easy to overlook the significance of the Lawn Road interiors, which, as Nikolaus Pevsner noted, made no "compromises with convention". The undisguised use of modern materials, such as plywood and tubular steel, which had not yet entered the everyday vocabulary of the home, and the inclusion of built-in furniture (which effectively removed choice from the resident) were indeed unconventional design decisions – especially in England, which lagged behind the rest of Europe in its acceptance of Modernist ideas. References to the more established European "masters", particularly Le Corbusier, abound in contemporary descriptions of the building, although, as one commentator has noted, Coates's enthusiasm for built-in furniture may have been influenced as much by the traditional architecture of Japan, where he was brought up, as by Continental Modernism.

Nevertheless, the notion of minimal living, or *Existenzminimum*, had a great deal of currency among Modernist sympathizers, having been advocated at the 2nd meeting of the Congrès International d'Architecture Moderne (CIAM) in Frankfurt in 1929, as one solution to Europe's housing prob-

lems. While Coates and Pritchard were undoubtedly inspired by the socialist rhetoric of policies such as this, the Isokon flats were beyond the means of those most in need of new housing. Indeed, simply to ensure their erection, the flats were pitched at the middle-class *cognoscenti*.

The Lawn Road flats quickly became a focus for Hampstead's intellectual and artistic communities, themselves soon to be augmented by an émigré population fleeing Germany. While Coates clearly played a very important role in the formation and direction of Isokon, it was the involvement of a number of these émigrés – Walter Gropius, Marcel Breuer and László Moholy-Nagy – which has done most to ensure the company's enduring significance in the eyes of design commentators.

Pritchard invited Gropius to England to design a new block of flats (in partnership with E. Maxwell Fry), to be built in an affluent suburb of Manchester. In the event, this project, as well as a small development planned for Birmingham and a much-celebrated scheme for Windsor, fell through due to lack of funds, and Isokon focused its attention on its furniture operations. The company had been involved in marketing Coates's plywood bookcases as early as 1933, but the formation of the Isokon Furniture Company in 1935 effectively marked the transition from architecture to furniture. More significantly, it also signalled the adoption of *moulded* plywood construction over more conventional techniques. The new company's Bauhaus-inspired philosophy – which stated that form should be determined by function rather than superimposed ornament – stressed Isokon's commitment to plywood, which, Pritchard felt, offered more "traditional English comfort" than the arguably more austere tubular steel furniture from the Continent. Nevertheless, the modernity of plywood was emphasised through reference to its use in the aircraft industry.

Gropius became Isokon's Controller of Designs, although only one of his designs was ever manufactured. But it was his insistence that his former Bauhaus colleague, Marcel Breuer, join the design team that proved an important contribution to the company's work. Breuer set about exploiting plywood's intrinsic properties through the re-design of an aluminium chaise-longue he had designed for Wohnbedarf in 1933. The resulting *Long Chair* (1936) demonstrates Breuer's thorough understanding of the material and bears comparison with the furniture of Alvar Aalto. Like much of Aalto's furniture, the Long Chair consists of a single sheet of moulded plywood supported on thick laminated wood leg-forms. Its significance arises, in part, from the fact that, like Aalto's *Paimio* chair, it could not have been manufactured from solid wood and did not try to pretend it was. Moreover, it illustrates very effectively the state-of-the-art of plywood technology in 1936: not until the advent of stronger adhesives would it be possible to mould plywood into complex compound curves.

Apart from a set of nesting tables and a *Short Chair*, Breuer's other designs for Isokon were less satisfactory; their originally simplistic designs were compromised by the need for lateral bracing which gave them a heavy and overworked appearance. It is perhaps for this reason that Isokon furniture has not entered the canon of "classics" to the same degree as many pieces by Le Corbusier, Aalto and Breuer himself. Nevertheless, Breuer's work for Isokon – which also included the Isobar restaurant in the Lawn Road flats – rates among the

Isokon furniture designed by Marcel Breuer, c.1936

most successful realisations of Modernist ideals in the UK, and represents a conscious attempt to tailor those ideals to the perhaps rather spurious notion of Englishness.

In 1937, a shortage of architectural commissions in the UK led Gropius to seek work in the United States; he was followed shortly afterwards by Breuer. Production of Breuer's furniture continued, but the onset of war in 1939 effectively halted the company's supply of timber from Estonia. After the war, Pritchard made several attempts to restart the company, even manufacturing a number of new designs by Ernest Race. Without the enviable Modernist credentials of Gropius, Breuer or Moholy-Nagy (who had designed Isokon's graphics) behind him, however, Pritchard met with little success and the company eventually folded. Nonetheless, between the wars, Isokon was at the cutting-edge of design practice. The mere presence of Gropius *et al.* clearly makes Isokon significant, but the company's modest output continues to look as original and uncompromisingly modern today as it did sixty or so years ago.

Isozaki, Arata 1931-

Japanese architect and designer

Arata Isozaki was Japan's leading interpreter of Postmodern trends from the West in the early 1970s when he established personal contacts with Peter Cook in London, Hans Hollein in

Vienna, and Peter Meier and Peter Eisenman in New York. A prolific essayist as well as designer, Isozaki attacked Modern architecture in several books. In the process, he challenged the dominant modern Japanese synthesis, devised by an older generation trained in the 1930s and led by Kenzo Tange and Kunio Maekawa, of trabeated concrete-framed buildings expressive of traditional Japanese carpentry.

From 1954 to 1963 Isozaki was a member of Kenzo Tange's Team and Urtec. Under the stimulus of Metabolism, he enlarged traditional column brackets to the scale of major urban elements in *Cities in the Air* (1960–62), and used ruined Greek columns to support giant lattice beams in *City in Ruins* (1962) which extended in a free system of towers over a chaotic Tokyo. These proposals anticipated the big-beam style of his trabeated beam compositions during the 1960s after he left Tange.

Isozaki's career is punctuated by sudden shifts in style every ten years. This periodicity resulted in a succession of style phases: from the big-beam expression in raw concrete of the 1960s, much of the work being at Oita, Kyushu, where Isozaki was born; to the mannerism of the 1970s, which was followed in the 1980s by international eclecticism, which in turn launched into schizoid eclecticism and hyper-tech in the 1990s. Mannerism was present in one form or another in all the phases, in the exaggerated enlargement of structural beam elements in the 1960s, 45 degree geometry and space bridges, which was succeeded in the 1970s, immediately after Expo '70, Osaka, by a Postmodern orientation that exploited obsessive compositions of neo-Platonic pure forms such as cubes, cylinders and spheres. In the 1980s this mannered idiom flowered into an energetic international eclecticism, with motifs drawn from contemporary styles and sometimes the early Modernism of the 1920s and 1930s, and often looked back across Western architectural history to Claude Nicolas Ledoux, 16th-century Italian Mannerism and Andrea Palladio. By the 1990s, international eclecticism became more *ad hoc* and arbitrary and led to a Schizoid eclecticism that combined motifs that broke up the presumed normalities of integrated form. At the same time, Isozaki experimented with a hyper-tech expression as the occasion demanded. In all of this, Isozaki mirrored the ongoing cultural schizophrenia and confusion of Japan in an era of unprecedented economic growth characterised by a deep obsession with Western culture.

The structuralism of Isozaki's early interiors, where the material was raw concrete, gave way to the use of polished marble, red Indian sandstone, rusticated granite, reflective aluminium panels and silver tiles. From the 1980s on, Isozaki used colour more, and contrasted rough natural textures with smooth artificial materials, together with mirrors and glass blocks.

In his early big-beam works at Oita, the interiors were defined by beams, with the primary material exposed concrete. The entry hall and reading spaces of the Oita Prefectural Library (1962–66) resulted from the placement of exceptionally large U-shaped off-form concrete beams resting on other hollow beams or bedded in cross walls. As with the earlier mega-structure proposals, the primitive structure of the beams defined the character of the interior spaces. These were dynamic and directional in the Oita Library; for the Oita Branch of the Fukuoka Mutual Bank a spine bridge under

diagonal roof beams energised the white interior assisted by bright vivid reds and blues.

The Fukuoka Bank Headquarters, Fukuoka (1968–71) had a suite of remarkable rooms: the meeting room had concentric squares inscribed on the walls and ceiling, the subdued lighting adding to the hypnotic effect of its identical walls; the boardroom in full-blown High-Tech with curved aluminium panels and prominent air nozzles had a decidedly science fiction unreality; but most arresting of all was the large Surreal eye at one end of a black and white chequered floor.

The Kitakyushu City Museum of Art (1972–74), with its twin gun barrels, was notable for its square die-cast aluminium panels and polished marble floors, which produced an effect of public magnificence. Like the previous big-beam concrete works the spaces were the result of the structural scheme. The Museum of Modern Art, Takasaki (1971–74) was clad in polished aluminium panels and based around a composition of cubes which supplied universal frames for the temporary objects on display. The interiors were a remarkable tour de force, with architecture, sculpture and interior design merged in a total work. It explored such typical Mannerist devices as false perspective, dissonant scale and the decaying form. Most notable was the main staircase which was treated in such a way that the edges appear to merge with the polished walls, rising in infinite axial extension to the cylindrical half-landing. Within the first floor lobby, smaller rooms were inserted within the main cube as a Mannerist play on the room-within-a-room theme. The most striking object is a superbly executed stepped marble platform at the far end of the entrance lobby; its perverse perspective and over-large steps made it appear much smaller. Traces on the ceiling and walls of the lecture hall disrupted it.

In the 1970s, semi-cylindrical barrel vaults, inspired by Palladio, took the theme of infinite uni-axial extension and combined it with plastic and passive form which was acted on by powerful external forces. The arbitrary character of such works (a question mark for a golf club), reflected Isozaki's preoccupation with linguistics. On this occasion, the Golf Club barrel vault was moulded into a sign for Isozaki's puzzlement over why the Japanese are obsessed with golf. The best vaulted composition was the Hayashi House, Fukuoka (1976–77), which, like a fragment of plumbing, consisted of a leading vault feeding into two small extensions which covered the main living area and sleeping quarters. The entrance foyer had mirrors on the two facing walls which multiplied the image of the entry's circular vault. The effect was both arresting and disorienting – a similar illusion was achieved in the Mickey Mouse canopy of the Team Disney Building (1991).

Tsukuba Center Building, Tsukuba (1979–83) had Isozaki's most important interiors in the 1980s. So great was the totality of its conception it is difficult to separate the interior from the exterior design, especially the ironic sunken Campidoglio. Besides Michelangelo, the project owed much to Isozaki's fascination with Ledoux at that time, especially the Salt Works at Arc-et-Senans, which was echoed in the banded columns and rusticated masonry; this was repeated in the concert hall and lobby areas where refined polished surfaces touched rough stone facings in a contest between natural and man-made. Dipping into history, Isozaki refers to Karl Friedrich Schinkel in the night sky ceiling of the banquet hall. At Tsukuba, Isozaki

engaged in a wide use of historical motifs assembled in a contrived Mannerist way with inversions, reverse perspective effects, traces projected from inside imaginary rotated cubes on walls and ceilings to undermine the surface appearance, and subversive angled pavilions, all of which contributed to a pervasive feeling of unease and anxiety. Tsukuba Center was brilliant and marvellously sophisticated, yet underneath it all it was hollow. For all its classical allusions, the classical was subverted in a virtuoso display of architectural facility.

In the Los Angeles Museum of Contemporary Art (1981–86) Isozaki returned to the earlier Fukuoka Bank Headquarters to use red Indian sandstone and to a quieter aesthetic of neutral interiors lit from above that retreated before the art objects on display. It was a mixture of Palladio and Egypt with its palms and pyramids. Because the museum was set below the plaza, light was introduced through the roof through pyramid-shaped skylights and translucent ceilings. As was to be expected, Isozaki's wavy Marilyn Monroe silhouette dominated the entry and lower court.

The Art Tower Mito, Ibaragi (1986–90) was less restrained. Its 100 metre high symbol tower was pure hyper-tech. The hexagonal concert hall casually repeated the vault of Sir John Soane's Breakfast Parlour at 13 Lincoln's Inn Fields. It is refined and elegant with precise timber-panelled seating terraces and creamy walls and ceiling. The tower lobby was Viollet-le-Duc Gothic structuralism in hyper-tech mode with its great angled steel tubes springing from plated columns. The cylindrical Theatre repeated the restrained grey exterior but it was deepened to a metallic blue. Sandwiched between, the entrance hall was lit by an inverted triangular onyx window whose shape overturned structural logic. The walls of the conference hall were decorated with voluminous drapes.

The Disney Building at Lake Buena Vista, Florida (1987–91), was extremely successful and was typical of Isozaki's mature 1990s style. It was calm, assured, less intense, but the earlier Mannerism was still evident in the Dadaist entrance lobby, in the 36 metre high truncated cone and rotated cubes whose forms were disguised by decorative areas of colour and lines. The curtain wall of the 250 metre axial block was converted to a reflective tartan grid of blue and white stripes and squares. The great sun dial connective space was punctured by an elevated bridge which recalled Isozaki's earlier dynamic interpenetrating forms in the 1970s, but, in the 1990s, structure gave way to colour and pattern, and squares were repeated endlessly in subdividing windows and as isolated openings. The impact of the truncated open cone depended on the circling movement overhead of sun and shadow on its brown surface with the yellow gnomon acting as a kind of Dadaist ornament or joke.

Isozaki's interiors show a typical Postmodern concern for widening the design vocabulary to enrich it beyond the limited functionalist scope of Modernism. His excursions into European architectural history are filtered through the agency of ideas from neo-Dada, Marcel Duchamp, Man Ray, and Shuzo Takiguchi. Isozaki's interiors are subversive in intent in relation to Modernism. His elevation of personal experiences to do with death and disintegration mean that his forms shatter, and what seems most solid disintegrates in order to reveal the darkness beneath the surface of things. His ultimate

concern is with emptiness in what is an intense and highly intellectual method.

Isozaki's subversive attack on conservative culture manifest in his Dadaist bias towards ambivalent structured works and the imposition of a Western Mannerist metaphysic of unease and instability reflected the Japanese contemporary condition. As language has its rules, so architecture gains by the breaking and inversion of its grammar. In his recourse to the past, unlike 19th-century eclectics, Isozaki has aimed less at mimicking the past than at turning it inside out in order to drain it of meaning.

Biography

Born in Oita City, 23 July 1931. Graduated from the Architectural Faculty, University of Tokyo, 1954. Married the sculptor Aiko Miyawakiin, 1972. Worked with Kenzo Tange's Team and Urtec, Tokyo, 1954–63. Established his own architectural practice, Arata Isozaki and Associates, Tokyo, 1963; has also continued to collaborate with other architects and studios and was chief architect with Kenzo Tange for the Japan World Exhibition, Osaka, 1970. Designed textiles and furnishings from the mid-1970s. Has taught widely in the United States including visiting professorships, University of California at Los Angeles, 1969, Columbia University, New York, 1976 and 1979, Harvard University, Cambridge, Massachusetts, 1981, and Yale University, New Haven, Connecticut, 1982. Juror for the Pritzker Prize, New York, 1979–84. Numerous prizes and awards including Annual Prize, Architectural Institute of Japan, 1967 and 1975; *Interiors* Award, New York, 1983; Mainichi Art Award, Tokyo, 1983; Gold Medal, Royal Institute of British Architects, 1986. Honorary Fellow, American Institute of Architects, 1983; Honorary Member, Bund Deutscher Architekten, Germany, 1983; Member, Accademia Tiberina, Italy, 1978; Honorary Fellow, Royal Institute of British Architects, 1994; Honorary Academician, Royal Academy of Arts, 1994.

Selected Works

Interiors

- 1962–66 Oita Prefectural Library, Oita City (building and interiors)
- 1966–67 Fukuoka Mutual Bank, Oita City (building and interiors)
- 1968–71 Fukuoka Mutual Bank Headquarters, Fukuoka (building, interiors and furniture)
- 1971–74 Museum of Modern Art, Takasaki, Gunma (building and interiors)
- 1972–74 City Museum of Art, Kitakyushu, Fukuoka (building and interiors)
- 1973–74 Fujimi Country Club, Oita City (building and interiors)
- 1973–74 Kitakyushu Central Library, Kitakyushu, Fukuoka (building and interiors)
- 1979–83 Tsukuba Center Building, Tsukuba Science City, Ibaragi (building and interiors)
- 1981–86 Museum of Contemporary Art, Los Angeles (building and interiors)
- 1981–86 Björnson Studio-House, Venice, California (building and interiors)
- 1983–85 Palladium Club, New York City (building and interiors)
- 1983–90 Sant Jordi Sports Palace, Barcelona, Spain (building and interiors)
- 1986–90 Art Tower Mito, Mito Ibaragi (building and interiors)
- 1987–90 Kitakyushu International Conference Center, Fukuoka, Japan (building and interiors)
- 1987–91 Team Disney building, Buena Vista, Florida (building and interiors)

- 1990–94 The Center of Japanese Art and Technology, Krakow, Poland (building and interiors)
 1991–92 Guggenheim Museum, Soho, New York City (additions and interiors)
 1991–94 Museum of Contemporary Art, Nagi, Okayama, Japan (building and interiors)
 1991–95 Kyoto Concert Hall, Kyoto, Japan (building and interiors)
 1993 La Casa del Hombre (House of Man), La Coruña, Spain (building and interiors)

Isozaki has also designed dinnerware for Swid Powell; rugs for Vorwerk (1988); furniture including the *Marilyn* chair and table by ICF (1973–83), *Fuji* cabinets by Memphis (1981), and bed exhibited at the Milan Triennale in 1985; and jewellery by Cleto Munari (1986).

Italy

Following the decline of the Roman empire and with the rise of Christian patronage, medieval Europe passed through the Early Christian, Byzantine, and Romanesque periods into the styles and stages of Gothic art and architecture. In Italy semi-independent city states developed, many based on trading and banking activities and represented in other commercial centres of western Europe. A rebirth of classical ideas arose in the 14th century from the rediscovery of classical literature; the works of Dante, Petrarch, and Boccaccio stimulated a new age of intellectual enquiry, philosophical and scientific. Against this background of wealth and the pursuit of knowledge, profound changes were about to take place which would leave indelible impressions on history until the Industrial Revolution.

In Florence, the powerful Medici banking family, engaged in local affairs spasmodically since 1296, encouraged patronage of the arts. In company with like-minded families – Pitti, Rucellai, and Strozzi – they pursued vigorously the emerging ideals of the Renaissance. A new cultural spirit made use of the classical past to inspire the future; evidence of ancient Rome sparked the search for new rules of design.

Because they had applied this new thinking to commerce and art in advance of any competitors, the Italian states had accumulated reserves of wealth. Beyond Medici dominance in Florence, other princely banking and trading families such as Farnese, Gonzaga, Este, and Sforza spent lavishly on public building works which contributed to civic pride and amenity. Prosperous citizens spent well on their own homes, as private sector building was thought to honour the community. Education improved and the invention of printing spread freedom of thought. Tuscany, too, made use of these new facilities in the transformation of art and architecture.

Although in some parts of Italy – including Sicily and particularly the Venetian Republic – medieval styles persisted into the 16th century, Florence and Rome were invigorated by the climate of change known as the Renaissance. Key Florentine protagonists, Leon Battista Alberti (1404–72) and Filippo Brunelleschi (1377–1446), defined geometric systems of

proportion and perspective, Brunelleschi having studied in Rome after the turn of the century. His dome for Florence Cathedral (1420–34) harmonized classical motifs and new structural methods with a Gothic church – one of the first expressions of the Renaissance. In 1485 Alberti, more academic in approach, published his *De Re Aedificatoria*, setting out a design ideal “that nothing could be added, diminished or altered, but for the worse”. Vitruvius’s *De Architectura* was printed in 1486. Written in the reign of Augustus (27 BC–14 AD), it was not translated into Italian until 1521, becoming a lasting source of classical inspiration for many generations. The young theorists, chiefly Andrea Palladio (1508–80), Giacomo Barozzi da Vignola (1507–73), and Vincenzo Scamozzi (1552–1616) studied and interpreted Vitruvius and codified rules and proportions of the five ancient Orders of Architecture – Tuscan, Doric, Ionic, Corinthian, and Composite. Ideal proportions of the human body were mathematically formulated and used to great effect by Alberti and Brunelleschi.

New elements were added to the Renaissance vocabulary, principally a new form of dome with its supporting pendentives and the balustrade with its candelabra-like or vase-shaped balusters. Decorative treatments included rusticated stonework, fashionable initially for the external walls of early Florentine palaces and sometimes transformed into a painted feature for interiors. Much was owed to artists, sculptors, and other craftsmen and many of the architects started in this way, Brunelleschi as sculptor, Ghiberti as metalworker.

Many of Brunelleschi’s designs were built after his death. The Pazzi Chapel at Santa Croce, Florence (1429–46) demonstrates early Renaissance qualities of deceptive simplicity and balance, achieved in a scheme of grey stone classical dressings and mouldings set into near-white plastered backgrounds. Mouldings and oculi are offset by limited frieze decoration and roundels of glazed terracotta reliefs coloured by Luca della Robbia, decoration serving architecture to achieve unity. Secular building took perhaps even greater steps forward – palaces were less fortified than before and housed enormous wealth in terms of building and contents.

The Ducal Palace at Urbino (c.1444–82), which entered the Renaissance after the appointment of Luciano Laurana as architect by Federico di Montefeltro in 1465, relies on elegance and purity of line. Doorcases and hooded carved fireplaces provide centres of interest in otherwise restrained, white plaster backgrounds. In the Sala degli Angeli, the well-known frieze of the chimneypiece bearing gambolling angelic putti is the work of Domenico Rosselli. The palace also contains outstanding intarsia work in the doors and cupboards of the studiolo designed at least in part by Botticelli. Portraits from the studiolo and most of the furnishings have been scattered to collections and museums, but in spite of the empty rooms, traces of influence from Piero della Francesca, Alberti and Laurana who was probably familiar with Diocletian’s Palace at Spalato (Split), add to Federico’s achievement.

The first Medici villa in the High Renaissance style was built at Poggio a Caiano, designed by Giuliano da Sangallo (1443–1516) and completed in 1485 for Lorenzo de’ Medici. Instead of the usual central cortile, there is a two-storey barrel-vaulted hall with coffered gilded stucco ceiling. Lorenzo’s son, Pope Leo X, commissioned the frescoes which were started in

1521 by Franciabigio and finished in a second stage in about 1579 by Allori. Pontormo and Andrea del Sarto contributed to the overall scheme which recorded allegorically various events in Medici family history. Most apartments in the villa suffered 19th-century redecoration, but the great hall survives.

Donato Bramante (1444–1514) worked as a painter under Laurana at Urbino and in mid-life changed to an architectural career in which he exercised wide influence in his handling of space as the chief component of interior design. This was initially demonstrated in the Tempietto in Rome, a small circular “temple” in the courtyard of S. Pietro in Montorio, 1502.

The Palazzo Venezia with its loggia dating from 1467–71 and completed after 1500, grew into the first great Renaissance palace in Rome, home to Paul II and his magnificent collections. Its architect is unknown but attributions have been made to Alberti, Rossellino, and Giuliano da Maiano.

The new ways of thinking fostered an interest in the domestic interior, the layout of rooms, and their fittings and furnishings. Relative stability in society allowed for improvements in convenience and privacy to an extent never practicable in medieval times. The stringing together of rooms reached from a main hall and dining space had, by the mid-15th century, been overtaken by more ingenious planning. Larger town houses were mostly planned round an open courtyard which was often colonnaded to provide protection from the weather and easy access. Planning of country villas was less restricted and symmetry more easily achieved where land was available and the need for defence had diminished. Windows could be placed looking outwards over the landscape, radically affecting the outside appearance and giving freedom of internal and external design.

Before the advent of the Baroque style, rooms were usually rectangular, possibly with flat beamed ceilings on upper floors and for smaller rooms. These would coexist with vaulted or deeply coved ceilings if height was a consideration and, where additional space was required, columns could be introduced for structural and visual reasons. The supporting ceiling members may have been exposed or concealed by a suspended ceiling, with decorated soffit. From the 16th century ceilings became elaborate, with gilded carved wood coffering in geometric shapes, until Baroque outlines began to take over. A number of the Palazzo Vecchio rooms in Florence dating from the 1480s have elaborate ceilings, for example the Sala dei Gigli and the Audience Room, the latter by the Del Tasso brothers.

Doors and windows had architraves in stone or plaster, with varying degrees of carving or stucco decoration. Pilasters in classic styles with entablatures or pediments might, in the most luxurious surroundings, be in marble or *scagliola*. Windows were by this time usually glazed and shuttered. Chimneypieces formed the focal point and gave owners, architects, and sculptors opportunity to show their talents. Fireplace accessories could also be stylish and decorative: sculpted figures or simple architectural forms in worked iron, steel and bronze.

Fired earth in the form of thin bricks or tiles was the most usual flooring, in geometric shapes in simple but effective patterns, particularly the enduring herring-bone. Terrazzo, a mix of marble chippings with stucco and stone dust spread with a trowel and polished when dry, was one alternative, and marble, laid in patterns using varied natural colours came at

Italy: Camera degli Sposi, Palazzo Ducale, Mantua, frescoes by Andrea Mantegna, 1465–74

the top of the scale, in ecclesiastical buildings even more than the imposing palazzi. Timber was another medium for flooring, particularly on upper floors where there was less likely to be a problem with damp. Patterns were produced from naturally contrasting woods, but the finest intarsia inlays were reserved for chests, doors, and cupboard fronts.

Before the Renaissance, Italian furniture seems to have been generally primitive in comparison with the work produced by sculptors, painters, metal, and leather workers. A medieval tradition of church-furniture making did exist, but such fine quality woodwork was slow to enter the domestic market. Cassoni or chests were perhaps the most common pieces, for storing, securing, and carrying personal and household belongings, painted more often than carved until the early 16th century fashion for deeply cut relief panels of scenes sometimes taken from the engravings of famous painters. Carved walnut chests dating from c.1560, with gesso and gilded surrounds to the panels, can be seen in London's Victoria and Albert Museum, and the Museo del Castello Sforzesco, Milan, possesses a fine Lombard chest with intarsia panels.

Chairs varied from the throne-like, upholstered and tasselled ones for the nobility, descending according to rank through smaller, cushioned versions to simple ladder-backs, the older X-form chairs, and finally to wooden stools. The amount of carving and decoration varied considerably, the most ornate

being the most likely to have been preserved. Tables with columned or balustered underframes and fixed tops took the place of earlier trestle types, and, for the grand interior, inlaid marble tops on carved and gilded bases gave splendid opportunities to artists and craftsmen during the 16th century.

Beds ranged from the planks-on-trestles primitive type up through the *lettiera* with frame and headboard to those with posts, testers, valances, and curtains. Evidence of these refinements exists in contemporary paintings, for example, Sodoma's *Alexander Visiting Roxana* in the Farnesina, Rome (1512) shows a bed of magnificent architectural design, although no surviving examples are recorded. Bed-hangings, mattresses, pillows, sheets, and bedcovers were all in use, with wall and door curtains to subdue draughts and give added privacy. Italy produced fabrics of great variety, in wool, silk, linen, and cotton. Patterns were woven or embroidered; cotton with painted patterns was imported, probably as Indian chintz via Portugal. Summer and winter curtains were sometimes hung to suit the seasons and mosquito nets provided protection.

Michelangelo (1475–1564) and Raphael (1483–1520) worked contemporaneously in Florence and then in Rome, and were key figures in the Renaissance but were orientated by great difference of temperament in separate stylistic directions. Raphael spent many years on the papal apartments, the stanze

and loggie in the Vatican Palace, for the Medici Pope Julius II, creating a magnificent parade of Pompeian interiors based on ancient models but brought to Renaissance life by the artist's impeccable skill and freshness of vision. Michelangelo had also been called to Rome by Pope Julius in 1505, three years before Raphael, painting the Sistine Chapel as a vast story of the Creation and man's relation to God (1508–12). In his architectural design for the Laurentian Library, Florence, his unorthodox treatment of the classical orders demonstrated his adherence to the innovative style we now call Mannerism. The library staircase, completed later by Giorgio Vasari (1559), introduced scrolls, exaggerated balusters, and a wanton ingenuity in the combination of outer flights of straight edged steps flanking curved and recurved steps in the central flight. The pilasters on window surrounds have reverse tapers, from top to bottom, an unmistakable departure from High Renaissance handling of established elements. Classical motifs had burst out of theoretical restraints with curved, scrolled, and broken pediments, vigorously-posed figures, strongly emphasized cornices and the addition of acanthus leaves and grotesques. These features, augmenting Michelangelo's earlier freedom of expression in the well-known sculptures and in the completion of the Sistine *Last Judgment* finished in 1541, exerted widespread influence. Michelangelo's Mannerist style affected Italy and northern Europe as the precursor of the Baroque. In Rome, Baldassare Peruzzi (1481–1536) showed a brilliantly executed Mannerist style in the interiors of the Villa Farnesina (1509–11) and the Palazzo Massimo (1533–36) with *trompe-l'oeil* scrolls and stuccoes.

Mannerist tendencies reached Mantua in the 1520s where Giulio Romano's frescoes for the Palazzo del Te incorporated influences absorbed while working with Raphael and Giovanni da Udine in Rome during the preceding decade. The classical reliefs in the Mantua Palazzo's Sala degli Stucchi came from the same Raphael school, but in the famous Sala dei Giganti, Giulio eliminated the frieze and covered the walls entirely with the apocalyptic collapse of huge sections of the composite order of architecture on top of writhing giants. Restraint is abandoned in favour of dramatic energy. Francesco Primaticcio worked as assistant to Romano on the frescoes and used his experience to very good effect, moving to the France of François I where, at Fontainebleau, he and Rosso Fiorentino transformed the interior of the Château in a manner far more elegant than that of the Palazzo del Te.

In the Veneto, Gothic had given way more slowly to the reborn classical style, but the change, once started, expanded quickly. The first work of prime classicist Andrea Palladio was the Villa Godi at Lonigo c.1537 where a repertory of landscape, grotesque, and illusionist relief, all in fresco, decorates the *piano nobile* interiors executed by Gualtiero dall'Arzere, Battista del Moro and Giambattista Zelotti.

Palladio's Villa Caldogno near Vicenza, contains lackadaisical atlantes figures in grisaille holding up a painted cornice, ignored by Gianantonio Fasolo's groups of pastoral figures in their intervening frescoed panels. Many Palladian palaces and villas in the Vicenza area followed in the 1540s and 1550s, all assuming fresco treatment as the main constituent of their interior decoration. Architectural influences from Raphael and Bramante reached Palladio through Michele Sanmicheli (1484–1559), reinforcing the classical strands of Renaissance

networks. Fresco as a medium remained popular over a very long period. Many painters were employed on Palladio's interiors, and the extent to which his strictly classical work dominated the overall effect varied. At the Villa Barbaro, Maser, Paolo Veronese may not have adhered to the principles of Palladio's forthcoming *Quattro Libri dell'Architettura* (1570) for his painted architecture, but their collaboration resulted in an undoubted masterpiece. Another Palladian interior, the Teatro Olimpico, Vicenza (from 1580), unites three-dimensional illusory architecture with a real Roman-inspired interior, completed by Scamozzi, in the form of a permanent stage set showing in detail three diverging city streets disappearing in false perspective to far distances behind a front screen based on a Corinthian triumphal arch.

In Rome, meanwhile, the Catholic church was in turmoil, with the Counter-reformation and the Council of Trent engaged in recovering ground lost to the Lutheran Reformation. The Papacy was deeply involved with the spiritual and physical reconstruction of the Church. Church building proceeded energetically and began to embody a powerful new iconography helpful to its re-establishment. Changes of style seen in the work of Michelangelo, Giovanni da Udine, and Giulio Romano continued to develop in freer modelling and greater use of heavily gilded mouldings. It was a time of many transitions and confusions before a clear conception of the Baroque emerged, led by Italy in spite of its fragmented political structure and its uneven absorption of differing aesthetic trends.

The Third Loggia and the Sala Paolina in the main palace and the Casino of Pius IV (c.1561) and the Villa di Papa Giulio all demonstrate proto-Baroque features and indicate a constant building programme originating from the Vatican. Between Mannerism and Baroque the line is not well defined but there is common agreement that the rule books of the Renaissance were no longer dictating every architectural detail. Giant orders and oval plans entered the repertory, and painting, still with a strong illusionary content, spread freely into available spaces without always being confined to definite compartments.

The growth of an innovative style practised by a limited number of architects and artists in the 16th century had been nurtured by Michelangelo. Others leading beyond Mannerism to form the full-blown Baroque are headed by Carlo Maderno (1556–1629), nephew of Domenico Fontana, designer of the Palazzo Barberini and a robust pioneer of the movement which was still concentrated in Rome. With his nephew, Francesco Borromini (1599–1667) he began work in 1625 on the palace for the family of Pope Urban VIII. Its completion in 1633 by Giovanni Lorenzo Bernini (1598–1680) established unequivocally the presence of Baroque design. The frescoed coved ceiling in the Barberini salone by Pietro da Cortona (1596–1669) was started in 1633. It conveyed in allegorical terms the triumph of the Church through the instrument of Divine Providence in the shape of the Barberini Pope Urban, symbolized in the centre of the ceiling by the three bees of his coat of arms. Painted architecture, garlands and greenery, putti, and mythical beasts intertwine with angelic and human figures, focusing on the corona of the Pope.

Italian Baroque made interior design, sacred and secular, into a heightened setting, theatrical in feeling, for which the

Italy: Galleria Farnese, Palazzo Farnese, Rome, 1597–1603

outside approach had prepared strong expectations. Bernini was to be the ideal practitioner in this art, although his years of preoccupation with St. Peter's piazza and its colonnades resulted in disappointingly few secular interiors. The Vatican's Sala Regia (1663–66) is a monumental staircase in which highly developed skill in the handling of inadequate and irregular space overcomes the drawbacks of the site, giving a worthy ceremonial means of access from the Pope's private apartments or from the Sala Regia to the main portico of the church. Correction of asymmetry and increase of effect through manipulation of perspective devices together with adroit placing and lighting of his equestrian statue of the Emperor Constantine show what Bernini could do in spite of unpromising conditions. False perspective had been used previously by Borromini in the Palazzo Spada (c.1653) and before that to Antonio da Sangallo's entrance to the Palazzo Farnese. Here, at the end of the 16th century, Annibale Carracci executed the complex painted ceiling of the Farnese Gallery. It owes much to Michelangelo's Sistine Chapel ceiling, but is composed with greater intricacy, leading up in a framework of quadratura from a sumptuous modelled and gilded frieze below the cornice to groups of grisaille herms and atlantes who appear to bear another painted cornice. Groups of life-like

figures and large imitation easel paintings carry the design upwards to the crowning centrepiece, *The Triumph of Bacchus and Ariadne*. Lanfranco and Guercino in Rome maintained the Baroque manner of ceiling painting during the 1620s for the Villa Borghese and Casa Ludovisi respectively.

A very different variation of the style was created by Guarino Guarini (1624–83), a Theatine monk who was in Rome undergoing his novitiate during the 1640s. Church building was a function of this order which often trained its own architects and which found in Guarini an eccentric individual talent. Starting from the full Baroque scene created by Bernini, Borromini, and Cortona, he was also influenced by Moorish design, probably having visited Spain and Portugal, but himself supplied the complicated mathematical schemes which he transformed into decidedly original buildings. The management of intricate spaces and the introduction of subtle lighting effects take the place of elaborate surface decoration, but even with a certain austerity there is no suggestion of weakened drama.

Piedmont in northern Italy gained the services of another architect trained in Rome, Filippo Juvarra (1678–1736) who again became known for his churches, chief among which is the Superga on a hilltop just outside Turin. His major domes-

tic work included the Palazzo Madama (1718–21) with its fine double staircase and sculptured detail, compared by Anthony Blunt to the Escalier des Ambassadeurs at Versailles. Stupinigi, a magnificent hunting lodge in the countryside a few miles away, was designed for his patron, Victor Amadeus II of Savoy and begun in 1729. It rises from an irregular star-shaped ground plan, centred on an oval ballroom, with a very large hexagonal court and wings positioned at diagonal angles. The tall galleried ballroom, apsed and pilastered with all the established Baroque characteristics of scrolls, wayward pediments, shells, urns, and putti in grisaille and quadratura, shows nevertheless a slight retreat from the most overwhelming exaggerations. Juvarra, like many of his contemporaries, maintained close control over the interior design and finishes, supervising and possibly executing some of the work himself. Lightness of colour in the *Triumph of Diana* ballroom ceiling and elsewhere may have been enhanced by the Venetian artists Giuseppe and Domenico Valeriani, indicating a definite bias towards the greater elegance and fancy that were to come. Among the last great Italian masters of the Baroque, Juvarra was still able to hold his own in relation to the rising French tide.

In 1720, Turin became the capital of the so-called Kingdom of Sardinia, being previously a substantial trading and commercial city under the Counts of Savoy. Benedetto Alfieri (1700–67) succeeded Juvarra as architect to the king and designed a series of small rooms and cabinets in the Royal Palace, many for the private use of the queen. A *cabinetto Cinese* indicates the extent to which Baroque was being superseded here by Rococo tastes.

Genoa had evolved its own branch of Baroque design. An early start in the first half of the 16th century had produced the High Renaissance palaces of the Strada Nuova to which the Palazzo Doria-Tursi (now Municipio), begun 1564 by Rocco Lurago, and the Palazzo Bianco (1565), by G. Orsolino and D. Ponzello, were later added. Steeply rising sites encouraged monumental double staircases but decorative virtuosity was reserved for the great rooms where fresco was still the preferred medium. In the Palazzo Bianco, flamboyant decoration in the late 17th and early 18th centuries was carried out by Domenico Piola and Lorenzo de Ferrari. This was largely destroyed in World War II but has since been restored in its original Baroque spirit. The Palazzo Rosso (1671–67) by Matteo Lagomaggiore, fared better and contains, within its hundred or more rooms, mature Rococo decorative treatments. The bedchamber has much white and gold with mirror-panelled doors, paintings in gilded wall frames, and a fine saucer-domed bed recess. C-scrolls and more white and gold feature in the Sala della Primavera.

Borderlines between Baroque and Rococo are not governed by date but arose from historic circumstance, variable resources, and artistic influences. Neither Florence nor Venice had fully rejected their classical Renaissance inspiration to assimilate Mannerism and subsequent Baroque. Florence was too deeply immersed in the culture which had originated there to embark on such radical changes once Michelangelo had concentrated his main activities in Rome, where the Papacy had attracted the available creative talent. Venice, too, failed to develop the full panoply of Baroque due, as Anthony Blunt has stated, to the ghosts of Palladio and Scamozzi hanging heavily over it in the 17th and 18th centuries. Instead, greater conti-

nunity of Palladian classicism existed, with little acknowledgement of the freedom of design which was altering the streets and palaces of Rome. Even the one grand essay in Venetian Baroque, S. Maria della Salute (1631–82), by Baldassare Longhena, retained a strong classical basis to support the large scrolled buttresses below the dome, each surmounted by a statue, which give such predominant character to this great octagonal church on the Grand Canal.

Interiors in the great palaces adhered more closely to the current Roman fashion, but this was not innovative and tended to cling to Renaissance grandeur. In the Sala del Maggior Consiglio of the Palazzo Ducale, the redecoration of 1577 produced works by Veronese, Palma Giovane, and Tintoretto. The later *Paradise* of Tintoretto (1588) claims to be the largest painting on canvas in the world and the overwhelming effect of a chamber so decorated is certainly Baroque in spirit. The Albrizzi, Rezzonico, and Pesaro palace interiors are particularly noteworthy, but the slow drift towards a lighter Rococo approach to decoration can be discerned. The quality of light and impressionistic colours of the Venetian painters continued to delight the eye without the need for excessive splendour.

Italian supremacy over the European artistic scene had been taken for granted since Renaissance times, but during the reign of Louis XIV (1643–1715) France usurped Italy's lead. The building of Versailles set the seal on French autonomy in art and architecture. Quality of workmanship and artistic excellence were deployed using French talent educated at the French Academy in Rome, established in 1666. Gradually Louis XV and Louis XVI styles replaced magnificence with the elegance and fantasy of the Rococo, although Italian artists, craftsmen, and architects continued to work throughout western Europe and to diffuse their influence in a way that was not easily superseded. Grand Tourism in the 18th century maintained strong links, and, in England, enriched country houses and art collections, not just through purchase of Italian artefacts but by way of the teams of painters, sculptors and stuccoists who were engaged on the interiors of English great houses.

A sense of direction was lacking in Italy in this period, as it came under French rule for a time in the north and Spanish Bourbon royalty in the Kingdom of the Two Sicilies in the south. Before moving to the mixture of late Baroque and Rococo of Naples and Sicily, a view of Venice and the mainland in the 18th century should be taken. The Villa Valmarana dei Nani, near Venice, was begun in 1669, probably by Antonio Muttoni, but acquired its famous frescoes after the property was bought by the Valmarana family. In the 1740s and 1750s, the Tiepolos, Giambattista and his son Giandomenico, decorated the main house and the guest house or foresteria in free and confident manner, fulfilling the prime purpose of much Italian fresco which aims to make important rooms extend into larger spaces, creating at the same time an autonomous work of art. Giambattista Tiepolo's *Sacrifice of Iphigenia* in the central salon is probably the work of most distinction, but in the Stanza della Villeggiatura, another interior is framed in illusionist Venetian Gothic design which contains surprising Neo-Classical hints. The guest house frescoes are generally considered to be by Giandomenico, and contain distorted, slightly sinister Chinoiserie figures and motifs of Rococo character. The architectural settings were

Italy: Salottino di Porcellana, Palazzo Reale, Pórtici, 1757-59 (now Capodimonte, Naples)

painted by Mengozzi Colonna and the work was probably finished in 1757.

The Palazzo Labia, in Venice, was built from about 1720 onwards by Andrea Cominelli and Alessandro Tremignon for the Labia family. Again, Gianbattista Tiepolo frescoed the grand ballroom, which has some very impressive pedimented doorways, window surrounds, and traditional fluted Corinthian pilasters in fluent Palladian language. This architecture was augmented by Mengozzi Colonna's quadratura and left Tiepolo to depict on the ceiling *Genius Putting Time to Flight*, and within the painted arches on the walls his favourite subjects, Antony and Cleopatra, in legendary scenes. Comparison of the Tiepolos with Veronese, the artist whose influence on them was so strong, shows the greater mastery of the earlier painter but also illustrates the shift of style to a lightness in line and colour and the loosening of compositional relationships.

A completely different social structure greeted the traveller in late 17th century Naples and Sicily, and talent in art and architecture was by no means so plentiful. The Kingdom of the Two Sicilies was from 1734 ruled by Charles VII, son of Philip V of Spain and Elizabeth Farnese, known on succession to the Spanish throne as Charles III. In Naples, Ferdinando Sanfelice (1675–1748) was designing churches in the main but also built palaces where intricately planned staircases vied with each other in their elaborate geometry. In the Palazzo Serra di Cassano (1720–38) an entrance staircase starts at ground level with twin flights which twist and turn to form a bridge giving access to the *piano nobile*. This is in a style far distant from anything found further north. Sanfelice and Antonio Vaccaro (1681–1750) continued to design in ecclesiastical Baroque but employed for secular purposes ideas incorporating Rococo ornament. Vaccaro's cloister of S. Chiara convent in Naples (1739–42), executed entirely in maiolica, is of very worldly appeal. Octagonal piers with spiralling vine designs in yellow, blue and green support pergolas with living vines forming a shady roof. The floor tiles of a nearby fountain depict painted fish under water. Following the French example in royal patronage of manufacture, Charles in 1743 started the royal porcelain factory at Capodimonte where, in addition to *objets d'art* and porcelain for domestic use, a Porcelain Room, now in the Capodimonte Museum, Naples, was created for the Palazzo Portici (1757–59), inspiring examples in Holland, Germany and Austria. Some Porcelain Rooms were merely for the display of collections but this one was completely lined with the material, with finely modelled panels of Chinese figures, gilded mouldings, and tall mirrors among Rococo flowers, trophies, birds, and butterflies, more than 3000 pieces of porcelain.

Charles also imported two Rome-trained architects, Ferdinando Fuga (1699–1781) and Luigi Vanvitelli (1700–71) for an extensive public works programme of which much was left unfinished. Outside the Royal Palace at Caserta by Vanvitelli the long flat entrance front demonstrates an abandonment of Baroque spatial values and indicates reconsideration of classicism. Inside, however, the main entrance vestibule and stairs retain not only monumental scale but clearly express movement and drama, a swirling coffered dome over the upper level vestibule which commands a view of the grand axial composition. Versailles was obviously a source of inspiration

as Charles was a grandson of Louis XIV and had seen the palace at first hand. Furnishing in the palace at Caserta (1780) follows Louis XV and XVI styles and provided a gilded bath with gold taps for the queen. Later First Empire furnishing in the Appartamento Nuovo includes magnificent French furniture, a Roman-style stone bath and an alabaster dressing table centred on a pedestal fountain for perfumed water.

Sicilian variants of Baroque and Rococo in Palermo and Catania had, at the end of the 17th century, drawn directly on Roman ideas. The Oratory of S. Zita, Palermo was decorated in 1685–88 by Giacomo Serpotta (1656–1732) in immensely skilful high relief stuccoes. The design encompassed three-dimensional frames recessed to hold deeply modelled scenes of religious subjects, the frames being set against a stucco mock drapery held by numerous putti and ornamented with scrolls, shells, military trophies, and swags of fruit. The centrepiece on the end wall represents the Battle of Lepanto when Christians defeated Turks, and all is naturalistically created to very small scale – a technique used earlier in the century in Palermo Cathedral. The Palazzo Gangi, Palermo by an unknown architect dates from at least 80 years later but is an equally surprising survival of the fantastic Rococo. The ceiling of the Gangi Galleria degli Specchi consists of an inner curved and pierced dome-like stucco framing above which is a second domed surface brightly lit to emphasise its painted scenery by Gaspare Serenario (d.1759). Lavish gilded Rococo ornamentation and dark panels furnish the walls while maiolica floor tiles are painted with scrolls, leopards, and landscapes. Window shutters decorated on the reverse give a continuous decorative scheme when closed. Adjacent rooms complete an unexpectedly sophisticated suite, used as a location for the film *Il Gattopardo*. The *salone* was painted by Elia Interguglielmi who died in 1773.

Another eccentricity, this time in Catania, involves work by Francesco Battaglia at the incomplete Palazzo Biscari. In a preliminary exterior flourish he perched two small square pagoda-roofed pavilions on a conventional terrace and proceeded to decorate the *gran salone* in an effusion of Rococo stucco. The coved *rocaille* ceiling is pierced to form a musicians' gallery, revealing the well-lit painted dome above, full of flying figures. The musicians' staircase is also clad in *rocaille* stucco with an accompanying wrought-iron balustrade in lightweight swirls which might easily be at home in an Art Deco context.

The status of France as leader of taste in the 17th and 18th centuries was supported by interchanges with Italian artistic culture. In the 17th century Bernini had submitted designs for the Louvre, painters led by Primaticcio were employed on the French royal palaces, and French art students maintained contact through their academy in Rome. French Rococo design scarcely outlived the Revolution and classical academicism persisted, ready to inspire the next formulation of principles. Italy's alternative to Rococo concentrated yet again on painting and stucco. The reappearance of classicism – Neo-Classicism – in Italy was spasmodic, and since its use in interiors had never entirely disappeared, it lacked the novelty it afforded the French.

Giovanni Battista Piranesi (1720–78), a Venetian living in Rome, published sets of engravings from 1748 onwards of views of Rome, its antiquities, and the curiously named

Diverse maniere. He came under many influences from the later Baroque period. The Bibienas and the Valeriani brothers were stage designers, Juvarra and Fischer von Erlach were architects and Gian Paolo Panini was a painter and teacher – all of whom could have sparked off the romantic element in Piranesi's vision. Excavations at Herculaneum and Pompeii had begun in 1738 which disclosed previously unknown ancient interiors; these also changed stylistic direction.

J.J. Winckelmann (1717–68), whose study was Greek art and the ideals of “noble simplicity and calm grandeur” and whose influential *History of Ancient Art* was published in 1764, encouraged partisanship in the Greece-versus-Rome argument which he headed as a counterpoise to Piranesi. The enthusiasm at the end of the century for collecting ancient art and sculpture led to the building of new museums in topical versions of the old formula. Papal patronage under Pius VI added rooms to the Vatican Museum, most notably the Sala Rotonda (1776–80), providing a circle of shell-headed niches for antique statues ranged round a central fountain. The Sala delle Muse and the Sala a Croce Greca complete the suite of Neo-Classical rooms by Michelangelo Simonetti (1724–81) whose source of inspiration was likely to have been Herculaneum. Pietro Camporese (1726–81) and his son Giuseppe (1763–1822) both worked at the Vatican Museum on new sculpture galleries (1786), Giuseppe being credited with successful blending of academic background with the current Neo-Classical motifs. A more formal expression of Neo-Classicism was Raffaele Stern's (1774–1820) design for the Braccio Nuovo, the new wing which was built between 1817 and 1822 incorporating a modified interpretation of Winckelmann's principles but described by Georgina Masson in 1965 as “cold nineteenth century classicism”.

In Rome, Carlo Marchioni (1702–86), talented in all aspects of sculpture, engineering, architecture, and design, provided a setting for Cardinal Albani's collection of antique sculpture in the Villa Albani. His facility in a number of design styles reflected Roman love of display but did not inhibit his choice of the Neo-Classical architecture for this purpose.

Napoleon's ventures in northern Italy gave status to Milan as a capital city, encouraging new design and building. The city's principal architect Giuseppe Piermarini (1734–1808) used Neo-Classicism with elegance and skill in extensive works at the Royal Palace, on the design of La Scala opera house, and in the Villas Ducale and Reale at Monza, all principally in the 1780s, although he was criticized by the theorist Francesco Milizia for too much magnificence. Milizia is connected with a later designer, whom he taught and who worked almost exclusively in the Veneto, Giovanni Antonio Selva (1751–1819). Selva was well-indoctrinated by Milizia and also by his extensive travels through Italy with sculptor Antonio Canova whose monuments later became almost synonymous with Neo-Classicism. Works by Selva include the Venetian opera house, La Fenice (1790–92); the Teatro Nuovo, Trieste; Villa Manfrin, Treviso; and Palazzo Dotti, Padua.

Also in the north, the interior of the Palazzo Milzetti, Faenza, built by Giuseppe Pistocchi between 1790 and 1800, places special emphasis on the local traditions of painting, sculpture, and decoration. Felice Giani (1758–1823), experienced in Napoleonic decoration at the Tuileries, Paris, and Malmaison, and accustomed to working in all parts of Italy,

contributed paintings in the Galleria and Sala degli Sposi to achieve, in combination with Raphaelesque stucco work by Antonio Trentanove, one of the finest intact Neo-Classical interiors in the region.

The introduction of the Empire style was approved by the new ruling establishment, many of whom were familiar with the style through close connection with France. Napoleon's Egyptian campaign of 1798–99 focused attention on Egyptian antiquities, and a translation of Baron Denon's account of the expedition was available in Italian by 1808. The inclusion of Pharaohs, pyramids, hieroglyphs, and sphinxes in the Sala Impero, Palazzo Massimo, Rome in Egyptian Revival fashion is an admirable example. Naples under Murat, also from 1808, was the scene of Empire decoration in the Italian manner with the Appartamento Nuovo (1807–45) in the Royal Palace, Caserta containing the Sala di Marte by Antonio de Simone, with extensive use of marble and heroic bas-reliefs as main wall decorations executed by Villareale, Monti, and Masucci. The frescoed ceiling vault of the Triumph of Achilles is by Raffaele Galliano. In the king's apartment the rooms for the king and for Murat have superb canopied Empire beds, carved and inlaid in mahogany and gilded bronze, with accompanying tables, chairs, and commodes. Similar furniture by Percier and Fontaine who exerted such powerful influence on the whole range of Empire interior design had been imported from Paris by Caroline Murat for the earlier old Royal Palace in Naples.

Palermo is the site of a unique building that is almost a folly. The Palazzina della Favorita or Palazzina Cinese on the outskirts of the city, was built in 1799 as a summer villa for King Ferdinando IV and Queen Maria Carolina who had, the previous year, fled from Naples on Nelson's flagship. Allegedly, they acquired the idea of a “Chinese” style from a successful Chinese setting to a banquet they gave for Nelson. The exterior is unresolved, with heavy, plain columns supporting upturned eaves hung with tiny bells, but the real attraction is inside where architect Giuseppe Venanzio Marvuglia (1729–1814) exercised his considerable skill on Pompeian, Turkish, and Chinese rooms, now well restored and glowing with pleasing colour. Comparison with Brighton Pavilion is unavoidable, although the Palazzina was conceived on smaller and more modest lines, entirely lacking in the rich and sophisticated background which the Prince Regent so much enjoyed in Brighton. In the ballroom of the Royal Palace in Palermo (c.1815) the shallow barrel-vaulted ceiling, frieze, pilastered walls, and traditional dado hark back to the Italian Renaissance but a Neo-Classical statement is clearly intended, if not achieved. The heaviness of would-be Empire furniture underlines the decline of a style which owed so much to elegance and crispness of finish.

Also relevant to Italian Neo-Classical design is a study of interiors by Italian architects and decorators at Pavlovsky Palace, St. Petersburg. Giacomo Quarenghi (1744–1817); Vincenzo Brenna (1747–1819) and Karl Rossi (1775–1849) all left oeuvres which, restored after serious World War II damage, provide a body of work including furniture and other contents, equal to any Neo-Classical source in Italy.

After 1815, the eclipse of Napoleon affected fashions in decoration and design and although Italian Neo-Classicism persisted by way of a few substantial examples, it no longer survived as a mainstream style. It had been a product of

Italy: Palazzo Reale, Caserta, Sala di Marte, 1807

imported French culture and although its archaeological basis was not forgotten, the clean-cut academic approach to design was being invaded by more romantic aspirations. Although individual architects were no longer making international reputations, some distinguished buildings were constructed, particularly theatres and opera houses, and town planning received attention on a classical scale even if, as in Florence, such schemes were not completed.

Some painters were able to assimilate a stylistic change of direction. The Bolognese painter Pelagio Palagi (1775–1860), who developed also as architect and designer of interiors and furniture, was in the forefront of this transition. In borrowing from architectural styles of the past, historicism combined in the first half of the 19th century strong romantic and eclectic elements. An interest in literature was translated into three-dimensional substance, the novels of Sir Walter Scott being a popular source. The improvement of communications and resulting spread of ideas gave wide freedom of choice which characterized design styles in Italy as elsewhere for most of the rest of the century. From ancient Roman, Greek, and Egyptian models the field was extended to include Moorish, Gothic, and Oriental, with even indigenous Rococo, Baroque, and

Renaissance design being searched for inspiration as nostalgia took the place of innovation.

Palagi's abilities had been recognized early, and in 1806 Count Aldrovandi sent the young painter to study in Rome. A series of attributed drawings of romanticized Neo-Classical vases decorated with symbolic subjects must have been inspired by Piranesi and indicates further affinity with Giani and Fuseli. In Rome, Palagi worked with Felice Giani on the redecoration of the Quirinale for Napoleon, but his major achievements were for the king of Sardinia, Carlo Alberto, for whom he improved two royal palaces in Turin. In the Castello at Racconigi, about 40 kilometres to the south, Palagi began to design in 1832 a fine bathroom on the ground floor and rooms with their furnishings for the *piano nobile*, incorporating a reception hall, an Apollo Study, and an Etruscan Cabinet. The Etruscan Cabinet was one of his greatest successes, carried out with help from Carlo Bellosio, with frescoed ceiling, coved frieze, and wall panels, dark backgrounds, and gold or yellow figures. Palagi's fine drawings for furniture show derivation from Percier and Fontaine with caryatids, lion heads and palmettes much in evidence. He favoured the use of bronze to obtain a fine finish, employing French and Milanese foundries

for the work. Another source of French influence was through E.A. Petitot who had enlarged the vocabulary of ornament taken from both ancient and recent periods. By this time Palagi had amassed a substantial collection of antique art which is now in the municipal collections at Bologna.

Palagi's interiors at the Royal Palace in Turin (1835–57) expanded into rich Neo-Renaissance treatments with Corinthian orders and coffered ceilings. Robust carving and gilding with heavily draped curtains and brilliant chandeliers accomplished the transition into a mid-century style which in Britain would be described as Victorian. The Ballroom contains ceiling panels painted entirely by Palagi who also designed carved doors for the Council Chamber which were carried out by Capello, Ferrero, and Marielloni. The elaborately carved gilt furniture in this room shows Palagi's most eccentric vein, but his fertile imagination restored some of the status Italian design had possessed at the time of Juvarra. The staircase of the Palace was redecorated for Vittorio Emanuele II in 1864–65, dominated by a statue of Carlo Alberto by Vincenzo Vela in a Renaissance-type niche and tabernacle and supported by stuccoes and paintings which celebrated the history of the House of Savoy.

The popularity of cafes and restaurants presented opportunities for smaller-scale work catering for a wider public. Turin's Ristorante del Cambio was elegantly renovated by Lorenzo Panizza in 1850 and a cartoon of Cavour still exists above the table where he used to sit, marking the move towards Italian unity which took a further 20 years to achieve. The Caffè Pedrocchi in Padua (1816–31), designed by Antonio Gradenigo (1806–84), and Giuseppe Jappelli (1783–1852), a pupil of Selva, is a Neo-Classical building of character. It was extended on ground and first floors into Egyptian, Etruscan, Moorish and Gothic rooms, with a finishing touch in the Sala Rossini of painted harps above gold-starred walls. According to one historian, it was "the handsomest 19th-century cafe in the world".

The interior of La Scala opera house in Milan was redecorated in 1830 by Alessandro Sanquirico (1774–1849) in a white and gold scheme, anticipating the Late Empire Throne Room at Caserta (1839–45) by Gaetano Genovese (1795–1860), assisted by Angelini and Tommaso Arnaud. At the same time Genovese was extending and remodelling the Royal Palace in Naples, also for Ferdinand II.

Little pioneering work marked Italian interiors in the troubled political climate leading to unification in 1870, after which the new Kingdom of Italy required far fewer royal palaces. The glazed galleries or arcades made possible through advancing technology, although not strictly ranking as interiors, housed shops and other urban facilities in a novel way. The Galleria Vittorio Emanuele in Milan, dating from the 1860s, is probably the best-known with its cruciform plan and central glazed dome designed by Giuseppe Mengoni (1829–77), and its carefully detailed arcades below long curved glass roofs. Genoa competed, with an even longer Galleria Mazzini (1871) and both were important achievements in the use of glass and iron to define enclosed space.

Representing an entirely opposite design approach is the Palazzo Municipale in Padua (1880). The architect Camillo Boito (1836–1914), was an enthusiast for medieval studies, but this building can only be called eclectic, combining

Rundbogenstil and Pompeian features as well as Gothic. It succeeds in conveying a feeling of vigour absent in much contemporary Italian architecture. Further historicism in the form of Moorish extravagance deriving from the Alhambra, surfaced in the Villa Panciatichi (c.1875), previously the Castle of Sammezzano at Rignano sull'Arno, with much coloured tile work, fretted screens, and Moorish arches alongside fan vaulting and ogee pediments. Upholstered divans were covered with Genoa velvet and damask, gestures towards the prevalent idea of comfort even in such an eccentric setting.

A new and expressive form of architecture and decoration appeared at the end of the 19th century. The obsessive massing of clutter on every available surface was diminishing and ostentation was being replaced by more domestic amenities, made practicable by improvements in technology. The long-cherished language of fresco had given way to patterned papered walls hung with gilt-framed oil paintings or watercolours and mirrors. Fitted carpets were an accepted floor covering, particularly in the north, and curtains took an important place in middle-class interiors. Surviving domestic backgrounds for Cavour, Manzoni, Verdi, and d'Annunzio all breathed such atmosphere of convenience and comfort, as also does the small bedroom of Pope Leo XIII in the Vatican, although he did have immediate access to grander spaces in his Torre Leonina with eclectic interiors designed and painted by Ludovico Seitz in the 1880s.

Italy took its place in Art Nouveau history by staging the highly successful Turin Exhibition of 1902. The style had acquired national variations in character, but the emphasis at Turin was on the flowing line and naturally-derived shapes of flowers and plants. A contradiction of this trend was the mannered work with a touch of brutalism by Carlo Bugatti (1856–1940) in his disc-backed chair and in the snail-shell motif of his Snail Room design. The firm of Ceruti in Milan which employed Gaetano Moretti, and Eugenio Quarti, a Milanese cabinet-maker, had exhibited Mackintosh-inspired furniture with inlays of mother-of-pearl, silver, and gilt bronze at the Paris Exhibition of 1900. Ernesto Basile designed in a more severe vein for the Ducrot furniture firm in Palermo. Mackintosh's Scottish influence shows again in Antonio Tagliaferri's design for the Santa Teresa Pharmacy in Milan, well-preserved in an equally interesting Art Nouveau building of 1905. Few of the more orthodox Art Nouveau interiors remain, but among them is the Casa Fenoglio, Turin by Pietro Fenoglio (1903), deriving from Victor Horta and displaying good woodwork, coloured glazing, and metal balustrading. Italian work tended to be more restrained than French or Belgian examples and to use geometric curves more than the free whiplash motifs usually identified with the style.

A little-known Art Nouveau survival which continued under construction long enough to break into riotous Art Deco is the spa of Salsomaggiore Terme near Parma. The two main centres of interest in the town are the Grand Hotel des Thermes (begun 1901) designed by Luigi Broggi and now the Palazzo dei Congressi, and the Terme Berzieri, the amazing spa building itself (1914–23), under architects Giulio Bernardini and Ugo Giusti. The hotel, still a fine example of the Stile Liberty, synonymous with Italian Art Nouveau, provided 300 bedrooms for international royalty, rulers, and society. Alessandro Mazzucotelli, one of the finest decorative metal-

Italy: Lord Battersea's bedroom, London, by Carlo Bugatti, c.1901; photograph by James Hyatt

work artists, executed the hotel's entrance canopy metalwork in the contemporary style he was also using in Milan. Gottardo Valentini was responsible for interior painting in *stile floreale* in which he was not entirely at home but he progressed to more confident work for the Terme at San Pellegrino and the Gambrinus Cafe, Milan. Mazzucotelli's other work included electric light fittings for the Palazzo Castiglione, Milan (1901–03), designed by the well-known architect Giuseppe Sommaruga (1867–1917), for his engineer friend Ermenegildo Castiglione. It was in *Stile Liberty* throughout, introducing asymmetric accents into a basically symmetrical classical plan. Interior surfaces were enriched by juxtaposed texturing and animated by decorative figures and plant forms. Nudes were removed soon after completion for modesty's sake.

The Terme Berzieri spa at Salsomaggiore represents above all a triumph of close collaboration between architect Ugo Giusti (1880–1928) and decorative designer / painter Galileo Chini (1873–1956) after Bernardini's retirement. Chini was

also artistic director of the Chini Ceramics Works and this connection played a substantial part in determining much of the character of the Terme Berzieri decor. Marble, travertine, faience, maiolica, coloured glass, and iron, not forgetting mural painting and stucco, were all assembled, often in zoomorphic forms, with oriental symbolism which possibly represents a search for health and fertility. Overtones of Gustav Klimt and the Viennese Secession are evident but inventiveness and quality are not always consistent. After completion of the Terme building the partnership worked on extending the Grand Hotel des Thermes from 1924–27 where accommodation was needed for gala entertainments. Chini was well attuned to oriental influences, having spent three years in Bangkok from 1911 onwards, and he now blended this experience with an interpretation of the Alhambra based, in all probability, on the earlier one he could have visited at Sammezano. Much of the frescoed decoration was painted by Chini himself and has since been restored. There is also a Sala

delle Cariatidi where Chini covered earlier painting by Gottardo Valentini, and the Red Tavern bar, with matching reddish lacquered furniture made, along with some striking chandeliers, by Franco Spicciati in Lucca.

The consolidation of Art Deco at the 1925 Paris Exposition Internationale des Arts Décoratifs et Industriels Modernes indicated once again the lead held by France. Italy was less sympathetic to Art Deco than it had been to Art Nouveau, and although its recognized idiom was used to fit out some lavish rooms, these followed rather than led the style. Milan was the centre of much of the Art Deco which appeared, but no great upsurge materialized. G.B. Gianotti in the 1920s designed an interesting dining room with adaptations of Neo-Classical volutes and anthemions; Tomaso Buzzi started the 1930s with a mix of slightly Cubist, slightly oriental bedroom furnishings, and Gigiotti Zanini in 1933 made opulent use of geometric and sunburst motifs. Franco Albini followed the trend for built-in furniture and unusual colour combinations when designing for aviator Arturo Ferrari a dressing room introducing some Modernism and combining brown and yellow striped silk with pink lacquering on the dressing table, pink silk, and a large zebra-skin pillow on the sofa.

The growth in Germany of the Modern Movement and the Bauhaus made little impression on Italian design before the International Style was appropriated by the Fascist Party in the 1930s. Clean lines, tubular steel, glass, and abstract wall decoration by Giuseppe Terragni for the conference room in the Casa del Fascio, Como (1932–36) announced a new departure, but the mixture of politics and aesthetics was short-lived.

Post-war reconstruction absorbed Modernist ideas which also took in Le Corbusier and Frank Lloyd Wright. Design was rethought in terms of straightforward production of homes to remedy war damage. However, interior design received some stimulus from London's Festival of Britain exhibition in 1951 and simultaneously designers in Italy were applying revived Internationalism with elegance and flair. Milan again became a focal point and the centre of a booming industry manufacturing domestic furniture and fittings, employing first-rate designers, with great success in the export market. Names such as Nervi, Ponti, Fornasetti, and Magistretti appeared in international periodicals and good design had become news. *Domus* magazine, founded and edited by Gio Ponti (1891–1979) had helped to widen the market, spreading the language of plain wood, deep-textured rugs, uncluttered shelving and storage units, and areas of strong colour. Ponti's furniture designs were manufactured by the firm Cassina, as were those by Vico Magistretti and Mario Bellini. Ponti and Fornasetti worked together on commercial and domestic interiors which often incorporated wittily printed patterns on hard and soft materials, as in the Appartamento Luccano, Milan, 1950 where silk curtains carried printed patterns of manufacturers' labels and silk-upholstered chairs were covered with book-backs and mock woodgrain prints. A "casa di fantasia", illustrated in a 1952 *Domus* issue, contained elaborate Fornasetti iconography of the antique gods. Small painted ceramic panels by Romano Rui and a mirror door decorated with the Bacchus story by the distinguished artist Edina Altara both represented Italian traditions.

Despite the eminence of Milanese designers and manufacturers, Italy failed to maintain its leading position of the 1950s

for long. Speed of communication meant speed of fashion trends and an ethos of disposable furniture and entire interiors made a brief appearance. The architect / designer Andrea Branzi (b.1938) led the Archizoom group in Florence in 1966 to break away from the American and Scandinavian influenced mainstream "Contemporary" style, mixing Art Deco and Pop Art in an attempt to attract young buyers who would spend for amusement on fake fur and cardboard chairs. They also sampled Deconstructivism and experimented briefly with other interior fashions. A "green" conservation philosophy in the next decade slowly affected views on design which were also accommodating computerization and High-Tech construction methods.

Two Italian design groups attracted special attention following the 1972 New York exhibition, Italy: The New Domestic Landscape. The exhibitions had commissioned designers Ettore Sottsass (b.1917), Mario Bellini (b.1935) and Joe Colombo (1930–71) to create micro-environments. Their minimum space modules exhibits offered flexibility and new techniques for instant changes of lifestyle. Ponti's successor as *Domus* editor, Alessandro Mendini, formed the Studio Alchymia, Milan, in 1976, which Sottsass then joined and which, with its personnel of young, avant-garde designers, was funded by Artemide on a serious commercial basis. Their stated inspiration combined performance art, left-wing politics, and bizarre furniture but they nevertheless produced exciting designs. Soon Sottsass left the Studio to form his own independent Memphis Group which exhibited for the first time at the 1981 Milan Fair. Bright nursery colours, plastic materials, and zany ideas, made immediate appeal and the Carlton room divider shown at the Fair was instantly confirmed as a Memphis icon.

Having been overtaken by British, American and Japanese designers, the position of Italy in Modern and Postmodern design today gives some cause for concern, and a degree of conservatism based on revivalist styles seems to be gaining influence among the more up-market interior decorators. The concept of integrating interior and exterior design seems to be losing ground – a problem Palladio would have appreciated.

J

Jackson and Graham

British cabinet-makers and upholsterers, fl. 1836–1885

Jackson and Graham were arguably the most important, and certainly the most publicised of any of the high Victorian cabinet-making firms. Listed as in business by 1836, the firm occupied premises at 37 Oxford Street in the heart of London's West End, and specialised in furniture that was aimed at the luxury end of the market. They were best-known for their elaborate and finely wrought French and Renaissance-style cabinets, decorated with marquetry or ebony inlaid with ivory, that were exhibited to high acclaim at numerous International Exhibitions. Several of these pieces were designed by prestigious architects such as Bruce Talbert. Their in-house designers included Peter Graham and Alfred Lorimer and they were one of the first London establishments to employ a foreign designer, the Frenchman Eugène Prignot who worked for the firm from 1849. By the mid 1870s they were also providing a complete interior decorating service and had commissioned a range of oriental-style carpets, wallpapers, curtains and other furnishings from Owen Jones.

Prignot was responsible for Jackson and Graham's first prize-winning cabinet at the Crystal Palace exhibition of 1851. For much of this period French designers were generally perceived as superior to their British counterparts and, encouraged by Jackson and Graham's lead, numerous other firms began to use their services. Indeed, by the International Exhibition of 1855, the influx of foreigners engaged by London firms prompted Matthew Digby Wyatt to declare that "it is a subject for congratulation that foreigners of such talent should be at work among us" and their influence was widely thought to have raised standards of design. Jackson and Graham's entry in the 1855 exhibition was a cabinet designed by Prignot in the florid Louis XVI style. The scale, elaboration and opulence of this work epitomised the design of successful Victorian exhibition pieces. It was made up of two parts; the upper part comprised a vast mirror enclosed within an ornate, columned, carved wooden frame, and the lower section contained the cabinet and was decorated with sculpted figures made of gilt cast brass. No fewer than 40 modellers, gilders, metal-chasers and other craftsmen, including the Italian carver Claudio Colombo, were involved in the execution of this work; the brass castings were made in Birmingham and the porcelain

plaques were decorated by the Minton firm. The cabinet was hailed by Wyatt as being "the first really noble piece of cabinet-makers' work involving excellence in all the most difficult processes of the manufacture which has been executed in this country". The firm was awarded a Gold Medal of Honour and the cabinet was subsequently purchased for the nation by the South Kensington Museum for £2000.

Jackson and Graham's entry in the 1867 Paris Exposition Universelle was designed by Alfred Lorimer. While the majority of British firms preferred light finishes involving satinwood and gold, this piece was made of ebony. Wyatt felt that the exhibit was "the finest in the exhibition: richly inlaid with ivory, lapis lazuli and excellently engraved". A similar cabinet was shown at the International Exhibition of 1871 where, once again, it was lauded as "one of the most superb pieces of decorative cabinet work".

Bruce Talbert's *Juno* cabinet was designed for the firm's stand at the Paris exhibition of 1878. Made in ebony inlaid with ivory, this piece reflects the influence of fashionable Aesthetic styles. The structure is strongly geometric with an emphasis upon vertical and horizontal lines and the decoration includes classicising details and a pedimented frieze containing representations of Juno and Minerva. It also displays the two leitmotifs of Aestheticism, namely the peacock in the centre of the pediment and lilies in the door panels in the base. Another highly acclaimed design, it was awarded a Grand Prix and was purchased by the Viceroy of India before ultimately arriving at the Victoria and Albert Museum.

Although these exhibition pieces did much to enhance the reputation of the firm as a leader in luxury furnishings, the individual items themselves were produced mainly for show and Jackson and Graham's commercial success rested more firmly on the popularity of their less elaborate furniture and their carpets and wallpapers, several of which were designed by Owen Jones. Jones also re-designed their shop front in 1867 and collaborated on a number of interior projects including a billiard room for James Gurney in Regent's Park of c.1870 and the hugely prestigious commission to furnish and decorate the Palace of the Khedive (Viceroy) at Cairo.

As business grew the company expanded and by 1880 they were occupying larger premises that took in the whole of nos. 29 to 38 Oxford Street. By this time, too, they had increased their range of activities to include every aspect of house furnishing and decoration and they provided the furniture and

fittings for a number of London restaurants in the mid 1870s. They also offered services that ranged from house letting, appraisals and sales, to the storage of contents.

An article in G.P. Bevan's *British Manufacturing Industries*, written by J.H. Pollen in 1876, describes Jackson and Graham as a typical example of a successful furnishing firm. The article describes the range of operations undertaken at their Oxford Street premises and notes the construction of "an elaborate cabinet of marquetry in patterns of Oriental character, after designs by the late Mr. Owen Jones". By this time Jackson and Graham were one of the largest furniture-making businesses in the country, employing between 600 and 1000 hands, depending on the pressure of work at different times of the year, and had a weekly wages bill of close to £2000. They were also one of the first British firms to use machinery, introduced in the 1850s, and in 1862 they advertised that they were "fitted with all means and appliances to ensure superiority and economise cost". Nevertheless, the company was not always beyond reproach, and in 1873 the *Furniture Gazette* criticised "a bedroom suite of furniture painted black, relieved with white etc., in stripes which we consider in bad taste. Black is a most objectionable colour for a bedroom and when it is striped like the panels of a cab, it makes the matter worse". In 1881, however, they were commended by the *Builder* for their "production of cheap furniture of artistic design" which "endeavoured to meet the requirements of those who cannot afford to furnish their houses in Italian, French or Chippendale furniture." And the writer continues, "They are making some very excellent buffets and other furniture of exceedingly simple design, the lines of the framework being relieved by plain flutings and moulded work ...[as well as]... suites of bedroom furniture, made in pine and stained green with black mouldings; some excellent painted bedroom furniture all produced by machinery at reasonable cost." This furniture represented a departure from their earlier French and Renaissance styles and was clearly stimulated by the fashion for Artistic styles promoted by rival firms such as William Watt, James Shoolbred & Co., and Collinson and Lock. The attempt to enter more mainstream commercial markets did not, however, solve the financial problems that had begun to beset the firm, and in 1885 they were taken over by Collinson and Lock who were in turn absorbed by Gillows in 1897.

Selected Collections

The principal collection of Jackson and Graham furniture is in the Victoria and Albert Museum, London, which includes Eugène Prignot's 1855 cabinet and Bruce Talbert's *Juno* cabinet of 1878; the museum also holds examples of the firm's wallpapers designed by Owen Jones. An album of sketches and designs for decorations and interiors for Jackson and Graham attributed to Jones is in the Whitworth Art Gallery, Manchester.

Jacob / Jacob-Desmaller Family

French furniture makers, c.1765-1847

The Jacob dynasty spanned eighty years of activity from Georges I (1739-1814) to Georges Alphonse (1799-1870). Georges I, the founder, was born at Cheny of Burgundian parentage, but he soon left for Paris where he was apprenticed to Louis Delanois (1731-92), who is said to have been one of the first Parisian chair-makers to adopt the Louis Seize style. A pair of armchairs illustrated by Svend Eriksen from a suite dating from c.1770 are stamped with the names of both Delanois and Jacob; at that time the former is said to have been turning out around 2000 pieces a year (Eriksen, 1974).

Jacob became a *maître menuisier* in 1765, and he was soon being employed by such fashionable clients as Mme. Geoffrin. He was one of the few superior 18th-century craftsmen to work both in *menuiserie* (carving from the solid wood) and *ébénisterie* (veneered furniture). In 1781 he was appointed "chair maker in ordinary to Monsieur" (i.e., the Comte de Provence, later Louis XVIII). Among the furniture in the Louvre is an armchair, a part of a suite made for the Comte in 1785; they are painted *lilas clair ... rechampe en blanc*. In 1782 Jacob's gilded *lit à la romaine* made for Carl August Herzog von Zweibrücken-Burkenfeld, was a sensation when it was exhibited in his workshop before being delivered to Schloss Karlsberg. In 1786 he became *fournisseur des Menus Plaisirs*, which gave him a place in the Royal Household, and in the following year he made a suite of chairs, stools and tables for Marie-Antoinette's *laiterie* at the Château de Rambouillet from designs made by Hubert Robert, the painter of ruin scenes; they were described as *du genre étrusque* and anticipate by many years some of the Jacob firm's later designs.

Georges I is credited with introducing the sabre leg c.1790 and the use of mahogany for chair-making in France. There is an element of fantasy in some of his designs, such as the chairs made for the Duc de Choiseul which were probably intended for his pagoda at Chanteloup; but on the other hand a large number of chairs were supplied by him before the Revolution to Fontainebleau and the Tuileries for anterooms and the

offices of minor officials, and these show a simplicity and elegant utility which point the way to the Directoire taste. The collection of the Queen includes beds and chairs made by Jacob, including a number of the so-called *fauteuils à l'anglaise*, mahogany chairs with pierced backs enriched with gilt bronze beadings.

In 1796 Georges I made over the business to his two elder sons. Georges II took over the administration and François-Honoré-Georges, who added the name of Desmaller (a family property in Burgundy) to that of Jacob, became the artistic and technical director. The firm took the name of Jacob frères and continued to work from the building in the rue Meslée which Georges I had acquired in 1775. The Revolutionary years had brought disaster to furniture-makers who had lost their patrons, and in 1791 the old guilds, including the *ébénistes* and *menuisiers*, were abolished. However, the Jacob frères survived, and during the Consulate and the Empire they enjoyed great patronage which began when the then-General Bonaparte took a house in Paris in the rue Chantreine, which the Jacobs decorated and furnished. This introduction to the future Emperor led to the important commission to work with his favourite architects Percier and Fontaine, at Malmaison, furnishing it in the elegant Directoire style with some military additions. At the same time in 1799–1800 they were employed to furnish the empty apartments in the Tuileries in a suitably grand style.

Georges II died in 1803 and left Jacob-Desmaller to direct the firm's fortunes and use his own stamp alone on the vast quantity of furniture he was producing. At that time they had sixteen workshops, which covered the complete range of trades -- for joinery work in buildings and in furniture, figure carving, ornamental carving, turning, painting and gilding, veneering, inlaying, polishing, bronze founding, moulding, and locksmiths' work. In his survey of the firm, Serge Grandjean, quotes a document in the Archives Nationales which reveals that in 1807 Jacob-Desmaller was employing 350 workmen and that one third of the firm's output was for export (Grandjean, 1966). By 1810 the number of workmen had apparently risen to nearly 800.

The great years of the Empire produced more orders for refurnishing the palaces at Compiègne and Fontainebleau, Versailles and the Tuileries, and a great quantity of fine furniture, including most of the famous pieces which figure in any account of Empire furniture, was made by Jacob-Desmaller, who enjoyed the Emperor's confidence and special patronage. After the first rush of orders leading up to Napoleon's coronation, there was a second when he married Marie-Louise in 1810. Even so Jacob-Desmaller was declared insolvent in 1813. However, he recovered and after complaining that this setback was largely due to the Continental blockade which was ruining his business, the Emperor issued a decree allowing the firm to trade with England, even though the two countries were at war. This allowed Jacob-Desmaller to increase his export trade through such middlemen as Dominique Daguerre who supplied furniture to the Prince of Wales. Jacob pieces went as far away as Brazil.

The firm continued to be successful during the post-Empire years. Jacob-Desmaller retired in 1825 when his son, Georges Alphonse, who had trained as an architect under Charles

Percier, took over the business. In his first year he supplied a cylinder-top desk to George IV (now at Buckingham Palace), elaborately veneered in satinwood and purplewood with gilt bronze ornaments and very much in the Percier-Fontaine style. He was still working in the Empire style in 1837 when he made a pair of night tables for Queen Marie-Amelie to complement her bedroom in the Grand Trianon at Versailles, but at the same time he provided an *étagère* with fretted panels and turned balusters in a more eclectic taste. Georges-Alphonse directed the business until 1847 when he handed over to Joseph-Pierre-François Jeanselme, who then took his place among the leading *ébénistes*.

Selected Works

The Jacob family's more important commissions included furniture for the châteaux of Malmaison, Compiègne, Fontainebleau, Versailles and the Tuileries. Notable collections of their work are in the Musée du Louvre, Paris, Buckingham Palace, London, and *in situ* at Compiègne, Fontainebleau, and Versailles.

Jacobsen, Arne 1902–1971

Danish architect and designer

A pioneer of Danish functionalism, the architect Arne Jacobsen was one of the best-known and most highly esteemed exponents of the modern International Style. He was responsible for many of Denmark's most celebrated modern buildings and, a firm believer in the integration of architecture with interior design, he often also exercised overall control of the fittings and furnishings within his buildings. He designed furniture, flatware, glass, lighting and textiles, and several of his chairs are now widely regarded as classics of 20th century Modernist design.

Born in Copenhagen in 1902, Jacobsen trained as a mason

Jacobsen: *Ant* chair, 3-leg version

before studying architecture at the Royal Danish Academy of Fine Arts from which he graduated in 1927. He worked in the office of the city architect Poul Hansen from 1927 to 1930, and established his own architectural and design practice in Copenhagen in 1930 where, apart from a short period during the war years, he remained active until his death. He was also active as a teacher and was professor of architecture at the Academy of Arts from 1956.

A participant in the 1925 Paris Exposition des Arts Décoratifs et Industriels, Jacobsen was strongly influenced by the work of Le Corbusier, Walter Gropius and Mies van der Rohe. These influences were manifest in the project for a House of the Future that he exhibited at the Danish Building Exhibition in 1929. The house was a bold circular two-storey structure, and the uncompromising modernity of Jacobsen's approach was evident not only in its design but also in the provision of contemporary facilities such as garaging for cars and a helicopter landing pad. The Bauhaus inspiration is even more marked in the Rothenborg House that he designed the following year and in his designs for the Bellevue Housing Development where he provided furniture and fixtures for the theatre, restaurant and public swimming pool. While still at the Copenhagen Academy Jacobsen formed a life-long friendship with the Swedish architect Gunnar Asplund. Asplund's influence was evident particularly in the more expressive version of Modernism that Jacobsen embraced in the late 1930s and 1940s which combined details and materials used in

traditional Nordic architecture with the simplicity and precision of the International Style.

Following the German occupation of Denmark, Jacobsen fled to Sweden in 1943 where he remained until 1945. During this period he continued to produce furniture and began designing textiles, glassware, lighting and tableware. His textiles were designed in collaboration with his wife, Jonna Jacobsen, and the patterns exhibit a strong element of naturalism.

During the post-war period, Jacobsen's architectural work became infused with influences from the industrialised European nations and the United States. At the same time, a new style was emerging in Danish furniture design. The architect Finn Juhl propounded the view that as well as being functional, furniture should have a sculptural quality. Jacobsen was also becoming interested in new materials and methods of production, and from 1950 he began designing furniture for mass production. His light, plywood and tubular steel three-legged stacking chair was conceived for factory production. The back and seat, moulded from one piece of plywood, clearly shows the impact of earlier examples by Charles and Ray Eames, yet the character of the design remained distinctively Scandinavian. The chair was named the *Ant*, after the sculptural form of the back; in Germany it was known by the nickname, the *Violin*. Its overall lightness meant that it was easy to move and stack, and its modest cost and simple maintenance made it especially popular for public seating areas such as restaurants and airports. It was subsequently produced in several different versions; some included arms and castors, but the most important modification was the addition of a fourth leg and the introduction of colour on the back. The *Ant* chair was awarded a Grand Prix at the 1957 Milan Triennale and, like Eero Saarinen's *Womb* chair, and the Eameses' *Shell* chairs, it has become closely identified with its creator. The *Ant* series has been in continuous production by A/S Fritz Hansens, who have manufactured all of Jacobsen's furniture designs, since 1955.

Many of Jacobsen's other chairs illustrate a similarly sculptural quality which, nevertheless, does not lessen their strongly utilitarian character. The *Swan* and *Egg* chairs were originally designed for the SAS Royal Hotel in Copenhagen (1958–60). This glass-sheathed building, reminiscent of Skidmore, Owings and Merrill's Lever House in New York, represents one of Jacobsen's most important and best-known architectural commissions for which he designed not only the exterior but also all the interior fittings and furnishings. A similarly complete commission was his design for St. Catherine's College, Oxford (1960–64), where he devised every detail of the interiors including the lighting, textiles, cutlery and tableware. Both projects exemplify his ideal of the building as a total work of art.

Jacobsen's *Egg* chair has a fibreglass seat shell, upholstered in foam and covered in fabric or leather, supported on a swivelling star-shaped base of cast and polished aluminium. It also has an adjustable tilting mechanism and is accompanied by a footrest to enhance comfort; designed in 1959, it is still in production today. In contrast with the *Egg*'s high, curving back which almost completely encases the sitter, the *Swan* is a more horizontal design with armrests in the form of bird's wings, outstretched as if for flight. Both chairs underline Jacobsen's

ability to rupture conventions, but in so elegant and understated a fashion that their radicalism is barely noticeable. His work exemplifies the aim of many 20th-century Modernists to create a modern yet comfortable chair whose design complements the shape of the human body. He was also typically Scandinavian in his love of organic forms, natural materials, and nature generally from which he drew much of his creative energy. And his designs for furniture, lighting, glassware, tableware and other domestic items resulted in the production of many design classics that have been compared to works of art. The fact that these items were for everyday use and sold at affordable prices has greatly enhanced their influence on domestic interior design.

PIA MARIA MONTONEN

Biography

Born in Copenhagen, 11 February 1902. Studied at the School of Applied Arts, Copenhagen, graduated 1924; studied architecture at the Royal Danish Academy of Fine Arts, Copenhagen, 1924–27. Married the textile designer Jonna Jacobsen: two sons. Worked in the office of the city architect Poul Hansen, Copenhagen, 1927–30; private architectural practice, Copenhagen, 1930–71. Lived in Sweden, 1943–45. Designed furniture from 1932; textiles, glassware, lighting and tableware from 1943: designed for Graucob Textilén, August Millech, C. Olesen, A. Michelsen, Fritz Hansen, Louis Poulsen Company and others. Professor of architecture, Royal Danish Academy of Fine Arts, 1956–71. Received many prizes and honours including Silver Medal, Paris Exhibition, 1925, Eckersberg Gold Medal, Royal Danish Academy of Fine Arts, 1936, medal of honour, Danish Architectural Association, 1962, and gold medal, Académie d'Architecture de France, 1971. Honorary Corresponding Member, Royal Institute of British Architects; Honorary Fellow, American Institute of Architects. Died in Copenhagen, 24 March 1971.

Selected Works

Interiors

- 1929 House of the Future, Danish Building Exhibition, Copenhagen (building and interiors with Flemming Lassen)
- 1930–31 Rothenborg House, 37 Klampenborgvej, Copenhagen (building and interiors)
- 1937 Bellevue Theatre and Gammel Bellevue Restaurant, Copenhagen (buildings, furniture and fittings)
- 1937 Jacobsen Country House, Gudmindrup Lyng, Denmark (building, interiors and furniture)
- 1937–38 Stelling House, Gammel Torv 6, Copenhagen (building and interiors)
- 1938 Thorvald Pedersen's House, Klampenborg (building and interiors)
- 1940–42 Town Hall, Søllerød (building, furniture and fittings; with Flemming Lassen)
- 1948 Poulsen and Company, Copenhagen (office interiors and furnishings)
- 1952–56 Munkegaard School Vangedevej, Gentofte (building, furniture and fittings)
- 1955 Town Hall, Rødovre (building, furniture and fittings)
- 1955 Jespersen and Son Office Building, Copenhagen (building and interiors)
- 1956 Jurgensen House, Vedbaek, Copenhagen (building and interiors)
- 1957 "Round" House, Sjellands, Odde (building, interiors and some furniture)
- 1958 Town Hall, Glostrup (building, furniture and fittings)
- 1958–60 SAS Royal Hotel and Air Terminal, Copenhagen (building, furniture and fittings)
- 1960–64 St. Catherine's College, Oxford (building, furniture and fittings)
- 1962–69 Hamburgischen Elektrizitätswerk, Hamburg (building and interiors)
- 1966–78 National Bank of Denmark, Copenhagen (building and interiors Hans Dissing and Otto Weitling)
- 1970–73 Town Hall, Mainz (building and interiors with Otto Weitling)

Jacobsen's design work included textiles and wallcoverings for C. Olesen Company (1942–43); furniture for Fritz Hansen Company (from 1932) including the *Ant* chair (1951–52), *Egg* chair (1959), and *Swan* chair (1959); lighting fixtures produced by Louis Poulsen Company (from 1955); silver and stainless steel for A. Michelsen (from 1957); and *Cylinda* tablewares for Stelton Company (1962).

Japan

To understand the basic principle that underlies Japanese interior design, it helps to keep in mind the words of the legendary founder of Chinese Daoism, Laozi, who maintained that "the reality of a building is not the roof and the walls but the space to be lived in." Over the centuries, Japanese architects have followed this principle in the construction of both religious

Japan: narrative picture scroll showing scene known as *yadogiri*, from the *Tale of Genji* scroll, Heian period, 12th century

architecture, such as temples and shrines, and secular buildings, including palaces, castles and the homes of people of all classes. Using wood, bamboo and paper as their principal working materials, they have produced buildings which on the outside are plain and austere enough to blend with their natural surroundings, while on the inside show a deep reverence for the space they enclose.

Traditionally, Japanese buildings are not large, but their relative emptiness and the easy mobility of the various furnishings, create a sense that space is not something static, but somehow alive and changing. A typical Japanese room contains relatively little furniture and wall decoration, a fact that caused many Westerners visiting Japan from the late 19th century onwards to label them stark, austere and uncomfortable. What furnishings there are – futon mattresses, cushions, screens and the like – are generally light and portable, and when rearranged or removed, transform the size, form and nature of the room; a living room becomes a bedroom, for example.

Sliding doors, made from wood and paper, separate the rooms and are often all that stands between the interior of the building and the garden outside. These doors are easily detached, allowing an expansion and contraction of the space within the building, and, in addition, opening up the interior to the world outside. Unlike many cultures, where space is divided up by solid walls, creating a sharp distinction between “inside” and “outside”, in traditional Japanese buildings space is a flexible concept, and no real differentiation exists between interior and exterior space.

A high regard for natural materials also characterizes Japanese architecture and interior design. Wood, of which the Japanese islands have plentiful supplies, has always been Japan’s chief building material, and is ideal for constructing the airy buildings necessary in this hot and humid country. Traditionally, Japanese buildings have been constructed around a large, strong central wooden pillar, sunk deep into the ground and supporting the roof and walls. This ensured that during the earthquakes that regularly rock Japan, only the central pillar swayed with the movements of the earth, with the rest of the house being suspended and thus protected from the shock.

The Japanese have never attempted to cover up this central pillar or any other of the structural elements of the building, choosing to leave the wood, bamboo, reed, or clay walls in

their natural state, perhaps out of gratitude to the materials for their protective qualities, but more likely in appreciation of their inherent beauty. Left exposed, the pillars, beams, lintels, and other elements which make up the interior of a Japanese home, create a wealth of textural variation as well as a mass of horizontal and vertical wooden lines that divide up the surfaces of the room. This linear effect extends to the floor, which is made up of several rectangular straw *tatami* mats, their dark borders dividing the floor into a rhythmic patchwork. Bright colours are very rare in a Japanese interior, the most predominant tones being different shades of brown and grey and the white of the paper doors and windows.

The earliest form of secular buildings constructed in Japan were the shallow pit dwellings of the prehistoric Jomon Period (10,000–300 BC). These pits were dug two to three feet into the ground, with four posts planted into the ground, supporting four horizontal beams, rafters and a ridge pole. Onto this frame was placed a great thatched roof, made from grass bark and leaves, which reached right down to the ground. Inside was an open hearth for warmth, with the only light entering through a small hole which served as a doorway and some ventilation gaps below the roof. Inhabitants spread straw husks on the floor for sitting and sleeping.

During the Yayoi period (300 BC–300 AD), when rice cultivation was introduced from the continent to Japan, inhabitants shifted towards wetter regions of the country and, although pit dwellings were still common, the wealthier members of society began to construct houses on a raised floor, with large gabled roofs, similar to the raised-floor houses of Southeast Asia. These dwellings were single cells of space, much drier than the pit dwellings, but similarly dark inside. Little is known about the interiors, except that for comfort and warmth, residents covered the wooden floors with thin mats of plant fiber, animal skin or cloth.

Throughout the 4th and 5th centuries, Japan interacted increasingly with China and the Korean peninsula, and absorbed much of the culture and technology of the Asian mainland. In part, this absorption was of religious ideas and customs, often relating to burial practices, but it was also an important period for various secular developments, such as improvements in pottery, ironworking, weaving and agriculture. One contribution to the lifestyle of the nobility of the period was the introduction of the continental bed to the Japanese home for the first time. This structure, made of a wood or bamboo framework and covered with straw, mats or cloth, was used solely by the nobility of the period and never became widespread in Japan.

From the 7th century Japan was fascinated by the powerful civilization of Tang China (618–908), and, over the next two centuries or so, embarked on a period of importation and imitation of things Chinese, including the writing system, governmental structure and city planning. Buddhism, with its art and architectural tradition, was also embraced, bringing with it continental artistic and technological innovations that overflowed into the secular realm. Chinese customs and habits were emulated, particularly by members of the Japanese upper classes, who took to wearing Chinese-style dress and employing chairs, folding stools and other sitting devices in their homes. However, as with the continental beds, these chairs were not widely used by the populace as a whole.

The Heian Period (794–1185), which is generally regarded as the classical age of Japanese art and literature, brought about significant developments in architecture and interior design. During this time, the Imperial Court was at its cultural zenith and still enjoyed some degree of political power. The Court lived in the city of Heian-kyo, now known as Kyoto, in a palace compound surrounded by stone walls, isolating the aristocratic inhabitants from the population outside. The palace buildings themselves were made almost exclusively of wood in what is known as the *shinden* style, a style modelled after Chinese palace architecture. This style contained a main chamber and one or more outer buildings, all of which were connected by covered or open corridors. Each building contained a main room surrounded by verandas which were sheltered by the broad eaves of the roof.

These verandas, which were incorporated into secular buildings from earlier Shinto (the native animistic Japanese religion) shrine architecture, had the practical function of enabling residents to watch the outside world from a position protected from the sun and rain. They were also important in a social and psychological sense as they were spaces that were neither inside or outside the house. The veranda could be made part of the interior by the simple action of sliding open the wooden doors separating it from the interior of the house. Conversely, closing the same doors made the veranda a part of the exterior. As they had such a unique, flexible role, these spaces were considered to be areas free from the social status associated with the rooms within the house.

The interiors of these buildings were very dark as little light was able to enter, and, because of their relative openness to the elements, were fairly cool in the summer but bitterly cold during the winter months. As can be seen from the various picture scrolls that depict Heian palace interiors, these residences were largely free of bulky furnishings, as Chinese-style furniture generally failed to appeal to the Japanese. Instead, the floors of these buildings were made of wooden planks, and on them were scattered rectangular straw mats known as *tatami*. These soft, woven mats, measuring approximately 180cm by 90cm and finished with a decorative edging, were a little larger than the circumference of a lying human figure and were employed as bedding or seats as the occasion required.

Some time during this period, sliding doors covered with opaque Chinese paper appeared in these residences. Known as *fusuma* doors, these paper doors served not only as cupboard doors and room dividers, but also as canvases for Chinese-style paintings which provided some of the decoration in the rather sombre apartments. In addition, folding screens made of wood, bamboo, and paper were used as decorative room dividers, or placed on the verandas as protection from the sun. They were also employed by the emperor as screens behind which he sat to address lower-ranking people. Blinds made of reed and bamboo also served as curtains or dividers, and, like the mats, they featured decorative edging and were drawn up with the aid of attractive silk tassels. Other features of the Heian aristocrat's room were low Chinese-style tables, lamps, and curtains which hung on movable T-frames.

Interestingly, much of the decoration of the aristocratic residences of the Heian period was provided by the rich clothing of the courtiers. In particular, women wore several layers of gorgeous silk kimono of various colours and designs, which

revealed their rank, wealth and level of cultural awareness at once. In the cold weather, these garments also served as bed clothes and they were occasionally left draped over screens as a temporary ornament.

In the 12th century, battles raged throughout Japan between various military clans, culminating in the victory of the Minamoto family who transferred the capital to Kamakura on the east coast of Japan and established military rule. Over the next few centuries, during the Kamakura (1185–1336) and the Muromachi periods (1336–1574), Japan was ruled by various military regimes, and the imperial court, though still wielding some cultural influence, lost its political power. Not surprisingly, the nature of the arts and lifestyle of the nation underwent a shift from the elegant, somewhat effete style of the imperial court to the more practical nature of the warrior. In dress, the multi-layered, flowing robes of the courtiers were replaced by lighter, shorter kimonos which allowed more freedom of movement. In architecture, the ruling war lords chose to reside in more practical dwellings, eschewing the complex *shinden* style of residential architecture, in which single units of living space were separated by corridors, in favour of a more concentrated residence, in which one large main chamber was divided up into smaller units of space.

These divisions were made possible by a major innovation – the square wooden pillar, which replaced the circular columns of earlier architecture. These pillars, arranged in rows throughout the main hall, served as posts to which were fitted lintels and sills, enabling the easy installation of sliding screen doors. Such doors, which slide behind each other on a pair of grooves in the sill, were a Japanese invention, and had existed in the Heian period, in the form of the *fusuma* mentioned above. During the Kamakura period, doors were increasingly made with a translucent Japanese paper, known as *washi*, which allowed the gentle diffusion of exterior light into the room and throughout the building. These doors were light and easily detached and were often removed to create a large reception room on special occasions. Exterior doors could also be drawn apart to provide a view of the garden outside, acting as a type of frame around a real natural scene. However, such thin, insubstantial partitions had several disadvantages, as they offered little privacy to the residents and allowed considerable draughts to travel through the residence during cold weather.

The floors of domestic interiors also changed significantly, perhaps because of the more active lifestyles of the warriors and their families. The straw *tatami* mats, previously a single, movable furnishing, were now fitted together to cover completely the wooden floor, a development which strongly influenced the shape, function and decoration of the Japanese room. First, as *tatami* are of a more or less standard size, rooms had to be built to match the dimensions of a certain number of mats, a trend that has continued to the present day. In addition, their soft, fragile surface did not permit the use of heavy furnishings, such as dressers, tables and chairs, which would have dug into and torn the mats. For the same reason, outdoor shoes could not be worn inside the house, leaving the surface of the mats clean enough to sit and lie down on. As a consequence, silk and cotton cushions served as seats, and dining tables were low, most often square or rectangular in shape, with a glossy lacquer finish. In the winters they were fitted with a heating device on their undersides and covered

Japan: drawing of *tokonoma* alcove from *Japanese Homes and their Surroundings* by Edward S. Morse, 1886

with a heavy blanket, under which each person could huddle for warmth. From the early 16th century onwards bedding, in the form of mattresses filled with layers of wadded cotton, was laid out on the mats. These mattresses, or futons, were rolled up and stored in adjacent cupboards when not in use.

Since much of everyday life was conducted on *tatami*, the typical posture of a Japanese indoors is a kneeling position, a fact which explains why many of the furnishings and structural features, such as the ceilings, decorative lintels and beams, as well as door handles and fitted desks, are so low. Most of the decorations of the room, including paintings on sliding doors and portable screens and flower arrangements, were also placed at a low eye level, as they were meant to be appreciated from a kneeling position.

Another significant development in these warrior residences was the addition of three new features to the study chamber, or *shoin*, resulting in a new style of interior design known as the *shoin* style. These new elements were an alcove, a set of staggered shelves, and a window with a fitted desk. All constructed out of wood, as immovable parts of the structure of the room, these elements became key parts of the Japanese interior. The alcove, or *tokonoma*, served as a display space for valuable Chinese-style hanging scrolls of calligraphy and ink paintings and for ceramic and metal vases and other luxury artefacts. Often an elegant flower arrangement was placed in the alcove to suit the season, occasion or character of any expected guest. These floral displays, known as *ikebana*, or "living flower", had their origins in Buddhist temples where they were placed at the altar for worship. Gradually, they began to appear in secular interiors and came to represent a piece of nature living inside the room, reinforcing the idea that there is no real distinction between the inside and outside worlds.

The staggered shelves, often located next to the alcove, were also erected for the display of artefacts. On the shelves, the owner placed a miniature bonsai tree, a carving in some natural material such as wood or even jade, a piece of porcelain or pottery, or a valuable lacquer box or bowl. The desk was often located in front of a window giving onto the garden, providing inspiration for the composition of poetry or Chinese-style ink paintings, both of which were considered highly cultured pursuits during this period. On the desk, there-

fore, a lacquer ink box was almost always present, containing brushes and inkstone, and a container for the water needed to prepare the ink. These lacquer boxes often bore natural motifs, such as flowers, grasses and birds, or scenes from literary classics, and were often decorated using sprinkled gold and mother-of-pearl inlay.

During the Kamakura and Muromachi periods, the custom of tea drinking, borrowed from China, became widespread in Zen Buddhist temples and among the warrior class. As a part of the entertainment of the period, tea gatherings were held at the homes of the wealthy, often in the *shoin* rooms mentioned above, or in Chinese-style pavilions, known as *sukiya*, in the garden. The host often used such gatherings as an opportunity to display his treasures, including Chinese paintings, ceramics, metalwork and lacquer, in the alcoves and on the shelves. In the case of the shogun, connoisseurs of Chinese artefacts were employed both to authenticate and catalogue these treasures and to formulate rules for their display. Two such men were Noami (1397–1471) and Soami (1472–1523) who worked for the shogun Ashikaga Yoshimasa (1436–90), a keen tea drinker and collector of Chinese artefacts. These men were knowledgeable art historians responsible for arranging the shogun's collection of lacquer, porcelain, ink paintings and other treasures to create a sumptuous background to the serving of tea. In this role, they were perhaps Japan's first interior designers.

Late in the Muromachi period, tea gatherings developed into what is generally known as the tea ceremony, or *chanoyu*, a form of tea drinking heavily influenced by Zen Buddhism. The warrior rulers, who had moved their capital back to Kyoto and lived in the Muromachi area, increasingly renounced their political responsibilities to take up refined pastimes such as calligraphy, poetry, Noh theatre and tea drinking. The highly cultured Ashikaga Yoshimasa employed a Zen monk, Murata Juko (1423–1502), as his tea master. In contrast to the refined style of the connoisseurs mentioned above, Juko emphasized the Zen principles of simplicity, humility, and harmony with nature, introducing an aesthetic known as *wabi*, a sort of "symbolic poverty", into the world of tea. Under Juko and the two other major tea men who are said to have formulated the tea ceremony, Takeno Joo (1502–55) and Sen no Rikyu (1522–91), tea drinking was transformed into a spiritual act, and the setting played a key role.

These tea masters encouraged the drinking of tea in rustic tea huts, which were ideal manifestations of the *wabi* aesthetic. Built in imitation of traditional thatched farmhouses, but on a smaller scale, the *wabi* teahouse generally contained four and a half *tatami* mats of floor space. The interior was extremely austere and empty, the only features being a small depression in the floor for the charcoal brazier and an alcove for the display of a scroll and simple flower arrangement. To achieve the desired rustic effect, structural materials were often left in their natural state, the walls of rough clay and straw, the wooden pillar and exposed rafters providing visual and textural variation as well as a sense of natural simplicity. The windows, made of translucent paper, merely permitted a gentle light to enter the room, and their placement at irregular intervals around the walls was deliberately asymmetrical, but nonetheless well balanced. The overall effect was natural and calming, with no ostentation which might distract the mind. Such tea houses or tearooms began to appear in castles,

Japan: Nijo Castle, Kyoto – interior of room with paintings attributed to Kano school, 1603

temples and the homes of the wealthy, serving at once as a place to serve tea to guests and as a spiritual refuge.

Of the great tea masters who designed these tearooms, Sen no Rikyu is regarded as the most influential. He created the most intimate of tearooms, often only two mats in size, enough for the host and one guest, and placed the guest on the mat of honour in front of the alcove while he served the tea from a subordinate position. His manner of decorating the tearoom interior came closest to the *wabi* ideal. Often, he chose to arrange a single flower in a handmade bamboo vase on the pillar at the side of the alcove, or simply shook cherry or plum blossoms onto a dish filled with water to create a simple but powerful display of nature within the tea room.

One of his pupils, Furuta Oribe (1543–1615) was also a celebrated tea master and designer, and his tea rooms were characterized by numerous windows, which he employed, along with the arrangement of the *tatami* mats, to transform the host's seat into a sort of stage. One of his successors, Kobori Enshu (1579–1647), was another notable tea master, who was also famed for his designs of buildings and gardens as well as for his love for antiques. His style is often regarded as a blending of the *shoin* room with the grass tea hut, since many of his tea rooms featured sliding doors and shelves laden with

valuable antiques alongside posts and other wooden features with their bark intact.

The 16th century was a time of civil wars in Japan, and the country was ravaged by the armies of feudal lords battling with each other for supremacy. During the latter half of the century, many of the most powerful lords constructed great castles to protect themselves and to assert their authority. These castles were generally built on high ground and featured stone foundations surmounted by several storeys of wooden structure and tiled roofs. Many castles were burnt to the ground during the feuding, but judging from the interiors of those which have survived, the rooms inside displayed the characteristics of *shoin* style architecture, but often with sumptuous decoration. The interior of Nijo Castle in Kyoto, built by the feudal lord who finally established peace in 1603, Tokugawa Ieyasu (1542–1616), is an early 17th century example of the rich ornamentation enjoyed by the top military men of the land in the late 16th and early 17th centuries. In many of the reception rooms, the walls and *fusuma* doors were almost entirely covered with bold paintings, and the motifs, such as eagles and tigers, symbolizing power and bravery, were meant to intimidate visitors to the lord's castle.

These particular paintings are the work of the Kano school

Japan: print showing interior of pleasure house, by Torii Kiyotada, c.1720–50

of painters who had been active in the Muromachi period but continued to paint as official artists for the military rulers well into the Edo Period (1603–1868). In Japan, it is almost impossible to separate painting from interior design, as Japanese paintings tend to function either as a decorative section of the structure of the room itself or, in the case of movable screens, as part of the furniture. Many warlords employed their own official painters to produce works for their castles, the most elaborate of which involved gold leaf backgrounds and expensive pigments. In addition, the ceilings of the main halls were also gorgeously decorated with geometric painted designs, sections of the wooden walls were finely carved and elaborate metal ornamentation was also fitted to the pillars and beams. A great part of the warlord's wealth went into the decoration of his chambers, and yet the room itself contained little furniture.

The Edo period began when Tokugawa Ieyasu unified the country and moved the capital to present-day Tokyo. During this period, Japan was in a state of relative peace and prosperity, although the warrior class, who were still nominally in charge of the government, found themselves deprived of their martial role and gradually lost their financial and cultural influence. As the nation became increasingly settled and urbanized, the need for castles disappeared, and the wealthy took to building less ostentatious residences. One villa in Kyoto, built

for an imperial prince around 1636, is one of the finest examples of early Edo period architectural design and brings together many of the elements of *shoin* and tearoom architecture. Known as the Katsura Imperial Villa, this elegant residence contains about 40 rooms arranged in an asymmetrical pattern, the main rooms all facing southeast and rooms at the back being used for circulation. Few of the rooms were assigned any specific function, many of them resembling simple tearooms with their unpainted wooden elements and rather empty interiors. In many of these elegant chambers the plain, linear appearance is enhanced only by an ink painting on the wall or sliding door or by decoration such as a repeated leaf pattern on the fusuma doors. Although the overall effect of this interior is one of reserve and simplicity, it must be remembered that, in this aristocratic residence, the materials and craftsmanship were undoubtedly of the finest quality and were by no means cheap.

The artistic developments of the Edo period owe less to the aristocracy or military rulers than to the exuberant culture of the townspeople, who, led by merchants, were enjoying increasing wealth. In Edo, the pleasure quarters and theatres became the focus of artistic energy and feature in much of the art of the time, especially in the colour wood block prints that have come to characterize the period. Some such prints by artists such as Torii Kiyotada (fl. 1720–50) show the interiors

of pleasure houses in the Yoshiwara district of Tokyo, depicted using a strong sense of perspective, borrowed from Western paintings and engravings. These scenes show plentiful space, with the screen doors being drawn open to expand the main room and reveal the other rooms in the building. Furniture is typically sparse, with the occasional small table and lamp, and often the only decoration appears on the screen doors, in the form of abstracted natural motifs and geometric patterns.

The Edo period brought little change in the development of Japanese interiors, although the type of interiors mentioned above became increasingly available to the lower-class townspeople, who were becoming more prosperous. However, due to the increasing crowdedness in cities, many pleasure houses, shops and domestic residences began to feature a second storey, which often served as storage space. The second storey was reached by means of free-standing wooden staircases, which originated in rural areas and appeared in urban shops and houses in the late Edo period. These structures were often disturbingly steep and rather bulky, but they did provide additional storage space. In most cases, they were fitted with cupboards with sliding doors as well as small drawers with metal handles, and were generally used to hold goods and supplies or household articles. Around this time, large wooden storage trunks and cabinets known as *tansu* also began to be used for the storage of clothing and other personal possessions.

Throughout most of the Edo period, Japan had fairly successfully managed to shut out the rest of the world, but when, in the mid-19th century, American and European gunboats appeared off the coast demanding that Japan open up its ports, the island nation was forced to reconsider its isolationist attitude. In 1868, the military government which had ruled Japan for over 250 years collapsed and power was handed over to the Emperor. This new government embarked on an extensive programme of modernization, reorganizing the nation following Western technology, government, communications methods and customs. Western architecture was also absorbed, more as a building technique than for its aesthetic qualities, and many foreign architects were imported to Japan to teach their skills, while Japanese architects were sent abroad to train. However, Western-style buildings were neither practical in Japan's hot, humid climate, nor did their styles suit Japanese taste, and although some of the wealthier, more "modern" Japanese took to wearing Western clothes and using chairs and other Western furnishings in their home, the average Japanese person's lifestyle remained largely unchanged.

In the late 19th century, while Japan was frantically absorbing information from the West, many Europeans became equally fascinated with Japan and its art. In a phase generally known as Japonisme, Europeans, and later Americans, eagerly bought up imported Japanese art objects such as wood block prints and the porcelain, lacquer articles, fans and kimonos which featured increasingly at the international exhibitions of the late 19th century and early 20th century. These prints and decorative objects, with their novel motifs and compositions, inspired many Western painters, most notably James McNeill Whistler (1834–1903), Édouard Manet (1832–83) and Claude Monet (1840–1926) as well as Art Nouveau designers such as Émile Gallé (1846–1904) and Charles Rennie Mackintosh (1868–1928). Japanese artefacts also began to feature prominently in European interiors, often arranged in ways that

would have no doubt surprised the Japanese, and many objects and motifs which were not part of Japanese interior design were given new roles in the Western room. For example, large porcelain jars, decorated in a very un-Japanese flamboyant manner, were often lined up on mantelpieces already crowded with other art objects, while fans, which in Japan were rarely used as decoration in the home, were displayed on walls and shelves as exotic ornaments. Westerners were also greatly charmed by portable folding screens, lacquer boxes and fine metalwork sculptures, all of which inspired many European imitations.

In the 20th century, modernization and Westernization continued to a great extent, and after World War I, the modern architecture movement reached Japan. The Japanese increasingly designed their homes in European styles, both modern and traditional. The interiors generally mixed traditional Japanese and Western-style rooms, the latter often being used for the entertainment of guests, while the old-style rooms were often where the family really lived. It was during this time that many Western architects came into contact with Japanese architecture, often by means of exhibition buildings at world fairs and expositions. Some, such as Frank Lloyd Wright (1867–1959) visited Japan to learn about Japanese architectural design, while many Japanese architects went to study under European architects such as Walter Gropius (1883–1969) and Le Corbusier (1887–1965), thus creating a great exchange of ideas on both interiors and exteriors.

During World War II many of Japan's cities were burnt to the ground, and after the war Japan was forced to rebuild itself, largely under the influence of its former enemy, the United States. This resulted in the Americanization of Japanese architecture, with many architects substituting reinforced concrete, metal and glass for the traditional wood. Elements of interior design began to transform, often for practical reasons. For example, in many homes, sliding doors began to be made with glass instead of paper, so are less easily damaged. Most buildings now have glass windows set in a metal frame, rather than paper and a wooden frame, thus letting in more light in while keeping out the cold. Most Japanese homes, and many hotels and restaurants, have kept the traditional *tatami* mats, however, and living space is still measured according to number of *tatami*. However, many homes have at least one carpeted Western-style room, most commonly a living room or dining room, which is also equipped with Western-style tables and chairs, as well as televisions and other electrical goods. Ironically, in the United States and many European countries, an interest in practical, minimalist interiors has led many people to look to Japan for ideas, resulting in the increasing appearance of futons, portable wooden screens and paper lamps in Western homes.

It was also mainly after World War II that Japanese interior designers became recognized as artists, many of them having found new, exciting methods of expressing traditional Japanese ideas of space and line. Major architects, such as Kenzo Tange (b.1913) and Isozaki Arata (b.1931), who have combined Japanese and Western ideas of architectural design, have attracted much attention throughout the world for their original works. Another important figure, Kazuo Shinohara (b.1925), considered to be one of Japan's most influential house designers, conducted extensive research into the tradi-

Japan: House under High Voltage Lines by Kazuo Shinohara, 1981

tional Japanese house and the Japanese concept of space. His most famous buildings include Umbrella House (1961), which harks back to a late 16th century umbrella-structure tea house by Sen no Rikyu, and his House under High Voltage lines (1981), which features a solid, round central pillar, sliding glass doors opening onto a veranda and abundant interior space, all modern in style and material, but Japanese in conception.

Another of Japan's foremost architects, Tadao Ando (b.1941), also creates highly modern exteriors and interiors with a strong Japanese sense of line and space. One of his most interesting works is the Koshino Residence built in 1981 almost entirely with reinforced concrete and glass on a hillside near Kobe. Despite its modern design and the use of Western-style furniture, the living room retains many traditional Japanese elements, such as matting on the floor, low placement of the chairs and lacquer tables. More significantly, Ando left the concrete interior walls undecorated, a decision reminiscent of tea house interiors with their rough, unpainted clay walls. The room also features a large, rectangular window looking right onto the slope of the hillside, bringing together the interior of the house with the world outside.

Jefferson, Thomas 1743–1826

American statesman and architect

Best known for his political achievements as author of the American Declaration of Independence (1776) and third President of the United States (1801–09), Thomas Jefferson also made lasting contributions to American architecture through his designs for the Virginia State Capitol, Richmond; Monticello, his country estate in Albemarle County; and the University of Virginia, Charlottesville. Inspired to create an American architecture that would win worldwide respect for his young country, he remodelled and furnished dwellings for himself in Paris, New York, and Philadelphia as well as the President's House in Washington, DC. Monticello, his first architectural project, occupied Jefferson's attention for more than forty years. He is reported to have said that "architecture is my delight, and putting up and pulling down, one of my favourite amusements".

Jefferson was the eldest son of the surveyor Peter Jefferson, and was raised in rural central Virginia. Jefferson was a voracious reader with knowledge of seven languages, including Greek and Latin, and his early knowledge of architecture came chiefly from books. About 1768, Jefferson acquired James Gibbs's *Book of Architecture* (1728) while a student at the College of William and Mary in Williamsburg. His later architectural library included five editions of Andrea Palladio's *Quattro Libri*; Jefferson was said to have called this work "the Bible". He also owned Robert Morris's *Select Architecture* (1755). Two of Morris's designs, Plates 2 and 37, may have influenced the first scheme for Monticello.

Erected on land Jefferson inherited from his father, Monticello was begun in 1768. Jefferson chose a site on a low mountain and named it "Monticello", meaning little mountain in old Italian. Monticello's architectural consequence was quickly recognized. The Marquis de Chastellux, who visited in 1782, noted that "Mr Jefferson is the first American who has consulted the Fine Arts to know how he should shelter himself from the weather". Relatively little is known about the furnish-

ings of the earliest period as few survive. Among these are an English-made Queen Anne card table and a tall desk made in Virginia.

Jefferson's knowledge of architecture and art expanded greatly during five years of diplomatic service in Paris. He wrote in 1787 that "from Lyons to Nîmes I have been nourished with the remains of Roman grandeur". The Maison Carrée at Nîmes in fact inspired Jefferson's design for the Virginia State Capitol, whose classical Roman vocabulary Jefferson thought appropriate for the American republic.

Jefferson also admired much of modern Parisian architecture, particularly the Hôtel de Salm with its single storey and dome. He rented the recently completed Hôtel de Langeac (demolished in 1842) designed by Chalgrin at the corner of the Champs-Élysée and the rue de Berri. The oval saloon was decorated with a ceiling painting by Jean-Simon Berthélmey of the rising sun.

The Hôtel de Langeac was entirely outfitted by Jefferson, and its furnishings reveal much about his taste. His choices for four different suites of chairs and various tables suggest that he appreciated elegance and simplicity. Mahogany *fauteuils à la reine* with sabre legs attributed to the famous Georges Jacob are so streamlined they are often mistaken for later Directoire works. The Hôtel de Langeac dining room featured consoles, a dining table that could seat twenty, and patinated and decoratively carved chairs upholstered in blue silk, probably woven in Lyons. The suite may have been made by Jacques Upton who had a shop nearby. Jefferson also acquired three gaming tables, a number of table tops, and an architect's desk with a movable top called a *table à la tronchin*.

Jefferson returned from France in the autumn of 1789. While Secretary of State under President Washington, he lived briefly in New York City in 1790, making modifications to the house he occupied there in Maiden Lane. When the government moved its headquarters to Philadelphia, Jefferson rented an elaborate residence at 234 High Street which he also modified to suit his requirements, adding a book room, stable, garden house, and bed alcove. His French furnishings and sizeable art collection, mainly copies of Old Masters, were installed in tiers throughout the house.

In 1794 Jefferson wanted to leave "the hated occupations of politics" and return to "my family, my farm, and my books". He concentrated his attention toward enlarging Monticello from eight to 21 rooms. The double-storeyed porticos were knocked down but three rooms from the original house were incorporated into the new house. The revised Monticello included features he had seen in France: two narrow staircases rather than a single grand stair (which Jefferson thought too expensive), bed alcoves, a dome, and privies. For comfort and convenience Jefferson also added a dumbwaiter to carry wine from the wine cellar to the dining room, double-acting doors between the entrance hall and parlour, and a dual-faced clock that could be seen in the entrance hall as well as outside on the east portico.

Monticello's new scheme demonstrated a sophisticated understanding of both modern and ancient architecture. The entablatures were much influenced by great Roman buildings that Jefferson had studied in books by Desgodetz, Fréart de Chambray, and Jombert. The entablature of the Temple of Fortuna Virilis became the entablature for his bed chamber, the

Temple of Jupiter for the parlour, and the Temple of Antoninus and Faustina for the entrance hall.

Jefferson designed double-height spaces for the public rooms (the entrance hall, parlour, dining room, and tea room), the third-floor dome room, and his own bed chamber. A “sanctum sanctorum” of bed chamber, cabinet of study, book room, and conservatory helped protect Jefferson’s privacy.

Although Monticello’s Roman Neo-Classical exterior was spare, its interior furnishing was intricate. Judging by inventories and accounts, Monticello was crowded with furniture and works of art hung in tiers in the public rooms. The eclectic furnishings were acquired over a long period of time from a variety of sources in Williamsburg, Paris, London, Philadelphia, and New York. After Jefferson’s financial resources diminished when he retired from the presidency in 1809, a great deal of furniture probably designed by Jefferson was made by several talented slave cabinet-makers. These plain works demonstrate Jefferson’s preference for practical and elegant solutions.

Jefferson’s last architectural work was the design of the University of Virginia which he helped to found in 1819 and called the “hobby of his old age”. A central-domed Rotunda looking west to the mountains housed the university’s library and was flanked by two rows of pavilions for professors, each of a different design and architectural order, connected by student rooms.

SUSAN R. STEIN

Biography

Born in Shadwell, Goochland (now Albemarle) County, Virginia, 13 April 1743, the eldest son of a landowner and surveyor. Studied law at the College of William and Mary, Williamsburg, Virginia, from 1760; became a barrister in 1767. Self-taught in architecture. Active in politics from the late 1760s; drafted the American Declaration of Independence, 1776. Elected Governor of Virginia, 1779; lived in Paris from 1784 and as US Minister to France, 1785–89; first US Secretary of State, 1790–93; US Vice-President, 1797–1801, and President, 1801–09. Helped found the University of Virginia, 1819. Died at Monticello, near Charlottesville, Virginia, 4 July 1826.

Selected Works

The largest collection of Jefferson’s architectural drawings is the Coolidge Collection of Thomas Jefferson Manuscripts, held by the Massachusetts Historical Society, Boston. Jefferson’s papers are dispersed among many repositories. The principal collections are in the University of Virginia, Charlottesville, the Massachusetts Historical Society, and the Huntington Library, Pasadena.

Interiors

- 1768–82 Monticello, near Charlottesville, Virginia (building and interiors): Thomas Jefferson
- 1785–99 Virginia State Capitol, Richmond
- 1796–1809 Monticello, near Charlottesville, Virginia (remodelling of building and interiors): Thomas Jefferson
- 1806–12 Poplar Forest House, Bedford County, Virginia (building and interior fittings)
- 1817–26 University of Virginia, Charlottesville (buildings and interior fittings)

Publications

There are several collections of Jefferson’s writings; the best, though incomplete, is Boyd.

Notes on the State of Virginia, 1785

Jeffrey & Co.

British wallpaper manufacturers, 1836–c.1928

For almost half a century Jeffrey & Co. was one of the foremost producers of wallpaper in England, in terms both of the quality of their products and their influence on designers, decorators, and other manufacturers at home and abroad. To a large extent the firm’s reputation for innovation and quality can be attributed to Metford Warner (1843–1930), who joined as a junior partner in the mid-1860s. It was Warner, for example, who introduced the practice of commissioning work from established and progressive architects and designers such as Walter Crane, E.W. Godwin, Christopher Dresser, Bruce Talbert and C.F.A. Voysey, and who championed the re-evaluation of wallpaper as art. However, the foundations of the

Jeffrey & Co: London showrooms

firm's success were laid long before Warner's arrival, during a period of amalgamation and consolidation.

Jeffrey & Co. were first established in East London as Jeffrey, Wise & Co., c.1836. It underwent several changes of name (Jeffrey & Wise, 1839; Jeffrey, Wise & Horne, 1842; Horne & Allen, 1843; Jeffrey, Allen & Co., 1848) before taking on the title of Jeffrey & Co. in 1858, and although little is known about the firm's early history, it seems by this time to have already been established as an innovative concern, located at Kent and Essex Yard, Whitechapel. As Jeffrey & Wise it is credited with being one of the first London firms to install a cylinder printing machine and, at a time when it was virtually impossible to clean most wallpapers (other than by rubbing them gently with bread) Jeffrey & Wise was listed as being the "sole maker" of a type of washable paperhanging first developed by Crease & Co. earlier in the century.

By 1851 the firm was printing private commissions for the London furnishers and decorators, Jackson & Graham, and it seems likely that, in common with other manufacturers, it was also importing French wallpapers – possibly in association with a Robert Horne, who became a partner c.1842. It is also clear, both from illustrations in *The Journal of Design and Manufactures* (1849–52) and from descriptions of the exhibits it displayed in the Great Exhibition of 1851, that, by mid-century, Jeffrey & Co. was producing a wide range of products to suit almost all sections of the market.

In 1862, trading as Jeffrey & Co., the firm exhibited at the International Exhibition in London and in 1864 it amalgamated with Holmes & Aubert, another established manufacturer, whose Islington premises it enlarged and occupied until

the late 1920s. This merger enabled Jeffrey & Co. to take over production of Holmes & Aubert's high-quality hand-prints, flocks and leaf-metal printed papers and enhanced the firm's reputation substantially.

Soon afterwards Jeffrey & Co. was commissioned by Jackson & Graham to print the series of elaborate papers designed by Owen Jones for the Khedive's (Viceroy's) Palace in Cairo. This was an important and prestigious commission but, in the long term, it was the firm's association on its own account with prominent 19th-century artists, architects and designers which led to its being a major influence.

When Metford Warner joined in 1866 Jeffrey & Co. was already printing the first wallpapers designed by William Morris for his decorating company Morris, Marshall, Faulkner & Co. The following year it printed several designs by Christopher Dresser and the firm's main exhibit at the International Exhibition in Paris was a pilaster decoration designed by Owen Jones. Despite these connections, most of Jeffrey & Co's output was either based on French originals or designs supplied by block-cutters and was largely indistinguishable from the myriad papers produced by other reputable firms; that is, arabesque and chintz designs in the French style, flocks of various kinds, imitations of marbling and wood-grain and other papers for a general middle class market.

However, when Charles Eastlake criticised English wallpaper manufacturers in the first edition of his book *Hints on Household Taste* (1868) Warner (himself an accomplished draughtsman and colourist) decided to try a different approach and commissioned designs from several leading British architects, none of whom had designed for this medium before.

Although some of the first wallpapers produced from their designs received a mixed reception in the trade press, others, for example Eastlake's *Solanum* (1869) and E.W. Godwin's *Bamboo* (1872), proved highly successful. The *Bamboo* pattern, for instance, was especially popular in the United States where samples survive *in situ* in the Major Goodwin parlour, now installed in the Wadsworth Atheneum, Hartford, Connecticut. Moreover, Warner's departure from established practice marked the beginning of a new phase for Jeffrey & Co., raising awareness of the firm's products and associating its name with well-known members of an influential artistic elite. This factor must have had some bearing when, at Warner's insistence, wallpapers were displayed for the first time at the annual Exhibition of Fine Arts in London in 1873. Previously they had only been shown at exhibitions of industrial goods.

This not inconsiderable achievement helped to place Jeffrey & Co. at the centre of a new surge of confidence in the abilities of the home industry, previously perceived as deficient in design flair when compared to its French counterpart, and by the mid-1890s Warner had commissioned patterns from numerous artists and architects, including Walter Crane. Crane's first design, a nursery pattern, was machine-printed by the firm in 1875 and he went on to design more than 60 of its wallpapers.

It is unlikely that many of Crane's papers were themselves financially profitable. Indeed, in 1894, Crane (whose designs were often particularly eccentric) was asked to make his pattern repeats smaller and reduce the number of colours. Nevertheless their reflection of avant-garde ideas and their capacity to win major awards at international and other exhibitions (for which they were often specially commissioned) secured Jeffrey & Co's position as the leading manufacturer of "Artistic" wallcoverings for a discerning market.

As a result, the firm's reputation became closely linked with the hand production of luxury items for consumers who could afford wall decorations with large-scale, highly-coloured patterns, designs printed on or decorated with gold leaf, elaborate flocked papers, embossed and stamped leather wallcoverings and highly-decorated imitation leather papers. However, Warner took care to ensure that, in addition to providing "advanced" patterns and those which satisfied traditional taste, the firm also catered for a less well-off market, producing decorations which, although cheaper, reflected current fashionable styles. Many of these were designed by or had patterns heavily influenced by the work of professional freelancers, including Lewis F. Day, Alan Vigers and A.F. Brophy, and groups such as the Silver Studio.

By 1900 Jeffrey & Co. had won nine gold medals and numerous other awards at international and other exhibitions – several in Paris and the US – was exporting to the USA, Australia and Scandinavia as well as Europe, and its products were reviewed regularly in the trade press and in publications aimed at fashionable consumers throughout the Western world.

Jeffrey & Co. is reputed to have manufactured the first imitation leather paper produced in the UK – embossed with a design by Bruce Talbert – and is also credited with having first marketed co-ordinating wallpapers designed specifically for decorative schemes which divided the wall horizontally into

dado, filling and frieze. In 1871, Christopher Dresser supplied the firm with a series of designs of this kind, together with complementary ceiling patterns, predating the better known tripartite scheme by the architect Brightwen Binyon, issued by Warner in 1875. A similar arrangement, designed by Walter Crane, won a prestigious award for the firm at the Philadelphia Centennial Exhibition (1876) – stimulating demand for a fashion which subsequently became widespread in all sections of the market and remained popular at the cheaper end into the 20th century.

Jeffrey & Co.'s papers were imitated widely from the 1870s and by the turn of the century the firm was competing with manufacturers whose machine-printed papers, often inspired by Jeffrey & Co. originals, were satisfying a mass market which required a high turnover of stylish products at low prices. The firm's success at the Franco-British Exhibition in 1908, where it won the Grand Prix for Walter Crane's *Macaw*, and reviews of its products in the trade press indicate that it was seen to be still in the first rank until the mid-1920s. However, despite the opening of a showroom in central London, Warner, who had been sole proprietor since 1871, found it difficult to maintain the firm's independence in the face of changing fashions and market conditions. Moreover, his sons lacked his business acumen and entrepreneurial flair and, shortly after his retirement in 1924, Jeffrey & Co. was taken over by the Wall Paper Manufacturers Ltd., a joint-stock company that dominated the British industry from 1899. By 1927 manufacture and distribution of the Jeffrey patterns had been transferred to Arthur Sanderson & Sons Ltd., which continues to print many of Jeffrey & Co.'s designs.

Selected Collections

Designers working for Jeffrey & Co. included Walter Crane (1845–1915), Lewis Foreman Day (1845–1910), Christopher Dresser (1834–1904), E.W. Godwin (1833–86), Owen Jones (1809–74), William Morris (1834–96), Bruce Talbert (1838–81) and C.F.A. Voysey (1857–1941). Substantial holdings of Jeffrey & Co. wallpapers can be found in the following collections: Temple Newsam House, Leeds; Public Records Office, and Victoria and Albert Museum, London; Manchester City Art Gallery and Whitworth Art Gallery, Manchester; Cooper-Hewitt Museum, New York; Nordiska Museet, Stockholm.

Jiricna, Eva 1939–

Czech interior designer and architect

Eva Jiricna has gained an international reputation as a designer of innovative and elegant shop interiors for the fashion industry. Often categorised as "High-Tech" – a label that Jiricna herself rejects – her work exemplifies a chic, Modernist aesthetic that exploits the use of industrial materials such as aluminium, matt black cladding and tensioned-steel cables, combined with classic, minimalist forms. The influence of this style has extended far beyond the narrow world of retailing and the sparseness and understatement of her interiors has been widely emulated by contemporary architects and designers in Britain and abroad.

Jiricna's background was firmly rooted in the Modern Movement. Born the daughter of an architect in Zlin, the new town created for the Bata shoe empire in Czechoslovakia, she grew up surrounded by modern furniture in a modern house in a modern city. And she has described her dismay when she moved away from home and observed with horror the kitsch interiors inhabited by other people. She trained as an architect at the Technical University in Prague and, after working in Czechoslovakia for a short period, she was invited to England to join the Greater London Council for a six-month work assignment. While she was in London the Russian tanks entered Prague and Jiricna decided to make London her home, to the great enrichment of the city.

During the 1970s she worked on the design for a large marina at Brighton. Only part of the marina was built, but the project served as a second apprenticeship, providing an opportunity for her to learn the practicalities of architectural work in England, to perfect her English, and to gain an appreciation of quality materials and a love of the detailing of boats and their rigging that was evident in many of her later projects.

In 1979 Jiricna was commissioned to design a shop in London's fashionable South Molton Street for the clothes designer Joseph Ettedgui. The Ettedguis also asked her to design their flat in Sloane Street. By this time her mature style was already formed and these interiors featured hard-edged, machine-made materials used in a frankly industrial way, and combined the precision of a watchmaker with a shiny glamour that had not been seen in Europe since the early interiors of Le Corbusier some fifty years before. They attracted much public-

ity and were an instant success. Jiricna established her own practice and her career was on its way.

In 1982 she re-designed the interior of her own apartment in London's Belsize Park. While the colours in her shops were deliberately kept neutral so as to show off the clothes, the colours in this small apartment were bright and mirrors were used to provide a sense of space. Nevertheless, as in all her work, the design was underpinned by a rational, clear plan.

Meanwhile, the relationship with Joseph Ettedgui proved increasingly productive as he branched out into different activities. The Le Caprice restaurant in Arlington Street represented a new building type and Jiricna's polished and glamorous high-tech interiors were well-received by the restaurant's affluent and high-profile clientele.

Jiricna and Ettedgui's next joint project was the Kenzo shop in London's Sloane Street. This interior retains the monochrome finish and the precision characteristic of the earlier South Molton Street shop and colour is confined to the fitting rooms. But a rich wooden floor with graceful curving steps gives the Sloane Street interior an air of more traditional quality as well as being the first example of Jiricna's winning way with staircases. The next project – Joseph Pour la Maison – was almost next door. This shop marketed an entire lifestyle, selling clothes, furniture and food all under the same roof. The Mallet-Stevens chairs used in the restaurant, for instance, were also on sale in the shop and the divisions between merchandise and fittings were almost indistinguishable. These and other chairs were displayed on "Profilit" shelves, like standard products, but the shelves themselves were made of glass bent to a channel section to give structural rigidity and suggest the imagery of an impossibly chic warehouse. Eileen Gray mirrors, a jewellery showcase as exquisite as the jewellery it displays, and the minimalist background for the clothes, all impart an atmosphere of confident, unforced quality.

The Joseph shop in the Fulham Road, built in 1988, set the scene for the most well-known of Jiricna's interests, the metal staircase with glass treads, hung from stainless steel rods. While most aspects of her shop interiors are reticent so as not to compete with the goods on sale, her staircases are more autonomous, each a hedonistic tour de force. The 1989 Joseph shop at 26 Sloane Street contains a two-storey staircase and takes the concept to its extreme. Engineered by Matthew Wells, it is a stainless steel structure of understated complexity with thin members supporting treads of etched glass. It makes going upstairs an adventure and challenges shoppers to work out the means of support. The elaborate structure has a great number of joints, each one celebrated with beautiful craftsmanship, and gives the impression that – given the right size allen key – it could be disassembled and taken away with the other merchandise.

With success came other clients: the Captain's Restaurant in the Lloyd's Building designed with Richard Rogers, the Way-In department at Harrod's designed with Jan Kaplicky, a series of shops worldwide for Joan and David with Art Deco overtones, and hairdressing salons for Vidal Sassoon. In most of these interiors it is the staircases that are most memorable, and in the commission for Legends night club in Old Burlington Street, Jiricna demonstrated her confidence with this feature by making the suspended staircase curved on plan. Situated beneath a waving ceiling of aluminium rods and placed

Jiricna: interior of Joseph shop, Fulham Road, London, 1988

between drums of perforated stainless steel, it is an extravagant gesture that makes the setting uniquely memorable.

Joel, Betty 1896–1985

British furniture, textile and interior designer

The designer and interior decorator Betty Joel's furniture and interiors were strongly influenced by French styles and reflect the geometrical inspiration of Art Deco mingled with the smoothness and glamour of the Moderne. She established her furniture-making business, Betty Joel Ltd., with her husband David just after the end of World War I in 1919. The company acted as manufacturer as well as retailer and had a factory in Hayling Island, Essex, and a shop at 177 Sloane Street, London. The emphasis was upon quality in both design and manufacture; David Joel had been in the navy and craftsmen yacht-fitters who used traditional joinery and cabinet-making techniques were employed to make the company's early furniture.

Initially the designs represented a stripped-down Arts and Crafts style with neo-Georgian overtones. But by the 1930s Joel had developed a more dashing Modernistic manner. Her work has often been described as an English version of the elegant Moderne style embodied in the work of French furniture designers such as Süe et Mare, and it featured simple, Modernist shapes veneered in luxurious materials like walnut, Macassar ebony, rosewood and ivory. She specialised in using "Empire" woods, the term used to describe woods that came from what are now called the Commonwealth countries and which included Indian laurel, Australian silky oak, and Indian greywood. These unusual materials made even the most traditional designs look fresh and interesting.

Joel's bedroom set, exhibited at the British Art in Industry exhibition at the Royal Academy in 1935, attracted considerable interest and acclaim. And many of her patrons came from the very highest ranks of society and included several members of the royal family – Lord Louis Mountbatten commissioned her to decorate fully and to furnish his London penthouse, and Queen Elizabeth the Queen Mother bought furniture from her while still the Duchess of York – as well as the Savoy Hotel Group for whom she worked on several occasions during the 1930s. But Joel's aim was not simply to provide interior design and furniture for the wealthy; she made a point of also stock-

Joel: living room with chaise longue and rug, early 1930s

ing well-designed but moderately priced furniture to serve a fashionable but more bourgeois clientele.

During the mid 1930s the business expanded. Joel commissioned the architect H.S. Goodhart-Rendel to build a new, larger works on the Kingston by-pass, closer to London than her previous works had been. She also opened a new showroom at 25 Knightsbridge with a façade designed by Goodhart-Rendel. By this time the company not only imported raw materials but also used foreign manufacturers to produce their designs. For, example, a Betty Joel carpet now in the Victoria and Albert Museum was made in China specially for the firm. The design is geometric with bands of cream, circles of red and lines of maroon on a sand-coloured background.

The new showroom sold furniture and textiles designed by other designers as well as those by Joel herself. For instance, in 1937 they featured chairs covered with Aubusson tapestries by the French textile artist Anna Zinkeisen. They also imported prints by artists such as Raoul Dufy and Henri Matisse and a variety of decorative objects that would complement Joel's designs, as well as more utilitarian objects like radios and electric heaters. The shop served as her headquarters and clients could buy furniture and accessories from stock or commission interior design projects on any scale.

A typical example of the Joel interior was illustrated in Derek Patmore's influential book *Colour Schemes for the*

Modern Home (1933). It features natural-coloured, grained, Canadian pine walls and a yellow ceiling. The furniture includes a pink canoe-shaped sofa and ziggurat bookcases with painted red shelves. A similar shape is used in a dressing table of 1931 now in the Victoria and Albert Museum, which is made of Australian oak with ivory handles.

Joel's main achievements were to promote the elegance of the modern French style in Britain and to widen the scope of the interior designer to include industrial design products, particularly those that were labour-saving. She was also well-known for her striking geometric carpets that were finer and denser than others of the time. But despite her success in the early and mid 1930s, her career as a designer came to a somewhat abrupt end when she retired from the business in 1937. The firm itself continued into the 1950s, run by her former husband, David Joel, who revived many of her designs and whose book, *The Adventure of British Furniture*, provides an account of her work.

JANICE WEST

Biography

Born in Hong Kong in 1896, the daughter of Sir James Stewart Lockhart, a senior government official. Educated in England. Married David Joel (divorced 1937). Lived in England and active as a designer of furniture and interiors from c.1919; designed carpets

from early 1930s. Established Betty Joel Ltd. with David Joel, 1919; workshops at Hayling Island, near Portsmouth, retail outlet in Sloane Street, London; opened large new showrooms in Knightsbridge, c.1925; refurbished with façade and new factory in Kingston-on-Thames designed by H.S. Goodhart-Rendel, 1937. Retired, 1937; company continued under the management of David Joel. Exhibited at British Art in Industry Exhibition, Royal Academy, London, 1935. Died near Andover, Hampshire, 21 January 1985.

Selected Works

Betty Joel Ltd. carried out a number of private commissions, including a bedroom for the Countess of Iveagh at Eleveden Hall, and work for Lord Mountbatten (c.1937), the Duchess of York, and Winston Churchill. Her commercial decorating projects included work for the Savoy and St. James's Palace Hotels, shop interiors for Mary Manners, Reillon Frères, and Bramah, and a number of company boardrooms. Many of these interiors and furnishings are illustrated in *The Studio* 1927–37, in Patmore 1938, and Joel 1953. Examples of her furniture are in the Victoria and Albert Museum, London.

Johnson, Philip 1906–

American architect

Starting out as a critic and writer and then becoming an architect in the Modernist and then Postmodernist vein, Philip

Johnson has skilfully followed every twist and turn of style in the design world, finally, in his late eighties, promoting Deconstructionism.

Johnson originally studied classics and philosophy at Harvard, but his great passion was architecture and he was one of the instigators of the 1932 Modern Architecture exhibition at New York's Museum of Modern Art which first introduced the International Style to America. In 1940, he returned to Harvard, this time to the architecture school which was then under the control of Walter Gropius. While still a student Johnson designed and built a house for himself which revealed the direction that he was to follow for the next 15 years. This direction was strongly influenced by that of Mies van der Rohe whom Johnson had invited to America in 1937 to design a house in Wyoming. Mies's Wyoming house was never built, but Johnson's first project owes much to its design, and even more to Mies's court houses of the early 1930s. Johnson surrounded his site with a wooden wall, put a single large window across it to separate interior and exterior space and furnished it with Mies furniture arranged in a very formal manner.

In 1949 Johnson designed a second house for himself, in New Canaan, Connecticut. It is his most famous building and one of the century's most celebrated examples of modern architecture. Since settling in Chicago, Mies had designed an all-glass house at Plano, Illinois and Johnson picked up the idea and built his own version. As he had been a critic before becoming an architect, Johnson was an extremely knowledgeable designer and readily acknowledged his sources, not only Mies, but also Karl Friedrich Schinkel, Claude-Nicolas Ledoux, and the paintings of Ben Nicolson. The New Canaan Glass House was a single space with a polished brick floor, a circular brick core containing bathroom and fireplace, a Nadelman sculpture and Mies's Barcelona furniture. When Johnson found curtainless glass walls oppressive at night, he installed floodlights to illuminate all the surrounding trees, turning the house into a belvedere in the forest.

A single room glass pavilion is no place for weekend guests, so Johnson balanced the glass house with a brick box. Within this brick box he gave the first hints of the way that his architecture would develop, for inside the bedroom is a curvilinear false ceiling apparently supported on false pillars – features that acknowledge a debt to the work of Sir John Soane. Johnson's liking for historical references ran counter to the dominant trends within the Modern Movement which aimed to avoid any overt reference to the past.

The New Canaan House was much admired and brought Johnson a succession of architectural commissions. Most of these were family dwellings and so lack the magic openness of his own house, but even so they are some of the most habitable domestic residences in the United States, combining private rooms where occupants can do what they like with big open living rooms furnished with formally placed Mies furniture.

Johnson collaborated with Mies himself in the design of the Seagram Building on New York's Park Avenue and in 1958 he put the finishing touches to the building with the design of the Four Seasons Restaurant. This interior is Johnson at his best. Lavish, formal, opulent and hedonistic, it uses Mies's *Brno* chairs in a setting of machine age richness. Curtains are great

swathes of anodised aluminium, and the ceiling is marked by a hanging sculpture by Lippold.

In the 1956 design for the Boissonnas House, Johnson faced a new problem, namely clients who would not accept Mies furniture throughout as they already had a fine collection of antiques. Johnson's response was to design a house based on a regular grid of brick piers like Louis Kahn's de Vore house. Johnson sensed that the Miesian approach was on the wane in America and he began exploring new directions.

The New York State Theatre in the Lincoln Center of 1964 has a clear plan and, as always with Johnson, beautiful lighting. Despite a quantity of plush, it has the heaviness of the stripped classicism reminiscent of Italian designers working under Mussolini. This Neo-Classical tendency became more pronounced in the extension that he designed in 1966 to McKim, Mead and White's Boston Public Library. At this stage Johnson appears to have lost some of his early impetus, but his partnership with John Burgee in 1967 started him off in a confident new direction with big corporate clients.

The 1973 IDS Center in Minneapolis introduces the "Crystal Court" or great interior which, as well as being the entrance to an office building, is a shopping mall and a meeting place for the town. The late 1970s saw stylistic experimentation; Thanksgiving Square in Dallas shows a love of pure geometry, with a spiral chapel containing a few folding chairs and an altar consisting of a great cube of Carrara marble standing on a circular plinth of red granite. The Crystal Cathedral in Garden Grove, California returns to the glasshouse idea but on a tremendous scale, seating 4000 and being cooled by fountains. Most famous of the buildings of this period is the 1978 design for the AT&T Headquarters in New York, an overtly classical design with touches of Postmodern irony: "we yearn for some richness" Johnson said, but the design is too heavy for the richness to be properly enjoyed.

As his career progressed Johnson's work became increasingly eclectic, mixing the modern notions that he had so fully embraced at its start with references to the past. When the vogue for Postmodernism passed he used his position at the Museum of Modern Art to promote the designers of Deconstructionism. Skilled and ever sensitive to the mood of the moment, Johnson has always promoted the style of the day, but has equally always moved on before it could grow stale.

JOHN WINTER

Biography

Philip Cortelyou Johnson. Born in Cleveland, Ohio, 8 July 1906. Educated at Harvard University, Cambridge, Massachusetts, 1923–30; studied architecture under Walter Gropius (1883–1969) at Harvard Graduate School of Design, 1940–43. Director, Department of Architecture, Museum of Modern Art, New York, 1930–36 and 1946–54. In architectural practice, Cambridge, 1942–46, and New York, 1954–64; partner: Philip Johnson and Richard Foster, New York, 1964–67; with John Burgee, as Johnson / Burgee Architects, New York, 1967–83, John Burgee Architects with Philip Johnson, New York, 1983–91. Established new practice, Philip Johnson Architects, New York, 1992. Trustee, Museum of Modern Art since 1958. Received numerous prizes and awards since 1950 including Gold Medal, American Institute of Architects, 1978, Gold Medal of Honor, with Mies van der Rohe, Architectural League of New York, 1960, Pritzker Architecture Prize, 1979. Fellow, American Institute of Architects, and American Academy of Arts and Letters. Curated several important modernist exhibitions at the Museum of Modern

Art including Mies van der Rohe, 1936, and Deconstructivist Architecture, 1988; author of many influential books and articles on architecture.

Johnson, Thomas 1714–after 1778

British carver and furniture designer

Thomas Johnson's description of himself in the dedicatory epistle of his "Collection of Designs" (1758) as "an Englishman ... who possesses a truly anti-Gallic spirit ..." and his membership of the anti-Gallican Society, which had been founded "to oppose the insidious arts of the French nation", belies the fact that the source of the style in which he worked, was to a large extent quintessentially French. Mortimer's *Universal Director* of 1763 records Johnson as "carver, teacher of drawing and modelling and author of a book of designs for chimneypieces and other monuments and of several other pieces." His working life was spent at various workshops in or near the Soho district of London, including Queen Street, Seven Dials, Grafton Street and Charlotte Street. His designs show him to have been one of the most creative interpreters of the Rococo in Britain and "with their startling lines and varied imagery, they presented a fresh and ingenious vision" (Hayward, 1964).

One of Johnson's most important contributions was to introduce into the British design repertory elements derived from mainstream, Continental European Rococo. As a creative artist, he was less interested in plagiarising the designs of others than some of his contemporaries, but he did study engraved designs, particularly of French and other Continental ornamentalists, and many of his ideas and motifs were derived from designers such as Jean Berain and Bernard Toro. François Cuvilliers (court architect to the Elector of Bavaria) may also have provided a source for motifs, a suggestion reinforced in plate 13 of Johnson's "Collection of Designs" (1758), which contains designs for candlestands, one of which introduces a pair of dolphins entwined around the central support. Yet despite his adaptation of the most advanced Continental

Thomas Johnson: design for mirror from "Collection of Designs", 1758

Rococo work, Johnson's designs are characterised by a naturalism that would have been unthinkable to French designers. A number of his creative ideas, such as a console table (plate 20 in his "Collection of Designs"), are formed of leafless trees with realistically dripping icicles and a barking hound counterpoised with C-scrolls and vigorous raffle leaves.

The full potential of Johnson's skill as a designer was revealed in his publication *Twelve Girandoles* of 1755. As it became more fashionable to dine later, so girandoles or wall lights became necessary fittings for stylish interiors. Nevertheless, few designs for girandoles had been published until this time and as their form was not severely curtailed by function, a master carver such as Johnson could exploit his originality and skill to the full. Helena Hayward describes these items as "among the potentially more exciting products of the Rococo age", and in this instance the designs revealed Johnson's independence of French examples and the fertile range of his motifs. The designs are taut, jagged and spiky, the outlines pierced by leafless twigs and spurting or dripping water. Scrolls and columns support the structures, but are subsumed in a range of decorative detail. Chinoiserie play little part in the decorative schemes and a rustic mood prevails, with watermills, boats, peasants and a donkey forming prominent elements of the designs. A recurring decorative theme,

which contributes to this vigorous, rustic, and unidealised air, is Johnson's frequent use of scenes derived from Francis Barlow's illustrated publications of *Aesop's Fables* (1666 and 1687), such as, "The Wolf in Sheep's Clothing" or "The Bear and Two Travellers".

Johnson produced a far wider range of motifs for carvers' pieces than his contemporaries, such as Matthias Lock or Thomas Chippendale. In a series of 53 engravings for chimneypieces, looking glasses, picture frames, console tables and other items published between 1756 and 1757, Johnson included among his rustic scenes, some Chinoiserie, trophies, pendant arms and caryatids – motifs, which were later to find their way into the designs of his contemporaries. It may have been as a result of Johnson's influence that in the third edition of *The Director* (1762), Chippendale included more than one hundred designs for carvers' pieces, far more than in previous editions.

Rococo was almost never favoured as an architectural style in Britain, save for garden buildings. Palladian houses, however, were frequently internally decorated and furnished with wild interpretations of the style in plaster or carved and gilded wood. Rococo was also often thought appropriate for the decoration of bedrooms, dressing rooms or rooms with orchestrated views over parkland. In terms of interior furnishing schemes, Johnson and his London contemporaries usually produced designs, which were conceived as isolated items. This approach contrasted with French methods, in which all the elements in an interior, including the ceiling, wall panelling, chimneypiece and console tables were planned as a unified whole. However, as well as creating individual designs for carvers' pieces, Johnson also produced designs for ceilings, walls and chimneypieces, the latter comprising one of the most important features of the 18th-century interior. For example, in Johnson's series of plates published in 1758, which, with modifications and additions, became *One Hundred and Fifty New Designs* in 1761, he includes several ideas for chimneypieces with elaborate overmantel mirrors, a design for a ceiling and a design for the side of a room. Nevertheless, Johnson treats the panels of the room as mere surface ornament, comprising a series of flattened, Rococo *boiseries* hung with trophies of musical instruments, centred on a chimneypiece with overmantel mirror, rather than as architectural elements. This scheme is the only known example of a fully worked out interior by Johnson, as well as being the only English engraving of the period to show a scheme for carved *boiseries*. And it demonstrates that he was happier designing individual pieces than dealing with the complexities of a unified interior, unlike French ornamentalists such as Nicolas Pineau.

The effect of Johnson's designs on furniture making and furnishing schemes was felt beyond Britain, and after his lifetime. *One Hundred and Fifty New Designs* (1761) was one of the most influential English pattern books in Philadelphia, and according to Gregory Landrey, "Numerous examples of eighteenth century (American) carving attest to the popularity of Johnson's designs, especially those based on Barlow's engravings" (Landrey, 1993). Johnson's publication was reprinted in 1834, with his name erased, and under the spurious title *Chippendale's Designs for sconces, Chimney and Looking glass frames, in the Old French style*. The printer, John Weale, clearly intended to capitalise on Chippendale's reputation as

the author of the best known and most impressive pattern book of its day. Nonetheless, Johnson's designs, albeit fraudulently misattributed, were instrumental in the promotion of the "old French" style, as the revived Rococo was called, in interior furnishings in Britain in the second quarter of the 19th century.

No single piece of carved furniture has been directly attributed to Thomas Johnson, although he may have worked exclusively as a specialist carver to a cabinet-maker and upholsterer called George Cole, who supplied a number of houses, including Corsham Court, Wiltshire, Blair Castle and Dunkeld House, with elaborate, carved pieces in the style of Johnson's engravings. It is these engravings of his designs, however, which provide the key to his achievement. As Gervase Jackson-Stops has stated, "they were among the most influential of the period" and were "highly individual in their extravagant asymmetry, often approaching a truly oriental abstraction of design" (*The English Country House: A Grand Tour*, 1984).

ROBIN D. JONES

Biography

Born in London; baptized 13 January 1714. Trained as a carver; active in workshops in Queen Street, Soho, by 1755; subsequently occupied workshops in Seven Dials, Grafton Street, Charlotte Street and Tottenham Court Road; described as a "Carver, Teacher of Drawing and Modelling" and author in 1763. Supplied furnishings to several specialist cabinet-makers and upholsterers, including George Cole. Published several influential books of engraved designs from 1755. Last recorded in 1778.

Selected Works

The largest collection of Johnson's drawings for furniture, ceilings, grates, and silver, is in the Victoria and Albert Museum, London. Examples of furniture attributed to, or after, Johnson's designs, and supplied by the London upholsterer George Cole, are at Corsham Court, Wiltshire, Dunkeld House and Blair Castle. Additional pieces are in the Victoria and Albert Museum, London, and Temple Newsam House, Leeds, and in the Philadelphia Museum of Art. For a more comprehensive list of works see Beard and Gilbert 1986.

Jones, Inigo 1573-1652

English architect and designer

Inigo Jones was the dominant figure in the visual arts of early Stuart England. He contributed as much to interior decoration as to architecture and the court masque, and, in looking at his total achievement, his decorative work provides a link between those two other fields in which he is more often remembered.

A crucial component of the more disciplined classicism which Jones introduced to English design was the subordination of decoration to a proper architectural control. As he wrote in 1615, "In all inuencions of C[a]ppresious ornaments on must first designe ye Ground, or ye thing plaine, as yt is for youse, and on that, varry it, addorne it. Compose yt with decorum according to the youse, and ye order yt is of ...". In designing interiors, Jones was faced with the problem that Palladio, his chief guide on stylistic decorum, had not laid down clear rules. He therefore needed to make his own reconciliation of architectural propriety with current decorative trends, which he did by distinguishing between the levels and types of ornament appropriate for exteriors and interiors. Whereas the outside of a building should be correct and sober, "Sollid, proporsionable according to the rulles, masculine and unaffected", inside the desire for rich effect allowed a more free interpretation of the classical orders. Although Jones was critical of the "Composed ornamentes wch Proceed out of ye abundance of dessignes, and wear brought in by Mihill Angell and his followers", he admitted that they were "of necesety to be youced" for "stucco or ornamentes of chimnie pieces, or the innerparts of hoases". He thought their use was also sanctioned by what he knew of "the Cimeras [rooms] yoused by the ansientes"; certainly, by comparing contemporary work with Roman remains, he was able to justify the decorative idioms developed by Renaissance architects (extracts quoted from Harris and Higgott, 1989).

Inigo Jones: sketch elevation for a chimneypiece for Oatlands Palace, Surrey, 1636, with alternative overmantel designs

The success of Jones's interior schemes was dependent on the ability and sophistication of the decorative artists he employed. He was helped by a period of relative peace on the Continent during most of James I's reign and by the ambitious diplomatic strategy of the king. Diplomats such as Sir Henry Wotton (1568-1639) and Sir Balthazar Gerbier (1592-1663) were a means of contact with Continental craftsmen and artists, particularly Protestants from the Low Countries, who were more able to execute Jones's designs according to his intentions (Thornton, 1978).

From what little evidence remains, it appears that in the first years after his second return from Italy in 1614 Jones's decorative schemes relied on his knowledge of Italian work. Two drawings of 1618-19 of a marble fireplace at Arundel House in London probably designed by Jones show a boldly architectural arrangement, the broken segmental pediment of the overmantel enclosing a cartouche supported by a mask and garlands (Girouard, 1962). We know little else about the interiors carried out for Lord Arundel, although there are tantalising glimpses of the galleries designed to house his collections of

paintings and sculpture in Daniel Mytens's portraits of the earl and countess, painted before 1618 (now at Arundel Castle). In the background of the portrait of the countess can be seen an Italianate shell-backed *sgabello* chair, probably designed by Jones and similar to still-extant examples designed by Franz Cleyn (1582(?)–1657/8) (Thornton and Tomlin, 1980). This is the only evidence we have of any furniture designed by Jones, and raises the fascinating question of the extent of control that he exerted over the contents of the rooms he designed.

The chief problem in assessing Jones's contribution to interior decoration lies in the almost total lack of its survival. We are lucky that the Banqueting House at Whitehall Palace (1619–22), his most ambitious secular interior scheme, survives in something approaching its original condition (there is also the Queen's Chapel at St. James's Palace of 1623–27).

The first aspect of the Banqueting House interior to strike the visitor is the way the discipline of the classical orders coordinates it with the exterior, the two equal storeys and seven regularly-spaced bays of the main façades being echoed inside. However, since the 17th century many of the individual elements of the interior have to some degree been altered – a reflection of the vicissitudes of use to which it has been subjected. A 1773 view of the northern end (reproduced Charlton, 1964:35) shows the wooden gallery flat-fronted before it was altered to support an organ loft in 1829–37, together with what may have been Jones's original door surrounds. Today's unpedimented and slightly anaemic surrounds are also probably 19th-century, as the engraving shows the principal door to have had a broken pediment enclosing the Le Sueur bust of James I now displayed in the building's undercroft. Though less elaborate, it is an arrangement reminiscent of Jones's unexecuted design for the "great doure" preserved at the RIBA. The use of an Ionic columned surround and Jones's favourite motif of a broken pediment enclosing a cartouche makes this drawing the ancestor of the grandiose portals designed by his pupil John Webb for Wilton House and Greenwich Palace (Harris and Higgott, 1989).

Although the Whitehall interior was painted plain white on the structural completion of the building in 1622, its decoration was probably left unfinished for economy. Copious gilding, particularly of the ceiling, was carried out later in 1635–36 – surely part of Jones's original intention, it illustrates the rich interior effect he thought desirable. The ceiling, the most striking decorative feature, was the first English compartmented beamed ceiling to be designed with classically moulded frames and, taking up the Venetian tradition of elaborate wooden *soffitti*, is an instance of the overwhelmingly Italian influences seen in Jones's decorative work at this time (Harris and Higgott, 1989; Held, 1970). Although Rubens's nine canvases glorifying the reign of James I were probably not commissioned until the artist's 1629–30 stay in London, Jones must always have intended the ceiling to frame such painted scenes and almost certainly devised their iconographical programme himself (Strong, 1980). To judge the intended effect of the interior, one should remember that for important ceremonies the lower storey was hung with Mortlake tapestries, probably a lost set woven after the Raphael *Acts of the Apostles* bought by James I (Palme, 1956). The combined splendour must have been overwhelming.

The Queen's House, Greenwich, begun for Anne of

Denmark in 1616 but whose interior fittings were executed for Henrietta Maria between 1633 and 1640, is the other surviving secular building by Jones. Only three ceilings and some wall decorations partially survive from his day. While the Hall and Cabinet have flat compartmented ceilings like the Banqueting House, the Bedchamber has a deep cove, following the guidelines set by Palladio for varying room heights and ceiling types in houses (Palladio I:xxiii–xxiv). The ceiling and the wooden galleries in the Hall retain their original paintwork in white (now faded to grey-green) and gold, giving some indication of what the original treatment of the Banqueting House may have been like. The importance of decorative paint effects in Jones's schemes is hinted at in the accounts for work carried out for Henrietta Maria at Somerset House, where in 1628–29 the New Cabinet Room was given an elaborate treatment in gold, white and blue bice with marbling and grotesque panels, all carried out by Matthew Goodrich (active 1616/17–c.1654) (Colvin, 1982; Croft-Murray, 1962).

Like the Banqueting House, the interiors at Greenwich relied for their effect partly on the contribution of the figurative arts. In 1639–40 Zachary Taylor carved pedestals for statues from the royal collection to go in the Hall; the pieces at Greenwich included the lost Bernini bust of Charles I (Colvin, 1982:121; Chettle, 1937:34). As at Whitehall, it is likely that Jones conceived the programme of *Peace and the Arts* for the Hall ceiling canvases by Orazio Gentileschi (c.1636–38, now at Marlborough House) (Bissell, 1981). Elsewhere in the house, canvases by Gentileschi and other Continental artists, for which frames were being carved by Matthew Goodrich from 1633, formed a major part of the decorative schemes (Colvin, 1982:119). A Giulio Romano *Daedalus and Icarus* was incorporated into the ceiling of the Bedchamber (Chettle, 1937:37–38), while in the Cabinet were canvases commissioned from Jacob Jordaens. A draft of instructions sent by Jones to Jordaens in 1639 about the Cabinet illustrates the close control he maintained: he tells the painter which scenes from the story of Cupid and Psyche are to be depicted and advises him in matters such as iconography, lighting and measurements (Bissell, 1981; Keith, 1936–37).

None of the chimneypieces designed for the Queen's House remain *in situ*, though there is probably one surviving example removed to Charlton House, Greenwich (Newman, 1984). Jones's drawings of fireplaces intended for Greenwich and Henrietta Maria's other palaces in the 1630s show him coming under contemporary French decorative influences, particularly the engraved designs of Jean Barbet and Jean Cotellet, and it is possible that the increasingly Gallic flavour of Jones's Italian-based classical style may have been encouraged by the circles around Charles I's French queen. The variety of these designs form a striking contrast to his earlier work (Harris, 1961; Harris and Higgott, 1989; Thornton, 1978).

Paradoxically, the best impression to be had today of Jonesian interior decoration is in the state apartments of Wilton House, Wiltshire, designed not by Jones himself but by John Webb (1648–52). Their nobility of conception and occasional crudities of execution bear witness both to Jones's synthesising genius and to the cultural constraints under which he worked.

Biography

Baptized in London, 19 July 1573, the son of a clothmaker. Apprenticed to a joiner, St. Paul's Churchyard; described as a "picture maker" in 1603; active as a designer of sets and costumes of court masques and theatricals, often in collaboration with Ben Jonson, c.1598–1640; practised as an architect from c.1608. Visited France, 1609. Appointed Surveyor to Henry, Prince of Wales, 1610. Travelled in Italy with 2nd Earl of Arundel, 1613–14, where Jones acquired drawings by Andrea Palladio and Vincenzo Scamozzi. Appointed Surveyor of the King's Works to James I, 1613; Surveyor-General, 1615. Responsible for many of the principal royal residences and palaces from 1616; designs for interiors date from c.1619. Pupil was the architect John Webb (1611–72). Elected a Member of Parliament, 1621. Died London, 21 June 1652.

Selected Works

The largest collections of Jones's architectural drawings are in the Royal Institute of British Architects, London and at Worcester College, Oxford. Additional important but smaller holdings are in the Devonshire Collection, Chatsworth, Derbyshire and the Ashmolean Museum, Oxford. A chronology of works and projects appears in Harris and Higgott 1989.

Interiors

- 1616 & Queen's House, Greenwich Palace, Greenwich (building
1633–40 and interiors; completed by others): Queen Anne
of Denmark, and Queen Henrietta Maria
- 1618 Arundel House, Strand, London (sculpture gallery and
some interior fittings): 2nd Earl of Arundel
- 1619–22 Banqueting House, Whitehall, London (building and inter-
iors): James I
- 1623–31 St. James's Palace, Westminster, London (additions and
interiors including the Queen's Chapel, the Queen's
Bedchamber and Sculpture Gallery)
- 1628–36 Somerset House, Strand, London (Queen's Cabinet Room,
and Queen's Chapel; Queen's Bedchamber 1630–32; and
Cross Gallery 1635–36)
- 1636–38 Oatlands Palace, Weybridge, Surrey (interiors including
the Queen's Cabinet, Queen's Bedchamber, and Lower
Gallery)
- 1637 Whitehall Palace, London (new Masque Room)

Jones, Owen 1809–1874

British architect and designer

Architect, designer and authority on pattern and historic ornament, Owen Jones is best-known today for his encyclopedic *Grammar of Ornament* (1856), a publication which both reflected and influenced the ideas of British mid 19th century design reformers and which had a significant impact on High Victorian taste. The *Grammar of Ornament* is also well-documented as an important source for Art Nouveau designers, and as a contributory influence on the work of certain Modernists, particularly Frank Lloyd Wright. However, this achievement should not be seen in isolation, but as one result of a much larger project concerning the rational application of ornament in architecture and design.

Jones's interest in architectural decoration and polychromy was stimulated by his travels in the "Orient" – Greece, Istanbul and Egypt – which he made in the early 1830s in the company of the French architect Jules Goury, and later the Egyptologist Joseph Bonomi. Both these men were classicists interested in the use of colour in Greek and Egyptian architecture. In 1834

Jones travelled to Spain, where with Goury he began to make a detailed study of the Alhambra Palace in Seville. Goury died six months into the project but Jones completed the work and returned to England where he published the results of their research as *Plans ... of the Alhambra* (1836–45). The printing of this monumental two-volume work presented considerable technical difficulties and was not a commercial success. But despite this, the book had a widespread influence among architects and designers. First, it established Islamic architecture and design as worthy of serious study, whereas previously it had been regarded as merely exotic or picturesque. Second, the many detailed and strongly coloured illustrations of Islamic ornament provided designers not only with a new decorative idiom, but also with novel solutions to basic problems concerning the decoration of interiors and objects. The design of geometric patterns, the division of interior walls into three zones of dado, fill and frieze, and the use of ceramic tiles as wall decoration are among the innovations which his work suggested. Moreover, many of the principles that Jones observed in the Alhambra – for example, the exclusive use of primary colours in the major features of a decorative scheme – were equally applicable to other styles of ornament.

Jones's clear and structured analysis of Islamic ornament and the spectacular chromolithographic colouring of the plates ensured that the book was well received in the architectural press and Jones became closely associated with Islamic art in the public mind. However, there was no immediate revolution in taste; the Gothic style with its nationalistic and Christian associations continued to serve the aspirations of mid-Victorian society better than the art derived from Muslim culture. Jones himself combined Islamic exterior details with Italianate architecture in his work at nos.8 (1843) and 25 Kensington Palace Gardens (1845) and prepared designs for highly coloured ceiling decorations in the same houses using a mixture of Islamic and Renaissance motifs. He also designed a number of retail interiors in central London (Crystal Palace Bazaar, 1858, and Osler's Showrooms, 1859) using his own interpretations of Islamic ornament in the late 1850s, and during the 1860s he designed a series of rooms at 16 Carlton House Terrace for the millionaire Alfred Morrison. The surviving coffered ceilings from this scheme, installed by Jackson and Graham, are a fine synthesis of Islamic geometric decoration and Victorian craft skill and were highly praised by the *Builder* in 1874. But in general, the "Moorish" style remained an exotic counterpoint to mainstream Western architecture and a contributory influence on the design of textiles, wallpapers and ceramics.

Jones's book on the Alhambra also brought him to the attention of Henry Cole, and through Cole he became involved with the Government Schools of Design and the organisation of the Great Exhibition of 1851. Jones was responsible for the interior decoration of Joseph Paxton's Crystal Palace. He devised a colour scheme of radical simplicity, based both on his experience of Islamic art and also on his interest in the physics of colour, particularly his reading of Chevreul's *The Principles of Harmony and the Contrast of Colours* (in French, 1839; English edition, 1854) and the work of the English colourist George Field. Developing the notion that the primary colours were the basis of all successful ornament, Jones devised a scheme of red, blue and yellow which he believed would

Owen Jones: Greek design from *The Grammar of Ornament*, 1856

maximise the sense of interior space by combining at a distance to produce a soft white light. Using Field's theory of colour harmony, he distributed the colours in a ratio of blue 8: red 5: yellow 3, painting the faces of the girders blue, the soffits and undersides of the beams red, and projecting components yellow. This disposition of colour was augmented by the use of red cloth behind the handrails of the galleries to produce a diffusion of colour described by the *Illustrated London News* as "comparable to the work of Turner".

Jones also took charge of the signage at the exhibition (another red accent in the scheme) and the arrangement and distribution of the exhibits. It is tempting to suppose that the "Bazaar-like" ambience noted by contemporaries may also have derived from Jones's taste for the Orient but there is no direct evidence for this. At the end of the exhibition Jones was commissioned to design several of the architectural Courts which formed part of the permanent display of the re-opened building at Sydenham in South London. His Egyptian, Roman, Greek and Alhambra Courts (1853–54) were a popular success and also provided the raw material for his most celebrated publication, the *Grammar of Ornament*. This impressive

compendium surveyed the history of ornament from pre-history to the Renaissance and included 37 "propositions" or laws governing the appearance and distribution of ornament which were formulated in collaboration with contemporary authorities such as Cole, M.D. Wyatt and J.B. Waring. Endorsed by the backing of the design establishment, the book became a staple part of the teaching in the Government Schools of Design and quickly became an indispensable source book for all those involved in the application of surface patterns.

The success of the Crystal Palace decorations established Jones as the leading British authority on the decoration of iron and glass architecture. Matthew Digby Wyatt sought his advice on the decoration of Paddington Station (1854) and the iron arabesque in the end walls of the train shed, although not actually designed by Jones, certainly demonstrate his influence. Jones himself designed several iron-framed structures in the decade after 1851 – notably St. James's Hall (1855–58) and the Crystal Palace Bazaar (1858). Both buildings featured iron and glass construction, but Jones abandoned the simplicity of the Great Exhibition scheme in favour of more complex polychromatic decorations featuring mirrors, coloured glass, and stencilled motifs derived from plant forms.

In the last years of his life Jones became increasingly involved in activities at South Kensington, both as a teacher and as the designer of interior decorations for the South Kensington Museum (now the Victoria and Albert Museum). He also expanded his practice to include the design of textiles and wallpapers working for firms such as Townsend, Parker & Co., Jeffrey & Co., and Warners. Many of his patterns were inspired by Persian prototypes and by the examples illustrated in A.W.N. Pugin's *Floriated Ornament* (1849). All adhered to the principles outlined in the *Grammar* that "all ornament should be based upon a geometrical construction" and that flowers and other living objects should be replaced by "conventional representations ... sufficiently suggestive to convey the intended image to the mind, without destroying the unity of the object they are employed to decorate". The result was a highly stylised rendering of nature with flat, symmetrical motifs arranged in mechanically plotted rows. The construction of flat patterns from the observation of natural forms, known at the time as "Art-botany", was subsequently criticised for producing somewhat rigid designs but the method rapidly became established as a standard strategy within the South Kensington circle, with Christopher Dresser being its most skilled and best-known exponent.

Owen Jones's work has often been contrasted with that of the Gothic Revivalists on the grounds that the anti-industrialism of Pugin and his followers was at odds with Jones's attempt to operate within the commercial world. But, aesthetically, the generation that began to produce mature work during the 1830s and 1840s had much in common despite differences in ideology. Colour, patterns, and the rational application of newly discovered styles of ornament were the central concerns of a whole generation of British architects and designers. Jones's contribution to this development was to provide a theoretical framework that permitted the new styles to enter the mainstream of design.

Biography

Born in London, 15 February 1809. Apprenticed to the architect, Lewis Vulliamy (1791–1871), 1825–30; studied at the Royal Academy Schools, London, from 1829; travelled with the French architect Jules Gourey in France and Italy, 1830; Egypt, 1832–33; Istanbul, 1833; and Spain, 1833–34. Brother-in-law was the architect James W. Wild. Mainly active as a designer of tiles, wallpapers, and mosaics during the 1840s; began designing linens in the 1850s, and silks in the 1870s; involved in the decoration and design of many private and public interiors from the 1840s. Appointed Superintendent of Works of the London 1851 Exhibition in 1850; from 1852 employed as a lecturer and expert in the Department of Science and Art, London, and appointed Director of Decorations for the Crystal Palace in Sydenham, opened 1854. Lectured and wrote extensively on the principles of design, colour and ornament, publishing the *Plans ... of the Alhambra* (1836–45) and *The Grammar of Ornament* (1856). Awarded gold medals for furniture exhibited at the Paris Exposition Universelle, 1867, and the International Exhibition in Vienna, 1873. Fellow, Royal Institute of British Architects, 1843; Royal Gold Medallist, 1857. Died 19 April 1874.

Selected Works

There is no complete catalogue of Jones's work but the most comprehensive list appears in Lever 1973 which mentions numerous drawings for architectural and interior projects. Designs for tiles, wallpapers and textiles are held in the Prints and Drawings Department of the Victoria and Albert Museum, London; wallpaper pattern books produced for Townsend, Parker & Co., and Jeffrey & Co. are in the Archive of Arthur Sanderson & Sons Ltd., Uxbridge; and a logbook of attributed sketches and schemes for interiors executed for Jackson & Graham is held by the Whitworth Art Gallery, Manchester.

Interiors

- 1843–47 8 Kensington Palace Gardens, London (building and decorations): John Mariott Blashfield
- 1845–47 25 Kensington Palace Gardens, London (building and decorations): John Mariott Blashfield
- 1850–51 Crystal Palace, Hyde Park, London (interior decoration)
- 1852–54 Crystal Palace, Sydenham (decoration with Joseph Paxton including the Greek and Alhambra Courts)
- 1855–58 St. James's Hall, Piccadilly (building and interior decoration)
- 1858 Crystal Palace Bazaar, London (building and interiors)
- 1864 Oriental Court, South Kensington Museum, London (decoration)
- 1865–67 16 Carlton House Terrace, London (interior decoration and furniture): Sir Alfred Morrison
- 1872 Eynsham Hall, Oxford (building, interiors and some furniture)

Jones worked for many commercial manufacturers and his designs included wallpapers for Townsend & Parker, John Trumble & Sons, Leeds, and Jeffrey & Co.; furniture and interior decoration for Jackson & Graham; and textiles for Erskine Beveridge & Co. and Warner & Sons.

Publications

Juvarra, Filippo 1678-1736

Italian architect

In 1703, when he was only 15 or 16, Filippo Juvarra left his native Messina for Rome, to study architecture as an apprentice in Carlo Fontana's studio. In Rome he studied ancient, Renaissance, and Baroque works with equal enthusiasm. His great gifts as draughtsman and designer were soon apparent, and in 1708 he entered the service of Cardinal Ottoboni as a stage designer. In 1714, Victor Amadeus of Savoy offered him a post at his court in Turin as "First Architect to the King," a post he would keep until his death in 1736.

Soon after arriving in Turin, his fame had spread throughout Catholic Europe. He was sought out to do royal commissions in Austria, Portugal, France and Spain. However, the major portion of his work is in Piedmont, in and around its capital. The quantity of work he produced is truly prodigious. In Turin alone, he designed five churches, four royal residences, and four large palazzi, as well as whole quarters of the Baroque city. Of these projects, the ones for which he is most famous are the renovation and façade of the Palazzo Madama (1718-21), La Superga (1717-31), the hunting lodge at Stupinigi (1729-33), and the Chiesa del Carmine (1732-35).

It is very difficult to categorize Juvarra's style; in fact, his encyclopedic knowledge of historical and contemporary works allowed him to tailor his style for each commission to whatever seemed most suitable. In its stylistic variety, his work is a precursor of the eclecticism that is characteristic of the 19th-century approach to design. The client and the particular loca-

tion of the work were of paramount importance in shaping the character of Juvarra's buildings. In royal commissions in town and for commissions of state significance such as the Palazzo Madama and La Superga, Juvarra's work is formal, the façades are richly articulated, and the French influence is particularly clear. When the commissions were for rural settings or for parish churches such as the hunting lodge at Stupinigi and the Chiesa del Carmine, the work is much more playful, spatially experimental, and Italian / Austrian in character.

At the Palazzo Madama, Juvarra is responsible for the front façade and the grand foyer containing the stairs to the state-rooms on the *piano nobile*. It had been the intention of the Madam Reale, the widow of Victor Amadeus I, completely to reconstruct the existing 14th-century castle, but only the central nine bays of Juvarra's 19 bay design were executed. Although it is apparent that the design of the façade was directly influenced by the Palace at Versailles, Juvarra improved upon his model. The proportion of base to wall to cornice is much better; the *piano nobile* dominates the design; and the architectural decoration is much more sculptural and more clearly articulated. Although it borrows freely from France, the effect of the façade is completely Italian; the composition owes much more to Bernini than to Louis Le Vau.

It is the interior of the grand foyer that is of greatest interest, however. It is a single great two-storeyed space, covered with a barrel vault, which runs completely across the front of the building. On either side of the entrance and perpendicular to it, a monumental stair doubles back on itself to return to the central axis and entry to the grand salon on the upper floor. The plan of this double staircase foyer was probably inspired by a Le Vau design for the Louvre; yet, like the façade, its decorative treatment is completely Italian in feeling. The sculptural stair balustrade, the curving forms used at the landings, the stucco decoration which combines lush naturalistic motifs with flat classical elements, and, in particular, the decoration of the barrel vault which superimposes a series of ribs and frames on a coffered surface are clearly inspired by the decoration of Pietro da Cortona.

In contrast to the dignity and grandeur of the Palazzo Madama, the hunting lodge at Stupinigi seems almost frivolous. The Palazzo Madama is Baroque, while the Stupinigi lodge is Rococo. The functional parallel of this royal hunting lodge, located some six miles away from Turin, to Versailles is obvious; yet there is virtually nothing French about this building. Its plan is a combination of Italian and Austrian ideas. Juvarra's mentor, Fontana, had designed a villa with a central pavilion with radiating wings; similarly, the typical Austrian *lustschloss* form as popularized by Fischer von Erlach invariably featured a dominating central pavilion with lower wings to each side. Juvarra borrowed this formal idea and made it his own by extending the wings to create an hexagonal entry courtyard. The base is suppressed so that the staterooms can open directly to the court in front and the garden behind. The exterior architectural decoration is simplified and flattened. All emphasis is placed on the central pavilion which has monumental arched windows and doors in Rococo frames and a complex faceted dome that is particularly Germanic.

In contrast to the restrained simplified exterior decoration, the interior of the grand salon is an illusionistic fantasy and a spatial tour de force. The pavilion is two-storeyed in height

Juvarra: Saloon, Stupinigi, 1729-33

and oval in plan with its long axis perpendicular to the direction of entry. In its center is inserted a square formed by four tall slender piers placed on the diagonal. Between the piers and the curving outer wall a balcony curves in and out in a series of sensuous double curves. The piers rise the full height of the space to support a plaster domical vault over the central space and four apsidal vaults over the gallery spaces. All vaults and all wall surfaces are frescoed with quadratura paintings that echo the doubly curving lines of the balcony edges. The color scheme plays bright pastels against creamy white background surfaces in a way that seems to negate the realism of the painting in favor of an obvious scenographic theatricality. Juvarrà's early work as a stage designer obviously influenced this mature work, and he achieves a paradox: a space that is seemingly weightless and delicate while remaining grandly monumental.

C. MURRAY SMART, JR.

Biography

Born in Messina, Sicily, 1678, the son of a goldsmith. Reputedly studied for the priesthood (ordained 1703) but also studied architecture. Worked in the studio of the architect Carlo Fontana (1638–1714), Rome, 1703–14; taught at the Accademia di San Luca, 1706–08 and 1711–12; worked as a theatre and scene designer, 1714–18. Active as an architect, Turin, and appointed First Architect to Victor Amadeus II of Savoy, 1714–36. Made several more visits to Rome; travelled to Portugal 1719–20; visited Paris and London, where he met Lord Burlington, 1720; employed to design the Royal Palace, Madrid, 1735. Member, Accademia di San Luca, 1707. Died in Madrid, 31 January 1736.

Selected Works

Numerous drawings by Juvarrà for furniture, vases and other ornament are preserved in the Museo Civico and the Biblioteca Nazionale, Turin, which also holds 2 albums of scene designs and many drawings from Juvarrà's Roman period. Additional collections of drawings are in the Kunstbibliothek, Berlin, the Victoria and Albert Museum, London, the Biblioteca Nacional, Madrid, and the Metropolitan Museum of Art, New York. For a complete register of Juvarrà's architectural commissions see Viale 1966.

Interiors

- 1716 Palazzo Birago di Borgaro, Turin (building and interiors)
- 1716 Palazzo Martini di Cigala, Turin (building and interiors)
- 1717–31 Church and Monastery, Superga, Turin (building and interiors)
- 1718 Castello Reale, Rivoli (building and interiors including the salone; not completed)
- 1718–21 Palazzo Madama, Turin (remodelling and interiors including the grand staircase)
- 1720s Scala delle Forbici, Palazzo Reale, Turin (building and interior)
- 1720s Royal Palace, Turin (modelling of theatre)
- 1729–33 Stupinigi Hunting Lodge, near Turin (building and interiors)
- 1732–35 Chiesa del Carmine, Turin (building and interiors)
- 1735 Royal Palace, Madrid (building and interiors; executed in a reduced form)

K

Kauffman, Angelica 1741–1807

Swiss painter and decorative artist

Angelica Kauffman was famed during her lifetime as a portraitist and history painter, but much of her subsequent reputation has rested upon her skill as a decorative artist. Examples of decorative paintings that she actually executed herself, however, are very few and far between. Recent research by Mary Mauchline and Malise Forbes Adams confirms that documented paintings by her hand in English interiors are limited to the four roundels created for Somerset House, London (now in the vestibule of the Royal Academy), and the two overdoors originally created for Derby House, Grosvenor Square (Forbes Adam and Mauchline, 1992). Moreover, their research also undermines the traditional view of Kauffman as an active member of the group of artists and craftsmen working for the architect Robert Adam. It seems that although the designs were certainly her creation, many of the roundels, panels and other decorative paintings in Adam interiors formerly attributed to Kauffman were in fact executed by other members of the Adam circle such as Giovanni Battista Ciprani, Biagio Rebecca and Antonio Zucchi.

Yet the fact that Kauffman was not personally responsible for executing her designs does not make her contribution to interior design in England any less significant. A leading figure within the Neo-Classical movement, Kauffman played an important role within both the fine and decorative arts in nurturing History Painting, the highest genre within European art practice, in a country where only an embryonic tradition of this genre existed. Indeed, it was partly due to the lack of English history painters that the execution of decorative painting – with its dependency on historical and classical themes – relied to so great an extent upon foreign artists. In Kauffman's designs, classical themes were executed with the subtlety and sensibility of the Rococo and were thus the ideal complement to the elegant and refined treatment of classically inspired interiors of the late 18th century. A large number of engravings were made after her work which were widely circulated and which provided cheap, accessible source material for many artists and craftsmen working in a variety of decorative media. Arguably her most popular designs were those which depicted cupids, nymphs, female allegorical figures, heroines and goddesses. According to her 1924 biographers Manners and

Williamson, "it was stated that not one of her works contained anything that could bring the slightest blush to the cheek of a young girl" and it has been suggested that designs by a female artist may have been deemed more appropriate for private apartments such as women's bedrooms. It is not surprising therefore that Kauffman's Cupid designs appear in the Sultana Room and adjoining boudoir at Attingham Park, Shropshire, both rooms designed for the lady of the house.

That Kauffman's designs were well-suited to contemporary tastes within domestic interior decoration is amply borne out by the diversity of ways and instances in which her designs were used. Artists at the Sèvres Porcelain factory drew extensively from portfolios of engravings, and those after Kauffman can be found among engravings after Watteau, Titian and Salvatore Rosa. J-M. Delattre's popular engraving of Kauffman's *Beauty Governed by Reason Rewarded by Merit* of 1782 appears on a saucer which forms part of a prestigious service commissioned by Louis XVI. This particular design also inspired the chimneypiece decoration in the drawing room at Attingham Park and a painted roundel at Newby Hall, Yorkshire. Similarly, an engraving by W. Ryland after Kauffman's design of *Nymphs Adorning a Term of Pan*, published 1 May 1776, is the source for the medallion above the principal door in the dining room at Château de Maisons Lafitte (Paris) carved in bas-relief by N.F.D. Lhuillier; an oval wall painting above the chimneypiece in the boudoir at Attingham Park; a painted overdoor medallion in the Glass Drawing Room created for Northumberland House and now in the Victoria and Albert Museum and the Derby Porcelain figures *Two Bacchantes Adorning a Bust of Pan*. This diversity attests not only to the popularity of her designs but also to their versatility within interior decoration and the decorative arts.

Kauffman designs were clearly much admired by Robert Adam, and decorative paintings after her work appear in several of his major commissions including Kedleston Hall, Osterley Park, Home House and Northumberland House. For example the State Bedroom at Osterley contains a ceiling medallion inspired by Kauffman's *Cupid and the Sleeping Aglaia* and two commodes in the Drawing Room contain images of Diana and Venus with Cupid after Kauffman. Three other painted overdoor medallions (aside from that already mentioned) in the Glass Drawing Room of Northumberland House are also after designs by Kauffman. One depicts Cupid

awakened by Nymphs (*Domino Innocuus*) and is used again as decoration on the overmantel.

Aside from Adam, the cabinet-maker George Brookshaw used designs after Kauffman for the painted decoration of both furniture and chimneypieces. A superb secretaire bookcase of about 1786 by Brookshaw can be seen in the Philadelphia Museum of Art. It is notable in that the five roundels are taken from designs by Kauffman which derive not from the standard classical texts or mythology but from English literature and as such can be related to the increasing interest in England throughout the 18th century in a national cultural identity. This also illustrates the pertinence of Kauffman's designs to contemporary artistic trends. Examples of commodes attributed to Brookshaw and linked to Kauffman can be seen at the Lady Lever Gallery.

Examples of Kauffman's influence can also be found in other countries. Aside from the medallion in Château de Maisons mentioned above, a wall medallion in the dining room of 53 St. Stephen's Green, Dublin, is clearly based upon her design *Cupid Bound by the Graces*, and a chimneypiece decoration in the front drawing room of 11 Rutland Square, Dublin appears to be a hybrid of *Cupid's Pastime* and Kauffman's early history painting *Ariadne Abandoned by Theseus Discovered by Bacchus* (1764). Peter Tomory refers to four ovals commissioned from Kauffman in 1783 by Abate Onorato Caetani for the family villa on the Esquiline Hill in Rome. The subjects were heroines from the works of Ariosto, Tasso and Metastasio. *Constanza* from Isola Disabitata is now in Queensland Art Gallery (Tomory, *Burlington Magazine* October 1987 CXXIX pp.668–69).

JACQUELINE RIDING

Biography

Maria Anna Angelica Catherina Kauffman. Born in Chur (Coire), Switzerland, 30 October 1741, the daughter of a painter Johann Josef Kauffman. Trained under her father; studied in Florence, Rome and Naples, 1759–65. Married 1) "Count de Horn", 1767 (marriage annulled 1768); 2) the painter Antonio Zucchi, 1781 (died 1796). Moved to London, 1766; active as a history painter and portrait painter in England 1766–81; much of her work engraved from the 1770s. Lived and worked in Italy (principally Rome) from 1781; active in Naples 1782–85. Member, Florentine Accademia del Disegno, 1762; member, Accademia di San Luca, Rome, 1765. Founder-member, Royal Academy of Arts, London, 1768. Exhibitor, Free Society of Artists from 1765; Royal Academy, 1769–97. Died in Rome, 5 November 1807.

Selected Works

Examples of furniture incorporating designs after Kauffman are in the Victoria and Albert Museum, London, the Lady Lever Art Gallery, Port Sunlight, Merseyside, and the Philadelphia Museum of Art. Examples of porcelain with designs after Kauffman are in the Bowes Museum, Barnard Castle, County Durham, and the Wallace Collection, London. Notable extant examples of decorative painting and design after works by Kauffman survive in the boudoir and drawing room, Attingham Park, Shropshire; the saloon, Kedleston Hall, Derbyshire; the state bedroom at Osterley Park, Middlesex; and the drawing room, Northumberland House, London (now in the Victoria and Albert Museum).

Kent, William 1685/86–1748

British architect, painter, landscape gardener and designer

William Kent occupies a pre-eminent position in the history of British architecture and interior design. A talented artist, decorator, architect, designer and pioneer of English landscape design, his skills were manifold and as one of the first British architects to concern himself with furniture as well as decoration for his interiors, his career foreshadows that of later architect-designers such as Robert Adam. Moreover, in partnership with his patron, Lord Burlington, he was responsible for the revival of Neo-Classical and particularly neo-Palladian architecture. These styles became standard in many of the more important town and country houses built in England in the first half of the 18th century and Kent himself worked on some of the most prestigious and impressive buildings of the time.

Born in humble circumstances in Bridlington, Yorkshire, Kent studied easel and fresco painting in Italy, where he lived for ten years (1709–19) supported by a number of wealthy patrons. While in Italy he met Richard Boyle, the Earl of Burlington, and this meeting determined the direction of Kent's future career. Accompanying Burlington back to England in 1719 he lodged at Burlington House, the Earl's London home and remained there until his death, almost thirty years later. Secure in Burlington's patronage, Kent rapidly developed his abilities as an interior decorator, architect and landscape gardener.

His first commission was to paint a number of ceilings in

Kent: Saloon, Houghton Hall, Norfolk, 1726–36

Burlington House. Completed in 1720, these paintings were executed in typically Italianate fashion but they also exposed Kent's limitations as a representational artist, especially his tenuous grasp of human anatomy. Nevertheless, despite fierce opposition from the official royal artist, Sir James Thornhill, Kent was awarded the commission to decorate the newly-completed suite of state rooms at Kensington Palace for George I. Here Kent eschewed the Baroque tradition of covering ceilings and walls with scenic painting in favour of the simpler classical idea of a central ceiling motif surrounded by painted decorative devices. The Cupola Room (1722) featured *trompe-l'oeil* representations of coffering on the coved ceiling, painted in blue and gold, with painted marble background and painted shadows. The proportions of the coffering decreased in size as the ceiling ascended to give the illusion of greater height and curvature. The decorative scheme also included wooden wall pilasters painted to resemble fluted stone, painted trophies and a number of gilded statues representing Roman gods. Kent conceived a different solution for the Presence Chamber (1724), employing the "grotesque" style of decoration he had first encountered in Italy. Grotesque-style decoration consisted of the fantastic interweaving of human and animal forms with foliage, scrolls, garlands, and other ornament, painted as a pattern in a flat two-dimensional manner. The effect in the Presence Chamber, enhanced by the bold use of colour, was one of continual movement, the eye being drawn rapidly towards the central motif. Kent was to repeat this theme on the parlour ceiling at Rousham House (c.1738).

The eclectic nature of Kent's work at Kensington Palace is further exemplified by his choice of decoration for the King's Gallery (1727). Here he painted seven scenes from the Ulysses myth along the central rib of the ceiling and surrounded them with grey and white classical motifs on a speckled gold field suggestive of mosaic. On the King's Staircase he reverted to more traditional themes. Mainly executed in grisaille (grey monochrome), the upper part consisted of groups of figures (mainly portraits of courtiers and other dignitaries), presented within painted arches and balustrades, who appeared to be looking down on the stairwell. A similar ceiling painting, including a self-portrait of the artist, completed the scheme.

It was at Burlington's country villa, Chiswick House (1726–32) that Kent's abilities were truly tested for the first time. The overall decorative scheme was rich though sombre and displayed the first evidence of his enthusiasm for classical ornament. The severe architectural line of door frames, pediments and chimneypieces is relieved by the profusion of scrollwork, egg and dart, and Greek key mouldings. His exuberance is also evident in the ceiling treatments, especially in the Blue Velvet Room which contains one of his first compartmented ceilings, with eight pairs of large brackets emphasizing wall and ceiling articulation.

Kent's ideas were to reach fulfilment with the new decorative order that he established at Houghton Hall (1726–36), built by the Scottish architect and fellow neo-Palladian, Colen Campbell for Sir Robert Walpole. Kent used mosaic and grisaille extensively, combined with muted greens, pinks and whites as exemplified in the scrollwork in the White Drawing Room. In the state rooms there is a profusion of ornate gilt mouldings, heavy compartmented ceilings and door frames and chimneypieces reminiscent, like those at Chiswick, of the

work of Inigo Jones. It was for Houghton Hall that Kent also designed his first free-standing furniture. Widely considered to be a unique contribution to the canon of English furniture design, his pieces were designed for show rather than comfort, and exploited to the full the opulence of his interiors. Indeed, he was the first English architect of note to design furniture specifically for his own interiors and his pieces look out of place, both in scale and richness, in any other setting. His chairs, armchairs and settees were usually made of gilt mahogany upholstered in cut velvet. His side, pier and console tables, carved from softwood and gilded, revelled in ornamentation: these included his trademark scallop shells, acanthus, floral swagging and satyr masks.

By the mid 1730s Kent had established himself as the foremost artist and interior decorator of his day. This reputation was consolidated by his venture into architecture, initially with his alterations to Kew Palace (c.1730) and more importantly with his designs for public buildings. He designed the Royal Mews (1733) at Charing Cross, since demolished to make way for the National Gallery, the Treasury Buildings facing the north corner of Horse Guards Parade (1737) and finally the Horse Guards in Whitehall, completed after his death.

The most important of Kent's domestic projects is Holkham Hall in Norfolk, built for Thomas Coke, the Earl of Leicester. The foundations were dug in 1734 but only the family wing was completed in Kent's lifetime. The designs themselves originated with Lord Leicester, whom Kent had first met in Italy, but both Lord Burlington and Kent himself were instrumental in the evolution of the final plans and elevations. Built of a narrow yellow brick with four separate wings the house adhered to the neo-Palladian principles that all three men admired. Kent's designs for the ceilings and chimneypieces in the state rooms were once again indebted to Inigo Jones but he evolved a novel solution for the design of the main hall. This room was placed on the *piano nobile* (first floor) and was surrounded on three sides by colonnades; access to the *piano nobile* itself was via an internal staircase, rather than from the usual external grand staircase.

The other domestic building project for which Kent is best remembered is 44 Berkeley Square, London (1742), built for Lady Isabella Finch. The typically austere exterior conceals one of Kent's most memorable interiors. The staircase – an assemblage of cantilevered and colonnaded balconies surmounted by a barrel-vault ceiling – conveys a sumptuous theatricality and is considered by many to be his finest creation.

Kent was also a skilled landscape gardener, and his reputation rests primarily on the work he executed at Stowe (1730–40) and Rousham (1737–41). Heralding a move away from the traditional Italian Renaissance garden with its formal geometric plan, raised beds and regimented planting that had been popular for much of the 17th century, he pioneered a less formal style of landscape that imitated natural planting, with no obvious planning or artifice. In pursuit of this ideal, he produced gently undulating slopes, introduced tree clumps into lawns, replaced formal canals with sinuous watercourses and asserted the primacy of scene and perspective. He also made frequent use of the Dutch ha-ha, (concealed fence and ditch) which abetted the illusion of nature untrammelled by boundaries. And he added a variety of architectural features – classi-

cal pavilions, temples, follies and obelisks – to enhance the picturesque nature of his natural forms.

In pursuing his own vision of the Palladian aesthetic Kent developed a unique oeuvre which encompassed architecture, interior decoration, furniture design and landscape gardening. In each discipline he offered a break with tradition which provided a powerful stimulus to those who followed in his footsteps.

NICHOLAS NUTTALL

See also Burlington

Biography

Born in Bridlington, Yorkshire, in 1685 or 1686. Travelled to Italy with the architect John Talman (1677–1726), 1709; studied painting under Benedetto Luti and worked as a painter in Rome; toured Northern Italy from 1714. Returned to England, 1719, under the patronage of Lord Burlington (1694–1753) for whom Kent edited Designs of Inigo Jones (1727). Active as a painter and designer of architectural decorations from the 1720s; worked as an architect and landscape gardener from the 1730s. Appointed Master Carpenter, Board of Works, 1726; Surveyor of Paintings in the Royal Palaces, 1728; Master Mason and Deputy Surveyor, 1735; Portrait Painter to the King, 1739. Had two children with Elizabeth Butler. Member, Tuscan Academy in Florence, 1713. Died in London, 12 April 1748.

Selected Works

Important collections of Kent's architectural drawings and decorative designs are held at Chatsworth, Derbyshire, the Drawings Collection of the Royal Institute of British Architects, the Victoria and Albert Museum, the British Museum, Sir John Soane's Museum, London, and the Ashmolean, Oxford. Examples of his furniture can be seen at the Victoria and Albert Museum, Chatsworth, and *in situ* at Houghton Hall, Norfolk.

Interiors

- 1720 Burlington House, London (ceiling decorations): Lord Burlington
- 1722–27 Kensington Palace, London (decorations for the Cupola Room and other State Rooms including the King's Drawing Room, Bedchamber, Gallery and Staircase, and the Presence Chamber and Council Chamber)
- 1726–32 Chiswick House, London (decorations, interiors and furniture): Lord Burlington
- 1726–36 Houghton Hall, Norfolk (decorations, interiors and furniture): Sir Robert Walpole
- 1730–40 Stowe House, Buckinghamshire (decoration of the ceiling of the Entrance Hall and garden buildings)
- 1731 Raynham Hall, Norfolk (decorations and interiors including the Entrance Hall, Belisarius Room, Principal Staircase, Saloon, and Dining Room, and some furniture): 2nd Lord Townshend
- 1734 Devonshire House, London (building, interiors and furniture): Duke of Devonshire
- 1734–48 Holkham Hall, Norfolk (building with Lord Burlington and interiors including the Hall and Library): Thomas Coke, Earl of Leicester
- c.1740 Worcester Lodge, Badminton, Gloucestershire (building and interiors): 3rd Duke of Beaufort
- 1742–44 44 Berkeley Square, London (building and interiors): Lady Isabella Finch

Kimbel and Cabus

American cabinet-makers and interior decorators,
1863–1882

The New York cabinet-making and decorating firm of Kimbel and Cabus was founded during the Civil War and achieved its greatest prominence during the Aesthetic Movement of the

Kimbel and Cabus: advertisement from *American Architect and Building News*, Boston, 24 February 1877

1870s, when the firm became known for its production of furniture in a Modern Gothic style.

Like the principals of most major American firms established during the third quarter of the 19th century, Anthony Kimbel and Joseph Cabus were immigrant craftsmen well-versed in European cabinet-making traditions. Anton, or Anthony, Kimbel (1822–95) received his early training from his father, Wilhelm (1786–1869), a well-known cabinet-maker in Mainz, Germany, and from his maternal uncle and godfather, Anton Bembé (1799–1861), one of a family of Mainz furniture dealers, upholsterers, and decorators. Kimbel later worked with a number of other cabinet-makers, notably Alexandre-Georges Fourdinois in Paris, and with the Parisian designer and publisher Desiré Guilmard before immigrating to New York around 1847.

From about 1848 to 1851 Kimbel was the principal designer in the Broadway shop of Charles Baudouine, and in 1854 he established the firm of Bembé and Kimbel with the financial backing of his German uncle. The partnership inaugurated nearly one hundred years of the Kimbel family's involvement with cabinet-making and interior decoration in America.

From its inception, Bembé and Kimbel garnered excellent credit ratings based upon the high quality of the firm's production, its profitable business, and its "best class of customers." *Gleason's Pictorial Drawing-Room Companion* (Boston, November 1854) published an illustration of a parlor by Bembé

and Kimbel – a rare image of a high-style New York interior from this period – and enthusiastically praised the "magnificent" and "sumptuous" decorations, which were executed in a kinetic, curvilinear Rococo-Revival style. While noting Kimbel's European origins, the author astutely observed that "Mr. Kimbel[s] ... unique styles appear to be American modifications of those now in vogue abroad." In 1857, the firm was commissioned to manufacture armchairs in oak from a design by Thomas U. Walter, architect of the United States Capitol, for use in the House of Representatives. Numerous examples survive in public and private collections (e.g., Maryland Historical Society, Massachusetts Historical Society, Henry Ford Museum, and High Museum of Art), and in the absence of other documented pieces the firm is known today by its association with this robust form.

Kimbel's French-born contemporary and future partner, Joseph Cabus (1824–98) immigrated to the United States between 1832 and 1836 while still a boy. His father, Claude Cabus, was listed as a cabinet-maker in the New York City directories by 1838, and Joseph is so listed for the first time, at his father's address, in 1850. During the 1850s, Cabus worked for Alexander Roux, a prominent cabinet-maker on Broadway. Cabus became Roux's foreman and was his partner for little more than a year, between 1858 and 1860. By 1862, Cabus had his own workshop at 924 Broadway adjacent to Bembé and Kimbel, which had moved to 928 Broadway in 1857.

After Anton Bembé died, in 1861, Kimbel dissolved the

company and within the year established a new partnership with his neighbor Joseph Cabus. According to family history, Kimbel and Cabus began as a small factory supplying other dealers with high-class furniture, but the expansion of its premises on Broadway indicates the steady growth of the business after the Civil War. From 1873 until Kimbel's death in 1895, the principal showroom was located at 7 and 9 East 20th Street in the fashionable neighborhood surrounding Union Square; a factory acquired at 458–460 Tenth Avenue in 1869 remained in Kimbel family hands until 1910.

Relatively little is known of the firm's production during the 1860s, when the influence of the French Second Empire dominated American taste in interior decoration. Fortunately, however, several examples survive of a splendid pedestal cabinet documented to Kimbel and Cabus by a period photograph in one of two rare photograph albums that descended in the Kimbel family to the Cooper-Hewitt National Design Museum Branch Library, Smithsonian Institution Libraries. Monumental in scale, with convex side cabinets flanking a salient pedestal suspended above a deep recess, on which is mounted a large medallion, the best-known example, in rosewood and ebony with marquetry veneers, was given to the Brooklyn Museum as early as 1946 by Susan Dwight Bliss of New York and has since served as a benchmark in the study of 19th-century American furniture.

Ultimately, however, Kimbel and Cabus secured its reputation with its highly original Modern Gothic furnishings during the 1870s. The vocabulary was distinctive, but no doubt drew inspiration from such seminal publications of the design reform movement as Bruce Talbert's *Gothic Forms Applied to Furniture, Metal Work, and Decoration for Domestic Purposes* (Birmingham, 1868), republished in Boston in 1873, and Charles Locke Eastlake's *Hints on Household Taste, in Furniture, Upholstery, and Other Details* (London, 1868), which appeared in the first of eight American editions in 1872. Although some of the firm's work in this idiom probably predates the Philadelphia Centennial Exhibition of 1876, Kimbel and Cabus was one of the few to exhibit Modern Gothic furnishings at the fair and thus deserves credit for bringing the style to the attention of a large and appreciative American audience. The Kimbel and Cabus booth, installed like a drawing room, was commended for being "rich and tasteful enough to rank among the very best of American exhibits in household art" (Ferris, 1877). In its first two volumes *American Architect and Building News* featured two illustrations of Kimbel and Cabus interiors, one of the Centennial display, in July 1876, and one of the East 20th Street showroom, in February 1877.

During the later 1870s, Kimbel and Cabus was prolific in the manufacture of ebonized cherry and, to a lesser extent, walnut and oak furniture in the Modern Gothic style, which was ornamented with linear, incised, and gilded decoration, and often incorporated painted panels on a gold ground or printed paper "tiles," yellow on black, featuring stylized medieval figures or motifs from Christopher Dresser's pattern books. Idiosyncratic stiff-legged or rectilinear forms are typical, frequently embellished with spindles and strapwork hinges, and supported by stylized hoof, bracket, or trestle feet. Of the numerous extant ebonized pieces, many of which are rudimentary in execution, two fall-front desks – one in the

Victoria and Albert Museum and one in the Brooklyn Museum – exemplify this furniture at its best. A hanging key cabinet in the Metropolitan Museum of Art, made in oak and embellished with foliate crockets and elaborate nickel hinges, is an example of the firm's occasionally more literal interpretation of the Gothic Revival. Still other pieces specifically inspired by Elizabethan, Second Empire, Asian, and even Tyrolian models are recorded by the Kimbel and Cabus photograph album, while a refined mahogany *bonheur-du-jour* (private collection, Long Island, New York), with bevelled mirrors on the cupboard doors and brass mouldings, which bears the firm's paper label, suggests Kimbel and Cabus also produced an elegant, if conservative, line of furniture around 1880.

In the absence of business records, a complete chronology of the company's clientele and commissions is still in formation. At least two important interiors survive in New York City: Kimbel and Cabus provided woodwork and furnishings for the Fifth Avenue Presbyterian Church (1875), and was among the elite New York cabinet-makers, including Herter Brothers, Pottier and Stymus, and Associated Artists, to decorate one of the Company Rooms in the Seventh Regiment Armory (1879–80).

Kimbel and Cabus was dissolved in 1882, ostensibly because each partner went into business with his sons. A. Kimbel and Sons was the more successful entity, continuing in business until 1941. While Cabus's firm also continued into the 20th century, it does not appear to have achieved great distinction. A second photograph album documenting furnishings and draperies by A. Kimbel and Sons (Cooper-Hewitt National Design Museum Library) records a tasteful production, including gilded Louis XVth-style furniture and Empire Revival pieces in dark wood plentifully embellished with ormolu mounts, both types popular around the turn of the century. As was also true of other New York firms during the last decades of the 19th century, Kimbel and Sons manufactured furniture and woodwork to designs supplied by architects for important clients, such as Henry Clay Frick for his Pittsburgh home called Clayton (1892).

King, Thomas fl.1829–c.1840

British furniture designer and upholsterer

Thomas King, self-styled "upholsterer of forty five years' experience", was one of the most prolific producers of pattern books in the second quarter of the 19th century. He published fifteen examples between 1829 and 1839 and his work represents the most comprehensive illustration of commercial taste in furniture and upholstery during this period. Little, however, is known about King's life. Despite his claim to long experience in the upholstery trade, he is described in Kelly's London Directory of 1839 as a "Furniture Pattern Drawer (sic)" and the exact nature of his role in the production of the designs in *Original Designs for Cabinet Furniture* (c.1835) and *Supplementary Plates to the Modern Style of Cabinet Work Exemplified ...* (c.1840), which are inscribed as being "published by Mr. T. King", is still unclear. According to the various publications bearing his name, he spent his working life in London's Holborn and Lincoln's Inn Fields, and he is listed variously at, 17 Gate Street, Lincoln's Inn Fields, 11 Little Queen Street, Lincoln's Inn Fields and 214 High Holborn, London. The publication, *Specimens of Furniture in the Elizabethan and Louis Quatorze Styles ...* of c.1840 is inscribed as being by "the Late Mr T. King" and there is no mention of him in Kelly's London Directory of 1843.

During the second quarter of the 19th century "the furnishing of large houses is generally committed to the Upholsterer" (*Architectural Magazine*, 1834), and the period witnessed a marked expansion of the upholsterer's profession and an increasing number of pattern books devoted to the subject of upholstery, as well as furniture design generally. King's books were mainly directed at commercial cabinet-makers who supplied furniture to a predominantly middle-class clientele. This clientele was on the whole content to follow, rather than

to lead contemporary fashions and, as a result, King's designs were fairly conventional. A small number of designs for furniture were in the Gothic or Elizabethan styles, indicating an awareness of the new taste for antiquarianism among more fashion-conscious collectors, but the majority reflected established trends within Modern or Grecian styles and Old French or Louis Quatorze styles.

According to J.C. Loudon, author of an influential treatise on domestic architecture and interiors that appeared in 1833, the Louis Quatorze style (also known as the "Old French" style) was "rather on the increase than otherwise". Many plates in King's publications reflect this trend and illustrate the taste for French styles of the late 17th and 18th centuries, which manifested itself after the Restoration of the Bourbon monarchy in 1814. The "Old French" style encompassed a free reinterpretation of Baroque and Rococo motifs, incorporating features such as scrollwork and interlaced curves, from the reigns of Louis XIV and Louis XV. In his *Designs for Carving and Gilding used in Interior Decoration and Furniture ...* (c.1830), King states that his designs are "arranged with novelty ... and practicality in a variety of styles; including that of Louis XIV (which being at present highly fashionable) is displayed in many examples". The book includes designs for console tables, glasses, chimney glasses and pier tables carved with acanthus scrolls, C-scrolls, masks and cabochons. The taste for Empire-style furniture derived from the work of Percier and Fontaine was also illustrated in a number of King's publications, including *The Modern Style of Cabinet Work Exemplified ...* (1829). The shapes of most of the items are classically based, being in the form of blocks, with ornament restricted to limited sections of classically inspired carving or moulding at the perimeters of the furniture. Various individual designs for Elizabethan or Gothic furniture appear in publications, such as *Original Designs for Chairs and Sofas* (c.1840) and *The Modern Style ...*, where these styles are illustrated as one among many stylistic options on offer in the second quarter of the 19th century. King may also have included these designs in deference to the growing contemporary concern for greater historical accuracy in the treatment of the past styles.

King was extremely conscious of producing publications which, he claimed, would be of practical assistance to the craftsmen who subscribed to his work. In the preface to *The Modern Style ...* he states, "... peculiar attention has been bestowed in an economical arrangement of material and labor, which being a most essential particular, is presumed will render the collection of the greatest utility to the Cabinet Manufacturer". He was also working at a time when developments in technology were directed at producing whichever of the fashionable styles was prevalent and producing it as cheaply and efficiently as possible, and in 1835 he refers to rosettes turned by lathe and then channelled into leaves as "being a considerable saving in the expense of carving". His clear intention was to encourage the rapid and cheap production of furniture, and the fact that Gothic and Elizabethan pieces were more expensive to make due to the hand finishing required, was clearly a factor in discouraging his interest in these styles.

King intended his designs to be used by a wide group of craftsmen and professionals and the *Architectural Magazine* stated that his *Compilation of Splendid Ornamental Designs*

King: bedroom chairs from *The Modern Style of Cabinet Work*, 1829

from *Foreign Works* ... (n.d.) would be "equally useful to the architect, upholsterer, the decorative painter and even the manufacturer of cloths and papers ...". He was also primarily concerned to popularise and disseminate the range of styles and forms deemed appropriate to particular interiors. Thus, *The Modern Style* ... illustrates the diversity of furniture types available for drawing rooms and parlours and includes novelty and "fancy" items such as flower stands, Spanish chairs, easy chairs, loo tables, screens and other articles. He also offers a wealth of advice on the details of interiors, recommending, for example, that "the glass frames of the Parlour and Drawing Room require a marked contrast; the former should be massive, plain and bold in design; while in the latter lightness and elegance should blend with fanciful richness". Such advice was intended to guide a hesitant clientele through the maze of an increasingly bewildering range of styles and forms.

Few of King's designs are known to have been realized as articles of furniture, and a group of Anglo-Indian "fancy" tables, made of ebony in the Old French style, which are based on a plate in *The Modern Style* ..., represents a somewhat untypical exception. His designs were not innovative, nor were they intended to be. But they were clearly popular and their appeal was quite enduring. *The Modern Style* ..., for example, was reissued in 1839 and again in 1862 suggesting that King's designs continued to satisfy the aspirations of a middle-class

clientele, whose desire for furniture with swelling curves, naturalistic carving and thick upholstery, was to culminate in the fashion for rotundity and comfort in the middle decades of the 19th century.

ROBIN D. JONES

Biography

Active as an upholsterer in London from late 1820s. Listed in London directories at 17 Gate Street, Lincoln's Inn Fields, 11 Little Queen Street, Lincoln's Inn Fields, and 214 High Holborn. Published 15 pattern books for furniture, 1829–39. Died c.1840.

Kitchens

Although separate areas for preparing food have been present in larger domestic dwellings since ancient times, in Britain the kitchen seems first to have emerged as a specific room with an identity of its own during the 12th century. During the Middle Ages it led off the Great Hall and in large houses it was approached through a triple-arched opening in the wall facing the lord's table. The two smaller openings led to the pantry and buttery from which bread, beer and candles were served, while the larger archway led via a broad corridor to the kitchen where all the cooking was done on huge open fires. In grand households these rooms could be very large and had high louvred ceilings to assist ventilation and reduce heat and smells. Their architectural treatment was sometimes almost as elaborate as that of the hall, and fine examples survive at Stanton Harcourt, Oxfordshire (1485) and Raby Castle, Durham (mid-14th century).

It was not until the 17th century, however, as the pursuit of comfort increasingly began to inform the organisation of the household and its apartments, that the kitchen really came into its own. The story of this room's subsequent development is closely associated with changing attitudes towards social life, the family and the status of women both within the home and outside it.

Modern notions of domestic comfort appear to have first taken significant shape in northern Europe and most particularly in the Netherlands. The trading wealth brought in by the Hanseatic League coupled with Calvinistic emphasis on simple virtues, and the honesty of hard work, sobriety and family life, combined to provide an atmosphere in which the home and its contents were very highly prized. Family life invariably began to centre on the kitchen, and the furnishing of the room tended to reflect its significance as both a workplace and show-space. Numbers of tables and worktops, often made from barrels, were housed alongside food cupboards. Dressers for the storage and display of pewter and utensils were also important items of furniture along with settles and chairs. As the source of nourishment and warmth – both physical and emotional – and the centre of the woman's realm, the kitchen was also to become the heart of domestic virtue.

During the 18th century, the domestic environment's pragmatic, functional aspect began to be supplemented by a new delight in the aesthetic. During this century, "comfort" came to be associated with a rather more frivolous pleasure in the delights of a finely appointed home. In addition, in practical terms the kitchen was to benefit greatly from technological innovation. By the time that the Brighton Pavilion was remodelled by John Nash for the Prince Regent from 1815, the latest in cooking equipment, from cast-iron utensils to closed ranges, and in lighting and ventilation devices, were incorporated into a room which was intended to be functionally efficient and decorative at the same time.

The kitchen in the Brighton Pavilion was conveniently situated adjacent to the State Dining Room, but in many country houses it was located in a separate wing, a practice that had begun in the late 17th century but which continued well into the Victorian period. Although this arrangement had the advantage of removing cooking smells from the main body of the house, the time involved in carrying food through long

passages and corridors often meant that it was cold before it reached the table. Hot plates and warming devices placed in serving rooms adjoining the dining room were introduced in the early 19th century in an attempt to remedy this failing. In town houses, kitchens and household offices were placed in the basement and were linked to the main rooms via a back staircase. Dumb-waiters were a popular feature in many mid- and late Victorian homes providing a quick and efficient means by which dishes could be passed between the upper and lower floors.

The technological innovation apparent in the development of upper- and middle-class kitchens across Europe and in the United States during the early 19th century was, of course, to increase with the quickening pace of industrialisation. In America, technical advances in the kitchen were paralleled by an increasing interest in the scientific planning of activities centred in it. Catherine Beecher's *A Treatise on Domestic Economy* first appeared in 1841 and, discussing in detail the needs of the kitchen user and their relationship with the main items within it, the book championed a move toward greater efficiency in the organisation and use of the room. One of the more noticeable results of this drive in both the United States and in Britain, where Beecher's work also made an impact, was the inclusion of a larger number of items of built-in furniture. Large, centrally placed tables at which a number of the many tasks of the Victorian kitchen could be performed were also typical. Nevertheless, for much of this period kitchens in wealthier houses were heavily staffed with chefs or head-cooks presiding over numerous under-cooks, kitchen-maids and scullery-maids who carried out the more menial tasks. Robert Kerr, author of *The Gentleman's House* (1864), described such rooms as "having the character of a complicated laboratory" and their complex equipment might include roasting-ranges, stewing-stoves, boiling-stoves, turnspits, hotplates and hot closets (Girouard, 1978).

The 19th-century emphasis on efficiency and functionality, although important, was not the only factor governing the layout of and attitudes towards the kitchen. Equally significant was the continuing emotional role played by the room. In an age in which the home was both haven from the harshness of the outside world and bastion of moral respectability, the kitchen, as the domicile's centre, was of key importance. The notion of the simple, yet welcoming country kitchen-living room, with its blazing hearth, gleaming utensils and signs of honest industry was a central tenet of Arts and Crafts ideology, and if the reality proved to be far from the ideal, it nevertheless remained a potent symbol that has continued to inform middle-class images of domestic life.

During the 20th century, both the psychological and the technological Victorian concerns for the kitchen combined to dominate attitudes towards the room and the way in which it was used. Adjusting to peace in the aftermath of World War I, social thinkers and politicians became aware that a large section of the now decimated population had been unfit for active combat. The waging of "total war" required a healthier population than the ravages of insanitary 19th-century houses had provided for. The desire for hygiene, the advance of manufacturing techniques allowing the possibility of fully fitted furniture and appliances, requirements that women should be

Kitchens: German kitchen, Leipzig, 1880

able to function efficiently and without the help of servants, all contributed to the shaping of the modern kitchen.

During the 20th century, the kitchen has been a repository for all sorts of values and attitudes towards the home and its functions, towards the family and towards women. The history of this room is particularly revealing in terms of what it says about attitudes towards public and private life. In some ways it may be read as a microcosm of the larger house. From the communal cooking space that occupied a part of the medieval great hall to the separate but still public functions of the Dutch 16th-century house, through the 18th and 19th centuries when kitchens were the domain of servants, the early 20th century kitchen emerged as the housewife's room. In the late 20th century the room's functions have become more flexible again, the trend away from very neatly fitted streamlined units being mirrored by its use as a space for family living and for receiving visitors.

Klenze, Leo von 1784–1864

German architect

Leo von Klenze occupies a position in the history of German architecture comparable to that of his compatriot and contemporary, Karl Friedrich Schinkel. Both men were strongly influenced by classicism and both re-shaped royal cities – Munich in the case of Klenze, and Berlin in the case of Schinkel – in the Neo-Classical mode. Both were also architects, painters, and writers, and were fortunate in having royal patrons with sufficient funds to build extensively. And both were students of Friedrich Gilly in Berlin where they became friends.

Following the completion of his studies in Berlin, Klenze spent some time in Italy and in Paris, where he worked in the offices of Percier and Fontaine and was influenced by the teaching of J.N.L. Durand at the Ecole Polytechnique. Through connections made at the French court, Klenze received his first position, that of court architect for Napoleon's brother, Jérôme Bonaparte, who ruled over the newly created Kingdom of Westphalia. Jérôme commissioned Klenze's first building, the Court Theatre at Wilhelmshöhe, but when he was deposed in 1813 this source of patronage came to an end. Klenze was not without a patron for long, however, and in 1814 he met Crown Prince Ludwig, later Ludwig I, in Munich. The two men quickly established a rapport based on their shared appreciation of classical culture, and Klenze was invited to remain in Munich where he quickly supplanted Karl von Fischer as Königlich Oberbaurat, architect to the king.

Like most classicists, Klenze celebrated pure geometry, monumental but simple form, the play of linear elements against planar surfaces, shallow relief, rich materials and colourful decoration in his work. His most notable buildings include various palaces, the Glyptothek (museum of antique sculpture), Pinakothek (art museum), Propyläen, Ruhmeshalle (Hall of Fame), and additions to the Residenz, all in Munich; the Walhalla (Temple of Fame) near Regensburg; the Befreiungshalle (Hall of Liberation) near Kelheim; and a major addition to the Hermitage in St. Petersburg. All are designed in a severe but colourful neo-Greek style.

The public art museum emerged as an important new building type in the early 19th century. Klenze designed three, two in Munich for his Bavarian patron, and one in St. Petersburg for Tsar Nicholas I. The Munich Glyptothek featured Hellenistic and Renaissance elements and had a richly coloured interior. Klenze believed that splendour and colour could make even the most undistinguished antique sculpture look fresh and pure and the sumptuousness of his decorations was therefore intended to present Ludwig's sculpture collection to best advantage. The Pinakothek, designed in 1822 (built 1826–36) to house the royal collection of paintings, was even more sumptuous and included seven top-lit galleries running along the centre of the first floor and a series of small chambers on the north side. Unfortunately both buildings were badly damaged in World War II and the interiors have not yet been

restored. Klenze's addition to the Hermitage, built between 1832 and 1852, was a gray marble building organized around three courtyards and connected to Rastrelli's Winter Palace by bridges at the *piano nobile* level. Each of the three principal façades is different, although all are trabeated and designed in a fairly restrained style. As in Schinkel's Altes Museum in Berlin, the ground floor is reserved for the display of sculpture, and the *piano nobile* was arranged to accommodate the rest of the collections. Floors, steps and column capitals are made of white Carrara marble, the columns are light gray granite, and the walls are yellow Siena marble. The ceilings are coffered and the coffers and the panels in the wall frieze are filled with white reliefs against a blue ground. The layered architectural decoration and elaborate relief of the previous century have been banished, and the spaces are a series of contrasting geometric volumes made up of planar surfaces. The effect is one of serene monumentality and restrained grandeur.

Ludwig I had conceived of building a great monument to pan-German unity, a "Walhalla", in 1807, and he commissioned busts of German heroes to be displayed within it. A competition for the design was held in 1814 but no winners were announced. In 1819 he asked Klenze to supply new designs for the monument; plans were accepted in 1821 and the Walhalla building was constructed between 1830 and 1842. It is a colossal Greek temple, inspired by the Parthenon, and built of unpolished gray marble on a gigantic substructure of stairs and stepped terraces rising 300 feet above the Danube. Inside, the white marble busts are displayed against coloured and veined marble walls. Piers decorated with shallow pilasters of the same rich marble project from the walls to divide the space into three compartments. The lower wall is capped by a marble frieze carved by J. M. von Wagner illustrating the early history of Germany. An attic zone rises above the frieze. Above the piers painted and gilded caryatids, based on the examples sculpted on the Erechtheion but dressed in German bearskins instead of classical drapery, carry an ornamented gilt bronze ceiling. The walls are windowless and the only light admitted to the building enters through a skylight. The geometrical decoration of the floor emphasises the processional character of the space inside and leads to the statue of Ludwig by Andreas Schwanthaler which is the focus of the room. The Walhalla has been likened to a tomb or cenotaph, but an especially splendid one, and it remains one of the finest monuments to Neo-Classicism in the world.

Klenze designed a second great memorial building for a promontory near Kelheim, the Befreiungshalle, which commemorated Bavaria's liberation from the French. Although this building's function, scale and concept are similar to those of the Walhalla, its form is very different. Where the Walhalla follows the Greek temple form, the Befreiungshalle is a vast cylinder of golden stone dressed with figures, with a Doric colonnade executed in white marble. The design of the interior echoes that of the exterior. The wall is divided into three zones, the lowest of which features a ring of piers treated as dark marble Corinthian pilasters carrying a white marble segmental arcade. The piers front a ring of apsidal chapels with coffered half-domes and the pier capitals continue into the chapels as a sculpted frieze which separates the dark, richly-veined, marble wall-covering from the white and gold surfaces of the domes. The middle zone of the central space is polychromed ashlar

Klenze: Walhalla, near Regensburg, 1830–42

marble, lighter but more variable in colour than the marble of the lower dome. The unbroken wall of the middle zone carries a white marble Tuscan colonnade behind which can be seen a striated, coloured marble wall. This colonnade supports a deeply coffered gilded dome whose diagonal pattern is reflected in the pattern of the marble floor. Light is admitted from the oculus in the dome.

A talented and prolific draughtsman, Klenze also designed furniture and lighting for many of his buildings, including the Max-Palais, the Alte Pinakothek, the Königsbau and the Festsaalbau of the Munich Residenz, and the Hermitage Museum. Several of these have a strong Empire flavour and can be compared with the work of both Schinkel and Percier and Fontaine. On the whole, however, Klenze's designs were executed in a rich and massive Neo-Classical style that was strongly in keeping with the character of his buildings.

C. MURRAY SMART, JR.

Biography

Born in Bockenem near Hildesheim, Germany, 29 February 1784, the son of a wealthy lawyer. Studied architecture under Friedrich Gilly (1772–1800) and others, Berlin, 1800–03. Studied and worked in the office of Percier and Fontaine, Paris, 1803. Travelled to Italy, 1818, and 1823–24. Architect to Jérôme Bonaparte, king of Westphalia, Kassel, 1807–13; employed as court architect to Crown Prince Ludwig of Bavaria (later Ludwig I), and Max II, Munich, from 1816 (resigned offices, 1853). Travelled to Greece on behalf of King Ludwig, 1834; employed by Tsar Nicholas I, St. Petersburg, 1839. Designed furniture, lighting and interiors from c.1820. Also active as a prolific writer on architecture, and an archaeologist specializing in ancient Greece. Died in Munich, 27 January 1864.

Selected Works

Interiors

- 1812 Court Theatre, Wilhelmshöhe (building and interiors)
- 1816–31 Glyptothek (museum of antique sculpture), Munich (building and interiors)
- 1822–26 Max Palais, Munich (building, interiors and some furniture)
- 1826–35 Residenz, Königsbau, Munich (building, interiors and some furniture)
- 1826–36 Alte Pinakothek (picture gallery), Munich (building, interiors and some furniture)
- 1830–42 Walhalla (Temple of Fame), near Regensburg (building and interiors; including sculpture and carvings by J.M. von Wagner, Andreas Schwanthaler and others)
- 1832–52 Hermitage Museum, St. Petersburg, Russia (additions, interiors and some furniture)
- 1837–42 Residenz, Festsaalbau, Munich (building, interiors and some furniture)
- 1842–63 Befreiungshalle (Hall of Liberation), Kelheim, Bavaria (building and interiors)

Knobelsdorff, Georg Wenceslaus von

1699–1753

German architect

Georg Wenceslaus (or Wenzeslaus) von Knobelsdorff was King Frederick II of Prussia's most important architect and is widely regarded as having brought the Prussian late Baroque – also known as “Frederick's Rococo” to an end. He blended elements of the Rococo, enriched by motifs from nature, with early classical tendencies and with elements of Palladianism, to form his own distinctive style. While elements of the early classical style often appear in his treatment of façades, his interiors mainly use Rococo or late Baroque forms, such as column or pilaster offsets, ornamental and organic decorations and caryatid motifs. And despite the diversity of his work and his varied approach to the modelling of ornamental decoration, common to all his interior designs are the restraint with which he handles decorative forms, and his paring down of decorative and ornamental devices even in buildings, such as Sanssouci, which include extremely complex systems of decoration.

Determining the extent of Knobelsdorff's involvement in his interiors is complicated by the fact that he employed a number of artists, including Frederick Christian Glume, Johann August Nahl, Johann Michael Hoppenhaupt, Johann Christian Hoppenhaupt, and Antoine Pesne, to execute the stucco, painting and sculptural work. But although the individual achievements of these artists should not be overlooked, the overall conception for the interiors always lay with Knobelsdorff himself. This is clearly demonstrated in Knobelsdorff's architectural drawings, especially in those few that show details of his designs for interiors such as the complete set of plans and drawings for the Berlin State Opera House. The exact nature of the role played by his patron, Frederick, however, is more complex. Frederick had strong views about the design of his palaces which sometimes, particularly in the case of the Vineyard Castle, Sanssouci, resulted in his interfering with Knobelsdorff's plans, and historians continue to debate the respective contributions made by architect and patron to the finished works. Nevertheless, whatever the extent of

Knobelsdorff: marble hall, Schloss Sanssouci, Potsdam, 1745–48

Frederick's interventions, Knobelsdorff's role within the design of the exteriors and interiors of his buildings should not be underestimated.

One of Knobelsdorff's earliest works was his alterations to Rheinsberg Castle, the home of the Crown Prince, in 1737–40. He changed the plans of his predecessor, Kemmeter, which included rooms arranged *enfilade*, to a corridor system designed to unify the Writing Chamber, the Library and the Gallery in the Tower. The decoration includes overdoors with painted floral ornament, ceiling paintings by Pesne which are thematically linked to the function of the rooms, and bright

stuccoed marble and wall mirrors which have the effect of extending the space in the Hall.

In 1740–43, Knobelsdorff built the new wing of the Schloss Charlottenburg which was to serve as King Frederick's official residence. This wing contained a long banqueting hall with 14 rooms on both sides of the stairwell; it was dominated by the Golden Gallery. The ground plan adheres strictly to French prototypes of the kind described by Blondel in his *Cours d'Architecture*. The Golden Gallery features green stuccoed marble and a rich variety of gilded Rococo ornament, executed by Nahl, that changes from one section of wall to another. As

in Knobelsdorff's work at Rheinsberg, representations of the Four Elements and the Four Seasons form part of the iconographic programme.

Whereas the Golden Gallery is totally dominated by Rococo forms, the design of the hallway and stairs (a hall-like vestibule with entrance steps joining from the side) reveals the emergence of early classical tendencies. Ionic double pilasters of yellowish stuccoed marble, with gilded bases and capitals, order the first floor area and form a contrast with the plain walls of the ground floor. The stucco ledge at the uppermost point of the first floor is defined by the figures of Europa, Apollo, Diana, and Night, and the ceiling contains Pesne's painting of *Prometheus Stealing Fire from the Gods*.

The German State Opera House, in Berlin (1740–43), was planned as the principal component in the Forum Fridericanum, a project that was never completed. It was the first free-standing, purpose-built opera house in Europe. Knobelsdorff drew on Palladian textbooks in his proportioning of some of the architectural elements, and the building itself was conceived in the tradition of the Italian box theatre. The auditorium, consisting of a box theatre with four circles, was extremely sumptuous and included much splendid ornament and organic decoration. Because of the lavishness of the overall decorative scheme, the *Loge de la Reine* was not accorded much more importance than any of the other boxes. The stage was flanked with Corinthian columns which were a continuation of those along the outer walls of the theatre, while pilasters bordered the rear. The stage and auditorium could also be combined to form one space when it was used as the Court's banqueting hall. The area in front of the auditorium was taken up on the main floor by the Apollo Hall which featured a gallery, whose balustrade was supported by Hermes pilasters, which was positioned in the upper third of the space. The stage and auditorium built by Knobelsdorff onto the north-east corner of Potsdam Castle's pavilion (1744) have similar structural details.

Knobelsdorff's chief work was the Vineyard Castle, Sanssouci (1745–48). Although he clearly had to pay heed to ideas and plans put forward by Frederick, Knobelsdorff had overall control of the design of the building and its interiors. Indeed, Frederick described the Marble Hall and the vestibule as Knobelsdorff's personal creations, adding that he was said to have drawn upon the Pantheon for the interiors (Kadatz, 1983). Ten pairs of powerful stuccoed marble Corinthian columns dominate the space of the vestibule and can be seen as a continuation of the colonnades on the exterior. Like the vine leaf ornament used on the doors, these columns demonstrate Knobelsdorff's interest in harmonising the interior and exterior features of the building. The design of the Marble Hall features double Corinthian columns, made of Carrara marble with capitals of gilded bronze, standing in front of pilasters. It also includes a dramatic cupola, which is ordered by coffered fields and oval medallions and trophies incorporated into the banding. Four groups of almost free-standing putti on the ledge bordering the cupola carry the emblems of the arts and sciences and illustrate the patron's promotion of these occupations. The marble encrustation of the floor was designed by J.C. Hoppenhaupt; the walls are lined with red-grey and reddish-yellow marble.

Only a small number of Knobelsdorff's interiors have been

preserved in their original state, and many of the buildings that he worked on have been subject to frequent later alterations. Some rooms in the Schloss Rheinsberg, for example, were remodelled by Carl Gotthard Langhans in 1762–69 and again by Boumann in 1786, and Sanssouci has also been repeatedly altered. Similarly, Knobelsdorff's work at Frederick's mother's residence, Monbijou (1740–42), the series of apartments that he designed in Berlin Castle (1741–42), and his interior alterations at Potsdam (1744–46), were all destroyed during World War II. The Berlin State Opera House and the New Wing of Charlottenburg Castle have both been restored, but, even so, the demands of a modern theatre in the one case and insufficient documentary evidence in the other, have meant that some departures from the original appearance of these interiors have been inevitable.

BETTINA JOST

Biography

Born near Crossen, Brandenburg (now Krosno Odrzanskie, Poland), 17 February 1699. Served in the Prussian army, 1714–29; retired due to ill health. Studied painting at the Berlin Academy under the French painter, Antoine Pesne (1683–1757), and architecture with A. von Wangenheim and J.G. Kemmeter. With royal support, visited Rome, 1736–37. Had two daughters by Sophie Charlotte Schöne. Returned to work with Crown Prince Frederick of Prussia on Schloss Rheinsberg. Appointed Surintendant des Bâtiments et Jardins by the new King Frederick, and visited Paris, 1740. Also designed furniture, collaborating with Johann August Nahl (1710–85), the brothers, Johann Christian Hoppenhaupt (1719–1778/86) and Johann Michael Hoppenhaupt (b. 1709). Died in Berlin, 16 September 1753.

Selected Works

A large collection of Knobelsdorff's drawings, including plans and designs for the interior of the Berlin Opera House, is in the Kupferstichkabinett, Berlin.

Interiors

- 1737–40 Schloss Rheinsberg (study, library and Tower Cabinet): Crown Prince Frederick of Prussia (later King)
- 1740–42 Schloss Monbijou (building and interiors): Frederick the Great (for his mother)
- 1740–43 Schloss Charlottenburg, Berlin (new wing: 14 rooms, including "Goldene Galerie", staircase): Frederick the Great
- 1741–42 Berlin Town Castle (suite of apartments): Frederick the Great
- 1741–43 Opera House, Berlin (building and interiors, including the Hall of Apollo)
- 1744–46 Potsdam Town Castle (theatre for "Schlosspavillion" and rearrangement as official residence): Frederick the Great
- 1745–48 Schloss Sanssouci, Potsdam (summer palace; building and interiors): Frederick the Great

Knoll International

American furniture manufacturers and interior designers; established 1938

Knoll International was originally founded in 1939 by the scion of three generations of German furniture makers, Hans Knoll. Upon going into partnership with his wife Florence Schust, the company's name was changed to Knoll Associates, and was changed again to Knoll International with the development of a worldwide organization.

Hans was captivated by the Bauhaus concept, and Florence had studied both at Cranbrook with Eliel Saarinen, and with Mies van der Rohe at Illinois Institute of Technology, so they had similar attitudes toward the use of materials and techniques in the industrial era and toward the integration of furniture and furnishings within an overall concept of design. The husband and wife team both shared and divided their areas of responsibility, with Hans more concerned with the manufacturing and marketing processes and Florence developing the textiles division and the idea of the overall design. Having studied textiles while at Cranbrook and realizing the potential of a readily available source of fabrics in the service of a design concept, Florence incorporated the idea of using both in-house and external designers for each major project. Hans died in an automobile accident in 1955 and Florence continued with the firm, as president until 1959 and as a design consultant until she retired in 1965.

Although Hans Knoll set the direction of the firm, including contracting for the exclusive right to manufacture and distribute pieces such as Mies van der Rohe's already well known *Barcelona* chair, his early death meant that the phenomenal growth of the company as a giant of interior design and of widely-recognized signature furniture is primarily the legacy of Florence Knoll. Trained as an architect and respected for her

sympathy and understanding of architectural issues, she was always able to attract and maintain the support of internationally known designers, who not only produced designs for the company but also acted as clients. Recognizing her strength and abilities in this arena, the firm was restructured at an early stage to allow her to direct her own interior design operation, the Knoll Planning Unit (established in 1943). After her husband's death, Florence Knoll also developed an innovative way of franchising manufacturers to work within Knoll International, and expanded the showroom operations throughout the world.

Among those artists and architects brought into the firm, either as staff designers or on contract, were the artist Harry Bertoia (1915–78), the architect and furniture designer, Eero Saarinen (1910–61), the designer Jens Risom (b.1916), and the fabric designers Arne Jacobsen (1902–71) and Astrid Sampe (b.1909). The firm's reputation was also increased through the purchase of companies such as Gavina, which enabled it to acquire the work of Marcel Breuer and Kazuhide Takahama, and through the acquisition of the rights to distribute such designs as Hans Wegner's *Peacock* chair, as Hans Knoll had earlier done with Mies's *Barcelona* chair. Even the sculptor Isamu Noguchi produced two designs for the firm, a lamp and a stool, having already designed a chair for Herman Miller. Designs such as the Breuer *Wassily* chair and the Mies van der Rohe *Barcelona* chair had been in production before Hans Knoll had started his business, and Eero Saarinen's *Pedestal* chair was more the result of friendship than a business relationship with Florence Knoll. Nevertheless, the integration of these designs into their furniture line, advertising, and image was so complete and seamless, that both the designers and their creations have become synonymous with the firm of Knoll International.

At a time when Herman Miller was the only major competitor for the planning of office spaces, the Knoll Planning Unit developed the notion of conceiving and formulating the design for a business interior with the cooperation of the client. Going beyond the interior designer model of suggesting specific furniture and desired groupings or compatible pieces, the Knoll group's approach was to develop a plan to explore the projected use of space, furniture, and even mechanical equipment systems. The Planning Unit's designers would elicit the client's needs with regard to space and function and enable them to become more aware of real rather than perceived needs. Finally, the Unit would suggest the size and scale of the space; recommend the number and type of furniture units; and such elements of detail as the colors of walls, fabrics, and objects of art. The international importance of this design approach was recognized in the early 1950s when there was a major exhibition of the Knoll designs at the large Paris department store, Le Printemps, and artistic validation was achieved with a 1972 exhibition at the Louvre.

Florence Knoll's last major commission, for CBS (Columbia Broadcasting System), was one of her most important projects and most clearly illustrates the Planning Unit concept. Upon the unexpected death of Eero Saarinen, the CBS building's architect, the president of CBS asked her to design the 35 floors of the building. Florence's task was to create an integrated and sympathetic environment for some 2700 employees who would use the 868 rooms as offices, conference rooms,

Knoll International: CBS offices, New York, by Florence Knoll

secretarial areas, screening rooms, and lounges, within the framework of the exterior design already articulated by Saarinen. She designed all of the rooms, including the office furniture, selecting the texture and color of fabrics, and the graphics, paintings, and sculpture. Recognizing the nature of conferences and executive meetings, she designed much of the furniture – including desks – as flat but elegant work surfaces. Little in the way of drawers or storage spaces was included, as few papers and records were kept directly by the executives. For this and other major design accomplishments, Florence Knoll received many awards from the Museum of Modern Art and the design industry. In 1961 she was awarded the highly prestigious Gold Medal of the American Institute of Architects in recognition “of her broad role in developing interior design and manufacture of furniture, textiles, and interior design accessories in the service of contemporary architecture here and abroad.”

Without Florence Knoll to run it, the Planning Unit was abandoned in 1971, but the concept of overall planning has been resurrected in the Japanese arm of Knoll International,

keeping the Bauhaus approach alive in at least that part of the world.

Working in reciprocity with architects was always a two-way street for Knoll International, and one of their signatures has been the design of their showrooms by highly established contemporary architects. The Boston showroom was designed by the partnership of Charles Gwathmey and Robert Siegel; one in New York by Robert Venturi; the Houston showroom was by Stanley Tigerman; the Houston design was by Sally Walsh. Similarly, in Europe and Asia local architects were given these highly visible commissions, even after Florence Knoll had left the firm. Retiring early to live in Florida with her second husband, Florence Knoll ceased having any direct influence on the company, but the design concepts, approach to integration of furniture and furnishings, and quality control all continue to the present day. The subject of several corporate mergers and purchases, Knoll International is one of the most readily identified design companies, and its many classic designs can be found in offices, homes, and museums. It is a tribute to the success of the furniture designs of the company

that even where regional or national tastes suggest a different approach to design, Knoll designs are in high demand.

JOHN F. PILE

Selected Works

The Knoll Archives at Knoll International, New York, include copies of the company's catalogues, publicity material, photographs and transcripts of interviews with designers. Examples of furnishings produced by Knoll International are featured in most American museums specialising in 20th-century design; notable collections, also including examples of Florence Knoll's work, are in the Metropolitan Museum of Art, and the Museum of Modern Art, New York, and the Cranbrook Academy, Bloomfield Hills, Michigan.

Interiors

- 1949–50 Connecticut General Life Insurance Company, Bloomfield, Connecticut (building by Skidmore, Owings and Merrill; interiors by Knoll Planning Unit)
- 1951 Knoll Showrooms, 757 Madison Avenue, New York (interiors)
- 1957 Rockefeller Institute, New York (atrium and library)
- 1958 H.J. Heinz Co., Pittsburgh (entrance lobby and conference room)
- 1964 Columbia Broadcasting System Headquarters, Madison Avenue, New York (building by Eero Saarinen; interiors by Florence Knoll for Knoll)
- 1970 Knoll Showrooms, 745 Fifth Avenue, New York (interiors by Gae Aulenti for Knoll)
- 1974 Weyerhaeuser Co., Tacoma, Washington (building by Skidmore, Owings and Merrill; office system by Bill Stephens for Knoll)

Knoll International have produced furniture by numerous designers prominent in the Modern Movement including Harry Bertoia, Eero Saarinen, Jens Risom, Franco Albini, Ilmari Tapiovaara, Isamu Noguchi, Marcel Breuer, Carlo Scarpa, Vico Magistretti, Gae Aulenti, Niels Diffrient, Robert Venturi and Joe D'Urso. The company's textiles have included work by Florence Knoll, Astrid Sampe, and Anni Albers.

Korsmo, Arne 1900–1968

Norwegian architect and designer of interiors, furnishings and exhibitions

A leading exponent of the Scandinavian Modern and Scandinavian Design Movements, Arne Korsmo was also an international Modernist inspired by Walter Gropius, Le Corbusier, Charles Eames and Alvar Aalto. Indeed, he was more committed to internationalist ideas than any other Norwegian architect and designer and he introduced important foreign impulses to the Norwegian design milieu. Active both as an architect and designer, he was also closely involved in interior design. Within this context, his work was characterised by two main features: first by his elegant constellations of space, light, colour and texture, combined with exquisite proportioning and attention to detail, and second by his ability to place the different objects in a room in a scenographic unity, thereby creating uniquely artistic interiors.

Korsmo received a classical architectural education at the Norwegian Institute of Technology in Trondheim, where he graduated in 1926. He practised at some of the country's leading architectural firms, Bryn and Ellefsen (1926–27) and later Arneberg and Poulsen (1928). In 1929 he went into business with Sverre Aasland, and in 1935 he established his own office.

By 1928 Functionalism had fully manifested itself in Norway. Korsmo, like many other Norwegian architects, changed his style from modern classicism to Functionalism. His interiors, however, remained reminiscent of Art Deco until about 1930. His own flat from 1929–30 (Lille Frøens vei 14, Oslo, destroyed) shows the use of vivid colours like red, black and silver, and walls decorated with murals in his own design. The ceiling had indirect lighting, and curtains were used as partitions. The tubular furniture was of his own design. He had turned the rooms into three-dimensional compositions instead of furnishing them in the old-fashioned way.

In the mid-1930s he designed a number of cubically formed houses clearly influenced by Le Corbusier and Pierre Chareau, the most characteristic being those in Slemdalsveien 33a-c, Oslo, from about 1936. The interiors are in a simpler style; they have a brighter colour scheme and are more spacious but

with a similar emphasis on refined details and light effects. The furniture was made mostly of wood. The wooden furniture, like the chairs in Villa Benjamin (Slemdalsveien 33a), had a soft and organic design corresponding to the natural character of the material. It bore a certain resemblance to the organic wooden furniture of Alvar Aalto in Finland and Bruno Mathsson in Sweden, but it was more moderate in form and construction. Korsmo's Modernist mural in the same building was destroyed by the German occupants during World War II, who deemed it to be "entartete Kunst" (degenerate art).

In the years around 1930 Korsmo designed a restaurant and several shop interiors. These included the crafts shop *Petit Art* (Drammensveien 4, Oslo, destroyed), designed for his friend Louis Benjamin in 1931, which contained a painting that covered a whole wall. The interior was dominated by geometric forms, white and blue colours, and chrome details. The staircase and rail were clearly influenced by those on ships' decks, and were similar to those in Le Corbusier's interiors of the 1920s. Large windows facilitated practical and elegant displays of the shop's goods. In 1937 Korsmo designed a ladies' fashion shop for the designer Frode Braathen (Fridtjof Nansens plass 5, Oslo, destroyed). The showroom was decked out in blue velvet, with ivory white and chrome details; an ivory white relief by the architect was the only decoration. It formed a sensual, ultramodern and at the same time simple background perfectly suited to the display of exclusive clothes. A tubular steel bar for examining the latest in clothing textiles added to the urban and modern atmosphere of the shop.

During the last years of World War II Korsmo lived in Stockholm where he began to develop an interest in Japanese architecture and design. During this period he became acquainted with the Danish architect Jørn Utzon (later renowned for the Sydney Opera House) and in the years immediately after the war the two collaborated on several competition projects, ranging from town planning to the design of glass and furniture. They also participated in the Museum of Modern Art's International Low-cost Furniture Competition in 1948–49. Unfortunately, however, none of their projects was realized.

After the war Korsmo found it difficult to obtain architectural commissions despite the fact that many building projects were initiated in response to the urgent need for new housing. His modernity, exclusivity and internationalism were not esteemed in the more traditionally oriented post-war period. His wife, the goldsmith and enamel designer Grete Prytz Korsmo (now Grete Prytz Kittelsen) encouraged him to take part in the creation of a new collection of domestic objects for her family's goldsmith firm, J. Tostrup. These objects, which he designed in close collaboration with his wife, had avant-garde forms and used unconventional combinations of materials such as silver and plastic. Stylistically they can be termed Scandinavian Modern and are forerunners of the Scandinavian Design movement in the 1950s. His most renowned work for Tostrup is the silver plate cutlery *Korsmo* for which he received a gold medal at the Milan Triennale in 1954.

The Oslo home that Grete and Arne Korsmo occupied from 1950 (flat in Løkenveien 12, Oslo, interior destroyed) demonstrates Korsmo's artistic inventiveness in the difficult period after the war. The interiors represent one of the first examples of the influence of Japanese design, which was to have a strong

impact on Scandinavian design during the 1950s, and represent a flat, or rather a "room within the room" contained within a conventional post-war house. The original internal walls as well as the windows were hidden by screen walls consisting of frames in Oregon pine covered with white canvas which allowed the light to get through. In front of the windows the screens could be drawn aside when needed. The plan was open with cabinet units used as partitions. The ceiling was "Korsmo blue", a term that emerged as a result of his frequent use of blue in various nuances throughout his career. The decoration consisted of a mixture of the couple's own works and objects collected on their trip to the USA and Mexico in 1949–50, including a mobile by Alexander Calder, wooden articles by James Prestini, furniture by Charles Eames and Indian cult objects. The different artifacts were arranged in a way that made them constitute a unity, a masterful scenography typical of Korsmo.

Korsmo's main work after the war is his and his wife Grete's house in Planetveien 12 in Oslo, built between 1952 and 1955 in collaboration with the architect Christian Norberg-Schulz. The house was based on a modular steel frame. It was planned as both home and workplace and in addition to the two studios – one for Arne and another for Grete – it contained a living room that was intended to be used for various activities like design experiments, slide lectures, and theatre performances. The living room was the largest and most important room of the house and had a large roof unsupported by columns. The room was somewhat reminiscent of a cave; one wall was entirely taken up by windows that provided a magnificent view of the surrounding landscape while the rest of the room was decorated in wood and bright colours. The core of the room was the open fireplace, situated on a slightly lower level. It included a low seating arrangement and its design paralleled that of Japanese tea rooms where people gathered for peace and contemplation under the supervision of a tea master. (This parallel was pointed out by Korsmo himself in an article entitled "Japan og Vestens Arkitektur", 1956.) The furniture consisted partly of square pillows made of foam rubber covered with vividly coloured textiles which were intended to be arranged according to each person's need and convenience. It also included low tables and light, collapsible wickerwork deck chairs which could be carried out to the terrace. The remaining furniture was built-in. The paintings could be moved around the room to take advantage of the changing light conditions and temporary needs. The colour scheme was developed in collaboration with the painter Gunnar S. Gundersen who was also responsible for the large wall painting by the hoistable stair to the first floor. In this building art, architecture and interior design were unified into a harmonious whole.

During the 1930s Korsmo became immensely successful as an exhibition architect; he was one of the architects behind Norway's pavilion at the Paris Universal Exposition in 1937 and the *Vi Kan* exhibition in Oslo in 1938, and after the war he was frequently used as a designer of exhibitions of applied art. He was awarded a Grand Prix for his work on the Norwegian Section at the tenth Milan Triennale in 1954. The design was based on a modular structure made of Oregon pine and a carefully planned colour scheme, which together helped to unify the various parts of the exhibition. Emphasis was put

on suggesting the atmosphere of an ideal modern home, and the few carefully chosen objects were arranged in a domestic fashion. Korsmo controlled the selection of artifacts, which included some of his own designs, and created an artistic unity that was approved by the jury of the Triennale.

Korsmo was also responsible for the design of one of the two Norwegian sections at the next Triennale in 1957. His last great commission as an interior designer was the rebuilding of Britannia Hotel in Trondheim (1961–63) with Terje Moe, which was executed in an extremely simple and elegant style.

Korsmo's *Hjemmets mekano* (Home-erector-set), a wall chart worked out in 1952, presented the theoretical basis for not only his interior designs but also his whole artistic activity. He believed that man's natural activity and creativity should not be hampered but stimulated by his surroundings. The building and interior components should therefore be adjusted according to a module, and a system of standardised components would make it possible for modern dwellers to create a home which fulfilled their needs. As a designer, however, Korsmo often favoured his own aesthetic tastes rather than the wishes of his customers. And although he always designed the furniture for his own architecture, none of his work was ever mass-produced. His designs were clearly too innovative for Norwegian furniture manufacturers.

Finally, Korsmo also exercised a great influence on the post-war generation of interior designers in Norway in his work as a teacher. He taught interior and furniture design at the National College of Art and Design between 1934 and 1956 and took part in numerous educational reforms that were inspired largely by the ideas and practices of the Bauhaus school. Indeed, he was the first person in Norway to teach interior design after modern principles and, drawing together a team of students from the school's various departments, he encouraged his pupils to devise complete interiors including furniture, textiles, and tablewares. In 1945 a group of his former students created the Norwegian Federation of Interior and Furniture Designers. In 1956 he was appointed professor of architecture at the Norwegian Institute of Technology in Trondheim where he established a space-laboratory, experimenting with the intercommunication of form, space and colour in collaboration with his students.

Although a main exponent of the Scandinavian Modern and Scandinavian Design Movement Korsmo was the internationalist *par excellence* among Norwegian architects and designers. In this way he brought important foreign impulses to the Norwegian design milieu.

Biography

Born in Oslo, 14 August 1900. Studied architecture at the Norwegian Institute of Technology, Trondheim, Dip.Arch., 1926; toured Europe on a Henrichsens Fellowship, 1928–29. Married 1) Åse Thiis, 1928; 2) Grete Prytz, 1945; 3) Hanne Refsdal, 1965; 3 daughters. Architect in the offices of Bryn and Ellefsen, Oslo, 1926–27, and Arneberg and Poulsson, Oslo, 1928. In private practice with Sverre Aasland, Oslo, from 1929; established his own office, 1935. Local government architect, Kristiansund, Norway, 1940–41; lived in Sweden during the last part of the war, 1943–45; resumed private practice, Oslo, 1945. Toured US on a Fulbright Fellowship, 1949–50, and Japan,

1960. Designed interiors and furniture from the late 1920s; designed metalwork and tableware from 1947. Teacher, and later Head of the Department of Furniture and Interior Design, National College of Art and Design, Oslo, 1934–43 and 1945–56; Professor of Architecture, Norwegian Institute of Technology, Trondheim, 1956–68. Founder of the Norwegian section of CIAM (Congrès Internationaux d'Architecture Moderne), 1950. Exhibited at several national and international exhibitions including Milan 1954, 1957 and 1960, US 1954–57 (touring exhibition), and Australia 1968–69 (touring exhibition). Awarded the Grand Prize, Triennale, Milan, 1954. Died in Cuzco, Peru, 29 August 1968.

Selected Works

Examples of Korsmo's furniture and tableware are in the Oslo Museum of Applied Art, the Nordenfjeldske Museum of Applied Art, and the West Norway Museum of Applied Art. A full list of his architectural commissions appears in *Norsk Kunstnerleksikon*, 1983.

Interiors

- 1929 Bagatelle Restaurant, Bygdøy Allé, Oslo (interior with Sverre Aasland)
- 1929 Shops, Bygdøy Allé 3 and 7, Oslo (interiors with Sverre Aasland)
- 1929–30 Korsmo Apartment, Lille Frøens vei 14, Oslo (interiors and furnishings)
- 1930 Dammann House, Havna Allé 15, Oslo (building and interiors with Sverre Aasland)
- 1930 Korsmo House, Havna Allé 12, Oslo (building with Sverre Aasland, interiors and furnishings)
- 1931 Petit Art, Drammensveien 4, Oslo (shop interior and furniture)
- 1935 Villa Riise, Hamar (building and interiors with Sverre Aasland)
- 1936 Benjamin House, Slemdalsveien 33a, Oslo (building, interiors and furnishings)
- 1937 Shop, Fridtjof Nansens plass 5, Oslo (interiors and furnishings)
- 1937 Norwegian Pavilion, World's Fair, Paris (design of the building and exhibition layouts with Knut Knutsen and Ole Lind Schistad)
- 1937 Villa Stenersen, Oslo (building and interiors)
- 1938 Vi Kan, Oslo (exhibition layout with Knut Knutsen and Andreas Nygaard)
- 1950 Korsmo Apartment, Løkenveien 12, Oslo (interiors and furnishings)
- 1952–55 Korsmo House, Planetveien 12, Oslo (building with Christian Norberg-Schulz; interiors and furnishings)
- 1954 Triennale, Milan (design of the Norwegian section)
- 1957 Triennale, Milan (design of the two Norwegian sections)
- 1961–63 Britannia Hotel, Trondheim (rebuilding and interiors with Terje Moe)

Korsmo designed custom-made furniture for his interiors from 1929. He also designed glassware, cutlery and silverware 1947–58; his silverware and cutlery were produced by J. Tostrup, Oslo. With his wife Grete Prytz Korsmo he also designed items in enamelled stainless steel for Cathrineholm.

Lace

The close association between interior design and curtains or other drapery of walls and furniture is centuries old. Bleak stone walls with glassless windows required coverings for warmth, and beds needed hangings to keep out the draughts. Many of the early furnishings were of brightly-tinted wool, silk-velvets or damasks, but long before lace became an essential part of fashion its heavier furnishing forms of knotted nets, leno weaves, drawnworks and cutworks, were being exploited for decoration and comfort.

The knotted nets (known as *filet* or *lacis*) were worked in the manner of a fishing net, the square meshes having knots at every corner. The design, often Gothic or representational in a primitive style lacking both proportion and perspective, was added by a darning or running stitch. Leno weaves were embroidered in either white linen or coloured silk threads, using similar stitches. To make the drawnworks, counted numbers of warps and wefts were drawn out in whole or in part from solidly woven linens, the design being left as areas of the original cloth, or added later yet again in a darning- or running-stitch manner. Cutworks extended this conversion of a solid fabric into openwork by the cutting out of small squares, the holes being later filled in with geometric devices – diamonds, circles and stars – worked now in detached button-hole stitches.

The earliest appearance of such work dates from 1337–39 and can be seen in the fresco of Good Government in the Town Hall of Siena, where Pax reclines against a cushion pierced at intervals with cut squares inwardly decorated.

Cutwork was often combined with *filet* in the decoration of table covers, sheets, bed hangings and valances. Not until the late 17th century did the ever-changing façade of costume-lace encroach on the more enduring world of furnishing. In a clever, deliberate and unscrupulous ploy to stop the importation of the super-expensive Venetian laces, Louis XIV and Jean-Baptiste Colbert, assisted by the architectural and interior decorative abilities of Jean Berain, Baily and Charles Le Brun, devised a new lace, based on Venetian needlelace techniques, but with a totally French discipline and symmetry of design. This was the official and exclusive “lace of France” (or *point de France*). It was draped in an obligatory manner not only over and around the necks, wrists, elbows, bodices, petticoats and skirts of the ladies or gentlemen of the Court, but also all

over the interior fittings of palaces, châteaux and manoirs, garnishing windows, beds and even baths.

During the 18th century, *point de France* was gradually superseded by the lighter Argentan needlelace. Queen Charlotte, wife of George III, wore a flounce of Argentan lace at her wedding in 1761, and a delightful painting in the Queen’s Collection shows her seated at a dressing table richly frilled with a similar flounce.

Towards the end of the 18th century fine cotton muslins began to take the place of lace in both furnishing and fashion. In Scotland and Switzerland an extensive hand-loom cottage industry produced yardages spotted with lappet woven *point d’esprits*, or with figuring wefts, their floats cut back to clarify the design. Plain-weave or gauze-weave muslins were additionally decorated by tambour embroidery or appliqué.

These lengths were hung as sash curtains, or *stores*, flat against the tall windows of the Regency period, softening the light and throwing the silk curtains which flanked them into glowing relief.

In 1809 appeared the Bobbinet machine. Powered from 1816 by water, it could produce a cotton twist-net strong enough for use as furnishing. Almost immediately it was being hand-embroidered by various techniques. This process made it relatively expensive, and it was not until the invention, reputedly in 1846, of the Nottingham Lace Curtain Machine, shortly to be powered by steam, and with automated patterning supplied by an overhead Jacquard loom, that any serious threat to the hand-loom muslin weavers appeared.

Within a few years, 100 of these machines were working in Nottingham. In 1851 some fine store curtains were exhibited at the Crystal Palace in London, each measuring 5 yards long by 2 yards wide, with a design so elaborate that between 12,000 and 15,000 Jacquard cards were required. The speed of the machine was such that a pair of curtains each 4 yards long could be produced in two hours. By the early 1860s several tons of cotton curtains were leaving Nottingham every week.

Lace curtains flourished also in the USA where they signified an elevated social status such that the adjective “lace-curtain” was defined in Webster’s Dictionary as “having social or economic standing, often used to imply ostentation or pushing parvenu traits”, thus opposing “lace-curtain Irish” to “shanty Irish” – superiority being established in that classless society by the nature and quantity of material possessions.

While many of the “classic” designs were filched from Paris

Lace used to decorate a dressing table in *Queen Charlotte with her Two Eldest Children at her Dressing Table* (detail) by Johann Zoffany, 1764

or Lille, or from antique hand-made filets, a few were distinctively British, such as the ruined castle set amid oak trees, and a herd of cows grazing in pasture near a village church – both 1853–55, by Thomas Robinson of Basford; and the cricket match with players suitably capped and flannelled, 1882–83, by Carey and Sons of Nottingham – all registered and preserved at the Public Record Office, Kew.

In 1870, Alexander Morton of Ayrshire decided to invest £1,000 in the purchase of one of these “power looms”, in spite of the opposition of his weavers who feared (correctly) that it would lead to at least their temporary unemployment.

The development of embroidery machines between 1860 and 1880 provided further competition. The Cornely, Handmachine and Schiffli could between them imitate not only the appliqué, run and tambour techniques of hand

embroidery, but also, by a chemical process, the spachtel cut-out effects used in hand-made Swiss curtains – now rapidly disappearing from the market.

As if this were not enough, for some fifty years at least a hive of domestic embroiderers had been contributing swarms of point lace, filet, Greek lace (a form of cutwork), Tenerife work, and endless crochet and knitted-lace borders for tablecloths, sheets, valances, cushions, antimacassars, place mats, towels, and of course curtains whether in the form of stores, *brise bise* or narrow strips to be hung not over but between the windows.

With the market thus in danger of becoming flooded, the enlightenment of the Arts and Crafts, and Art Nouveau movements appeared like a breath of air, stirring the stagnant folds. The gauze-weave looms, though reduced in numbers, were still

producing their own filmy coverings and hangings, and around 1890 a lovely design of poppies, based on a William Morris textile was worked at Newmilns.

But ambivalence was setting in. Lace curtains had become common, their exclusive image quite dulled. As the public demanded cheaper and cheaper goods, quality suffered. Hygienists complained that lace curtains were unsanitary, as they gathered dust. *The Upholsterer* in 1915 hit back, contending that "Curtains do not create dust. The dust comes in the window anyway. That the curtains collect it is true, and by so doing there is less dust floating in the house".

Devastating blows were dealt to this luxury trade by the economic depression of the later 1920s, and by changes in architectural style. As houses became shorter and rounder, ceilings lower, and tall sash windows reduced to bowed casements, the priority was to encourage the entry of light, rather than obstruct it with suspended patterning, however holey.

When, some decades later, a nostalgic ambience favoured the resurrection of furnishing laces, yet another competitor had appeared, the German Raschel machine. Resurrected, in the 1950s, from its Saxony graveyard by Karl Mayer of Obertshausen, it worked by a warp-knitting process, and very rapidly using strong easy-care synthetic yarns. It could make use of existing Lace Curtain designs and thus its laces could be marketed at lower cost while appearing, to the untutored eye, no different.

Commemorative panels, large or small, have always been a by-product of more practically orientated draperies. In 1871 a 4 yard long by 67 inches wide hanging was made by Enoch Shipley and Co., of Nottingham, to commemorate the proclamation of William I of Prussia as Emperor of Germany. The deep border surrounding the central group is crowded with Baroque flowers and martial symbols, subtended by an eagle with spread wings, and surmounted by a crown. The magnificent Battle of Britain panel (1944–46), and the Last Supper, were other mammoth productions.

Today muslin curtaining and bed covers of patterned Madras gauze, are made only by the firm of Morton Young and Borland of Scotland. The Nottingham Lace Curtain machine, no longer active in Nottingham, has some residual production, also in Scotland. Cornely curtains and table cloths decorated with cloth appliqué on net, or net insertions in cloth, are made in Switzerland, using partially computerised machines. A large hanging of bobbinet decorated with Schiffli embroidery was designed in 1992 by Urs Hochulei of Bischoff, St. Gallen, to hang in the Textilmuseum. Curtaining for the home aims to incite public sentiment with white or coloured country scenes of windmills, geese, labourers, fairy tale castles, emus and kangaroos.

Scatter cushions, put together from scraps of lace, round off a contemporary scene in which lace furnishings play a somewhat amorphous role. At times essential for privacy, or to complete the theme of an interior design, they form no integral part of everyday life.

Lacquer and Japanning

Lacquer is ancient in origin and comes mainly from China, Japan and India. It was first systematically imported to the West by the East India Company in the early 17th century, and soon imitated in France, Italy and England. By 1660, the trade in eastern lacquer was well established and had far-reaching significance for western design.

Contemporary records are often ambiguous; they list imports indiscriminately as Chinese, Japanese or Indian, and terms like "India work" apply equally to eastern goods and western imitations. Fashionable taste favoured Japanese lacquer, hence the term "japanning"; this term is used here to refer to all western imitations.

In the 17th century, lacquered furniture was found in the houses of the European nobility and gentry, rich merchants and East India Company officers. Exotically painted in gold and colour on black, it was a curiosity amid otherwise dark oak furniture and wainscoting. Initially, its rarity was maintained by careful marketing, but by the late 17th century, it could be readily bought from specialist "India" goods shops.

Inventories often listed "Indian" furniture in closets. At Tart Hall in London, for example, Lady Arundel kept a large cupboard, a chest and a small table in a closet near the drawing room, and similar items in both the parlour and the Parlour Chamber. Twenty years later, Samuel Pepys saw in the Duke of York's closet "two very fine chests covered with gold and Indian varnish, given him by the East India Company of Holland." Such gifts to influential people were commonplace among Company officers.

European buyers often adapted lacquer in order to overcome differences between eastern and western furniture styles. The "china guilt (sic) cabinet upon a frame" listed in the Earl

of Northampton's inventory in 1614, probably describes an oriental, brass-mounted, rectangular chest lined with drawers, supported on a carved European stand. By 1672, craftsmen were sent to the East "to teach the Indians how to manufacture goods to make them vendible" in Europe, and from 1684 until about 1725, furniture was sent from England for decoration.

Among the most popular imports were folding screens with incised lacquer decoration (known as Bantam work or Coromandel). Not only were they useful against draughts in large halls and bedrooms, but they could be converted, often indiscriminately, into smaller screens, mirror frames, table-tops, brackets or cabinets. John Evelyn saw them more sympathetically used in 1682, in his neighbour's elegant house where "in the hall are contrivances of japan screens instead of wainscot", with decoration showing "the manner of living and country of the Chinese". This practice facilitated the aristocratic fashion for lacquer rooms to house displays of prestigious Chinese porcelain. Whether lined with eastern or western panels, or a combination, such rooms were very European in style and arrangement. The room constructed by a Dutch japanner in about 1660 at the Schloss Rosenborg in Copenhagen, is the earliest surviving example.

The demand for lacquer exceeded supply, and in about 1660 European cabinet-makers entered into serious competition. What their varnish lacked in depth and lustre, they made up for in colour. By 1701, there were recipes for making white, blue, red, olive, chestnut, lapis lazuli, marble and tortoiseshell varnishes. Connoisseurs distinguished between the "right Japan" of the East, and its European equivalent; others, like the Duke of Hamilton, were less discriminating. Worried by the expense of "Indian" cabinets, he enquired of his wife "For my part I think a counterfeit one looks as well, so let me know if you will take such a one, or give the forty guineas."

Japanning centres developed across Europe, with England, France and Holland taking the lead; the craft developed in America too, but not significantly so until the 19th century. Exports in japanned furniture flourished between European countries. Although jappers believed their work to be wholly oriental in style, and indeed most Dutch decoration was, furniture shapes remained typically 17th-century European. Except for regional variations in shape and colour, developments were similar across Europe, and most articles of fashionable household furniture were japanned. Chairs and day-beds were rarely japanned until c.1700, as earlier shapes did not lend themselves to this decorative style, although there are notable exceptions like the set of chairs made for Ham House, Surrey, in 1683. By the mid-18th century, some Venetian rooms were entirely panelled and furnished in "japan". Bedroom furniture was seldom japanned until the late 18th century, except for dressing tables, so central to the lives of society women.

Little is known of the early history of French japanning, but from c.1730, an indigenous style developed which combined eastern and western panels. Although the panels were selected like rare woods, to be mounted in furniture, sometimes together with bronze or porcelain, the original decoration was often disfigured or obscured beneath gilt trellises. Despite this cavalier approach, French work was very fine, and commodes decorated in this manner were particularly sought by fashionable European society.

Early jappers were seldom named and few wares can be

reliably attributed. Notable exponents were Giles Grendey (1693–1780) of London; the Martin Brothers (fl.1730–c.1787) of Paris, renowned for their *Vernis Martin*; Gerard Dagly (1657–1726), who worked in Germany and in France, and his apprentice, Martin Schnell.

In England, japanned furniture enjoyed a revival in the mid-18th century when entire suites decorated *à la Chine*, were favoured, particularly for bedrooms and dressing rooms. Thomas Chippendale made several such sets, one for Badminton House, c.1755, and another in green and gilt, in about 1770, for the State Bed Chamber at Nostell Priory, where, with other original furnishings, it continues to impart a whimsical Chinese character to the room. On a less grand scale, Chippendale also japanned a green and white set of bedroom furniture for the actor David Garrick in 1770. Robert Adam also incorporated japanned furniture in some of his decorative schemes, for example at Nostell Priory, Osterley Park and the Adelphi.

By 1790, interest in japanned furniture of this type gave way to lighter woods. The focus of japanning shifted to its application to papier-mâché and tinware, and a wholly separate industry grew up.

Interest in Japanese art and design among artistic circles of the 1850s, and the Japanese displays at the International Exhibition in London in 1862, led to London firms like Farmer & Rogers and Liberty & Co. specialising in exotic eastern goods. Artists, designers, architects, and aesthetes purchased Japanese lacquered furniture and screens, occasionally furnishing entire rooms with it; Japonisme was a major design influence until the end of the century, and the market was soon flooded with flimsy, inexpensive lacquered goods made to suit popular taste.

It was not until the early 20th century that the art of "true" lacquering was successfully practised in the West. Leading exponents were Eileen Gray (1878/9–1976) and Jean Dunand (1877–1942) who worked contemporaneously in Paris, producing lacquered Art Deco-style rooms and furniture for eminent couturiers and collectors. More popularly, the extravagance of the 1920s was reflected in a vogue for high quality Italian and English reproductions of Queen Anne lacquered and japanned furniture. A stylish survival from this period, is the interior of 160 Piccadilly, London, designed by William Curtis Green in 1922 as Wolseley Motor Showroom, and adapted by him in 1926 for Barclays Bank.

In 17th-century Venice, *lacca povera* developed as an inexpensive alternative to japanning. Cut-out prints were pasted onto furniture and varnished all over – known as *découpage*, this craft is currently popular among interior designers and amateurs.

Japanning was an admired amateur accomplishment, and Stalker & Parker's *Treatise of Japanning & Varnishing*, published in 1688, was aimed primarily at this market. Dictionaries of arts and sciences fully described the japanning process, and in 1750, *The Ladies' Amusement or the Whole Art of Japanning made Easy*, Robert Sayer's volume of engravings, became a design source book for both professional and amateur jappers, and other decorative artists. This amateur interest which continued into the 19th century, is a sobering reminder that some of the more tawdry specimens of japanning

may have been added to "old" furniture by over-ambitious hands.

Selected Collections

A list of the major international museums containing collections of lacquered furnishings appears in Bourne 1984; the Herbig-Haarhaus Lackmuseum, Cologne, has major holdings of lacquer ware from around the world. Important examples of interiors decorated with lacquer survive in Denmark at the Schloss Rosenborg, Copenhagen; in Germany at the Charlottenburg Palace, Berlin, the Pagodenburg, Schloss Nymphenburg, Bavaria, and the Schloss Ludwigsburg, Württemberg, near Stuttgart; in Holland at Huis Ten Bosch, The Hague; in Italy at the Palazzo Reale and Stupinigi Palace, Turin, and the Palazzo Ca'Rezzonico, Venice; and in Russia at Monplaisir, Peterhof, St. Petersburg.

Further Reading

A useful survey of Oriental and European lacquerware appears in Bourne, 1984, which also contains a short secondary reading list for European work and a much longer bibliography for Oriental lacquerware. For a more detailed study of the European industry, including a specialist bibliography with particular emphasis on the literature pre-1900, see Huth, 1971.

La Farge, John 1835-1910

American painter, critic, stained-glass designer and decorator

John La Farge was one of the most multi-talented figures in the history of American art. His innovative and spectacular deco-

rative plans for sacred and secular buildings demonstrated not only his technical prowess but also new attitudes toward the use of stained glass. He was also one of the foremost painters and muralists of the late 19th century, and a master of magazine and book illustration as well. And as if these artistic skills were not sufficient, he was a world traveller, a gifted and engaging correspondent, and wrote inspired and original art criticism.

A great admirer of Japanese art, La Farge championed its cause in the United States, and his paintings and illustrations of his travels in the South Seas stimulated a new interest in rich and exotic flora and fauna within the decorative arts. La Farge's circle of close friends included Henry James and Henry Adams, and he was considered to be one of the great conversationalists of his era. In view of the importance of his writings, which covered most aspects of the fine and decorative arts, he can be regarded as one of the most influential artists and critics in the English-speaking world. Even so, his work was almost completely forgotten by a world torn between abstraction and social realism soon after his death, and the richness and variety of his art has only recently regained public and critical attention.

La Farge began painting decorative and figurative murals around 1865 but it was not until he received the commission to plan and execute the full range of decorations for H.H. Richardson's major work, Boston's Trinity Church, that he established a reputation in this genre. This work was carried out in 1876 and La Farge took the audacious step of undertaking to complete almost all of the complex scheme, with his assistants, while the contractor's scaffolds were still in place within a period of roughly four months. He produced all the designs himself, and, insisting that they be executed in the old-fashioned medium of encaustic to achieve the rich effects deemed appropriate for the Romanesque Revival church, he established the workshop practices that he continued to use in mural and decorative projects for the rest of his life. Trinity also provided an influential model for the integration of architecture and decoration that was soon to be followed in the work of Arts and Crafts and Art Nouveau designers. La Farge himself frequently not only designed figurative and decorative painted schemes but also devised lighting, textile, sculpture and, of course, stained-glass programmes.

By the middle of the 19th century, stained glass had become a moribund art form in the United States and it is arguably La Farge's greatest achievement that he single-handedly rekindled interest in it both as a decorative medium and as a fine art form. And in the thirty years that passed between his first efforts in stained glass until just before his death, he was personally responsible for some 300 individual windows, for churches, institutional buildings, and private homes. La Farge's interest in this medium was originally nurtured by Richardson who offered him a free hand in selecting the subjects, designs and colours for the windows in the entrance hall of the Watts Sherman House in Newport, Rhode Island, in 1878. La Farge created a series of almost abstract floral designs that were not only extremely striking but also highly innovative and that juxtaposed the delicately painted flowers with an irregular, rectangular Japanese metal framework.

In addition to his work as a designer, La Farge was also responsible for certain technical advances in the use of stained

glass. His most effective discovery involved using a combination of traditional European pot-metal with translucent pieces of white opalescent glass. He found that when he placed the opalescent glass next to the other glass, it picked up the complementary colours and, through its modulations of tone, helped to create areas of light and shade. Equally important, the imperfections and irregularities in the white glass gave texture and richness to his windows. His work quickly became popular and he received commissions for the Memorial Hall, Harvard, and Trinity Church, as well as for the mansions of William Vanderbilt, J. Pierpont Morgan, and Samuel J. Tilden over the next three years. In 1880, he was awarded the lucrative and prestigious contract to design the stained glass for any of the mansions being fitted out or refurbished by the New York decorating firm, Herter Brothers.

La Farge developed a major glass workshop at Union Square in New York City to meet the demands of this new work. He also maintained a studio in the famous Tenth Street Studio Building from 1858 until his death. (His family home was in Newport.) He continued to experiment with glass throughout the rest of his life, constantly manipulating its textures and shapes so as to achieve different three-dimensional effects, and adding the cloisonné process to his working methods in the early 1890s. The quality of his work was so high that it has often been favourably compared with that of L. C. Tiffany, and several of La Farge's windows were attributed to Tiffany until recent research uncovered the original La Farge drawings. But, although his innovations in the spheres of luminosity and shading did much to enhance his reputation as a supreme colourist, his experiments and his perfectionism caused him substantially to exceed his budget on many of his projects. In addition, many previously admiring clients became frustrated at the time – sometimes years – that La Farge spent reworking and improving an idea: many of his projects therefore lost him money and future patronage. Nevertheless, his work remained in great demand and he attracted commissions from as far away as London. He was also awarded numerous honours and prizes in the United States.

Many factors have contributed to his high reputation today. The prominence of his clients, for example, and the significance of the buildings for which his decorative designs in paint and glass were created, have both helped to attract public and critical attention. But it is the work itself, much of which is still extant, that has played the most important part in ensuring that La Farge's richly colouristic, technically masterful and carefully integrated commissions continue to convey a boldness and genius that was far ahead of its time.

Biography

John Frederick Lewis Joseph La Farge. Born in New York City, 31 March 1835, the son of wealthy French émigrés. Studied drawing with his grandfather, the miniaturist Louis Binsse de Saint-Victor (1778–1844). Educated at Mount Saint Mary's College, New York, 1853–55. Worked in a law office, New York, 1856. Travelled to Europe, 1856–57; stayed in Paris and studied briefly in the studio of Thomas Couture (1815–74). Returned to New York and practised law, 1857. Leased a studio in New York, 1858; studied painting under William Morris Hunt (1827–79), Newport, Rhode Island,

1859. Married Margaret Perry, a grand-niece of Commodore Perry, 1860: 7 children. Exhibited landscapes and still lifes from 1862. Active as a muralist and decorative artist from 1865; experimented with stained-glass techniques from 1875; patented a method for opalescent glass, 1879. Travelled in Europe and met Ford Madox Brown, Dante Gabriel Rossetti and Edward Burne-Jones, London, and Puvis de Chavannes, Paris, 1874–75. Supplied stained glass for Herter Brothers, c.1880–82; established his own firm of interior decorators and stained-glass manufacturers, La Farge Decorative Art Company, New York, 1883–85. Travelled to Japan, 1886; first tour of the South Seas, 1890. Medallist, 1889 Paris Exhibition. In close contact with Siegfried Bing, 1894. Published several books and theoretical treatises on art, decoration and stained glass. Member, American Watercolor Society, 1868; National Academy of Design, 1869. Received an honorary degree from Yale University 1901; awarded medal, Architectural League, New York, 1909. Died in Providence, Rhode Island, 14 November, 1910. Major retrospective exhibition, Museum of Fine Arts, Boston, 1911.

Selected Works

The La Farge Family Papers, including correspondence and manuscripts, are in the Department of Manuscripts and Archives, Sterling Memorial Library, Yale University, New Haven. Additional material compiled by La Farge's biographer Royal Cortissoz, including notes of meetings and conversations and a copy of La Farge's unfinished memoir, is in the Collection of American Literature, Beinecke Rare Book and Manuscript Library, Yale University. Examples of La Farge's stained glass are in the Museum of Fine Arts, Boston, Brooklyn Museum and Metropolitan Museum of Art, New York, and National Museum of American Art, Smithsonian Institution, Washington, DC. Cartoons and designs for stained glass are in the Metropolitan Museum of Art.

Interiors

- 1876 Trinity Church, Boston (murals and architectural motifs; building by H.H. Richardson)
- 1877–78 W. Watts Sherman House, Newport, Rhode Island (stained glass for the main hall; building by H.H. Richardson)
- c.1879–80 Henry G. Marquand House, Newport, Rhode Island (reception room ceiling, and *Peonies* stained glass in the bedroom)
- 1880 Union League Club, New York (decoration of the dining room; sculptural work by A. Saint-Gaudens)
- 1881 William H. Vanderbilt House, New York (stained glass and decoration for the Japanese Parlour, with Herter Brothers)
- 1881–83 Cornelius Vanderbilt II House, New York (decoration of the dining room, and watercolor room; sculptural work by A. Saint-Gaudens)
- 1882 Frederick Lothrop Ames House, Boston (stained glass)
- 1882–83 Memorial Hall, Harvard University, Cambridge, Massachusetts (stained glass)
- 1887–88 Whitelaw Reid House, New York (decoration of the music room)
- 1893 John Hay House, Washington, DC (stained glass)
- 1893–98 Walker Art Building, Bowdoin College, Brunswick, Maine (*Athens* mural)
- 1903–05 Supreme Court Room, Minnesota State Capitol, St. Paul, Minnesota (mural decoration)

Larsson, Carl 1853–1919

Swedish designer, illustrator and painter

In 1901, the artist Carl Larsson and his wife Karin made their rural retreat, Lilla Hyttån, into their permanent home. A typical Dalarna country cottage, it was originally a gift from Karin's father. Over time, and through numerous extensions and alterations, they turned it into a total work of art representing a turning point in Swedish design history. This home stood as a role model for the new design ideal that has influenced Swedish interior design through this century.

The interiors were comfortable, homely, simple and light – mixing the heritage of Swedish design with international influences, and serving the everyday needs of a growing family. Plain walls were broken up by woodwork in contrasting colours. Red and green recur, uniting interior and exterior, as well as providing a common theme throughout. Furniture was either bought, inherited or purpose-built, and often painted in bright colours, examples of local vernacular were mixed with "upmarket" antiques, with innovative home-made textiles making a large contribution to each room's distinctive style.

All this was in stark contrast to the dark, overloaded, pretentiously historicist interiors popular with the 19th-century bourgeoisie, that emphasised appearance and social status.

A visitor entering the Larsson's drawing room would have been struck first by its brightness. Sunlight floods in through the large window, uncurtained and framed by climbing plants and geraniums. The furniture and dais bannisters are picked out in white, the seats are covered in a pattern of blue and white stripes, and rag-woven runners lie on the floorboards. Known as "The Swedish Room", it expresses the very spirit of the blond, Neo-Classical, 18th-century country interior.

In the dining room, the wall panelling is painted green with "English Red" for the fitted woodwork; the decor is completed by a settle, stained-glass lancet window frames, shelving, and stick back chairs. This was a room made for winter evenings, next to the traditional Scandinavian tiled stove. A tapestry of contrasting colour and black and white check hangs behind the settle, and on the table there is a white runner with red embroidered family tree, both by Karin Larsson. Such a dining room had never been seen before in Sweden.

Lilla Hyttån was originally attributed to Carl Larsson alone. Although he was the main force, more credit has come to be given to Karin's role – she put aside a career as a promising painter in order to raise a family of eight and run a home. She designed and wove most of the distinctive textiles, showing the twin influences of national heritage and Art Nouveau.

Numerous details at Lilla Hyttån bear witness to Karin's eye for practicality, such as the upstairs landing's stepped window ledge, allowing room for plants without obstructing the light. She also made the translucent muslin valances used throughout the house. The kitchen walls are panelled from floor to ceiling with unstained varnished pine watchboard. The sideboard was painted in a Japanese style by Carl. Karin also designed innovative furniture, such as the studio's austere rocking chair. It is said that the carpenter delivered it at night because he didn't want to be associated with such "ugliness".

Upstairs, Carl's bedroom furniture further exemplifies the unconventional. Placed in the middle of the tiny room, the white painted bed features a drop-leaf bookshelf, integral bench seat, and storage chest doubling as step. The white hangings and canopy feature Karin's sparse embroidery style. The bed as Modernist centrepiece is completed by the blanket's abstract designs. It is framed by red shelving on the white-washed walls, against which stand a pair of Queen Anne chairs.

The wall art by Carl – portraits, mottoes and floral ornament – verges on the sentimental. These are counterbalanced by Karin's more restrained style. Her *Rose of Love* hanging, showing a flower reaching to the sun, fills the doorway between the couple's bedrooms, the wall above painted with floral garlands by Carl.

The impact of the Larsson interiors would never have been so great were it not for the publication of his watercolours of domestic interiors in book form between 1896 and 1910. The most famous was *Ett Hem* (A Home) in 1899. A German anthology, *Das Haus in der Sonne* (The House in the Sun), of 1910 sold 250,000 copies in its first twelve years. Carl Larsson became world famous, and was seen as the arbiter of the correct interpretation of the Swedish ideal existence. The utopian image of domestic felicity that Lilla Hyttån and Carl

Larsson: watercolour from *Ett Hem*, 1899

Larsson's work portrays shows no hint of the dark side of their married life, such as the deaths of two children, or Carl's frequent depressions and absences.

Carl Larsson meant *Ett Hem* to be a model for domestic design, and as such it was aimed at the public at large. Or in his own words: "It is not for the exercise in vanity of showing you how I live, but rather because I feel I have gone about this matter in such a sensible way, so that I actually think it may serve as – ugh, dare I really say it outright? – a good example – now I have said it! – for many people who need to decorate their homes in a pleasant way."

The Larsson interiors provided inspiration for the reforming ideals of Ellen Key. A keen follower of William Morris, she believed that pleasant and harmonious homes had an uplifting effect on humanity. She criticised the appalling housing conditions of the poor, and rebelled against bourgeois domestic taste, when in 1899 she wrote *Beauty for All*, heralding Sweden's design reform movement.

Lilla Hyttån should also be seen within the context of the National Romantic Movement that affected the arts in the 1890s. The open air museum at Skansen, a microcosm of Swedish rural life, opened in 1891, providing a sanctuary for a threatened culture.

Throughout history, Sweden has borrowed and assimilated styles from abroad, and Lilla Hyttån is certainly no exception.

There are strong influences from the Arts and Crafts Movement. It celebrates the unity of architecture, craftsmanship and individual creativity in a spirit of creative "DIY". The Larssons were well informed about the latest international styles, and innovations from Austria, Germany, Japan and other countries, and travelled widely. They were subscribers to *The Studio* from its launch in 1893, and visited England in the 1880s. However, most importantly, the Larssons were not just recipients of the new ideals, they were also active at the forefront of the movement. It should be noted that the bedrooms and the dining room predate *The Studio*.

Today, Lilla Hyttån (also known as Carl Larssongården) is preserved more or less intact. It has been a subject of pilgrimage for professionals and public alike for a century, and still seems to have something to offer most tastes. The "Carl Larsson style" reappears regularly in furniture fairs and glossy consumer magazines. Historians are also reassessing the work of both Larssons, exemplified by the forthcoming 1997 exhibition at London's Victoria and Albert Museum.

Finally, one must note the curious irony that something so brimful of foreign design influences has become an inseparable part of Swedish cultural identity.

Biography

Carl Olof Larsson. Born in Stockholm, 28 May 1853. Entered the preparatory school of the Academy of Fine Arts, 1866; moved to the Antique School of the Academy of Fine Arts, 1869. Financed his studies by book, magazine and newspaper illustration and photography retouching. Won a number of prizes, 1872–74. Visited France, and lived at Grez-sur-Loing near Fontainebleau, 1872–75. Won Royal Medal for painting, 1876. Travelled to Paris and Barbizon, 1877. In Grez-par-Nemours, 1878, where he met Karin Bergöö; married in 1883; several children. Twice rejected at Paris Salon, 1881, 1882; but won third medal at the Salon, 1883. Returned to Sweden, 1885. Established contacts with patron Pontus Fürstenberg in Gothenburg. With other artists was opponent of the Academy. Moved to Dalarna, c.1888, settling there permanently in 1901. Painted and exhibited scenes from his family life, some exhibited, 1894–97. Some watercolours reproduced in album *Ett Hem*, 1899. Also painted large-scale oil and fresco paintings for various sites, 1896–1906. Exhibited at Paris World Fair, 1900; Artists' Association exhibition, Stockholm, and in Munich, 1901. First prize at Rome exhibition, 1911. Travelled in Finland, France and Germany, 1912. Produced tapestry designs. Died 22 January 1919.

Selected Works

The Nationalmuseum in Stockholm holds the largest collection of Larsson's painted and graphic work.

Interiors

- 1879 Bolinder Palace, Stockholm (ceiling and lunette paintings): Bolinder family
- 1888– Lilla Hyttnäs, Sundborn, Dalarna (interior decoration): Larsson's home
- c.1892 Girls' School, Gothenburg (wall paintings)
- 1896 Nationalmuseum, Stockholm (staircase fresco paintings): Nationalmuseum
- 1897–98 Royal Opera, Stockholm (ceiling and lunette paintings)
- 1898–1901 Norra Latin Läroverket, Stockholm (wall painting)
- 1903 Latinläroverket, Gothenburg (friezes)
- 1905 Dramatic Theatre, Stockholm (ceiling painting)
- 1906 Nationalmuseum, Stockholm (*Gustavus Vasa Entering Stockholm*, staircase painting)
- 1911–15 Nationalmuseum, Stockholm (*Sacrifice at the Solstice*; designs for staircase painting rejected)

Publications

Larsson's writings have been published in several editions, and translated into several languages. A complete list of his publications is in Svenska Konsthäns Lexikon.

Lasalle, Philippe de 1723–1804

French designer, manufacturer, entrepreneur, inventor and teacher

Probably the best known silk designer of the 18th century, Philippe de Lasalle led a varied and public life. Between 1744, the first year of his silk-weaving apprenticeship, and 1804, the year of his death, he resided mainly in Lyon, the centre of French silk manufacturing. His family and professional network, however, was both national and international, extending from Paris and the many provinces in France to Austria, Germany, Italy, Russia, Spain and Peru. He was designer, manufacturer, inventor and teacher, and his immediate circle included members of the legal nobility into which he married two of his daughters in 1764 and 1785. He himself achieved ennoblement in 1776, a recognition of his inventions that had resulted directly from his frustration with the weaving technology used for the production of brocaded furnishing silks with large scale patterns.

Because of the multi-faceted nature of his career, Lasalle's life is currently being reassessed in an attempt to separate fact from fiction, and interpret more accurately his role in the design and manufacture of Lyonnais silks (Miller, 1988; Chaignon, 1992). This is a complex task as Lasalle surfaced in different guises in Lyon and in Paris: in disputes with the silk weaving guild which did not appreciate his innovative turn of mind, in petitions to the monarch demanding recognition for his services to manufacturing in the form of financial remuneration (pensions), and in more arcane documentation which

reveals the breadth of his private family interests and investments. These included the judicious choice of husbands for his daughters, the ownership of property in Oullins, Sens and Seyssel, and possibly a retail outlet in Paris, and shares in coalmining and glassworks in the Auvergne (Miller, 1988; Coural, 1988).

Although it has been assumed that Lasalle's basis for excellence in design lay in a fine art training, this part of his education has not yet been traced. What is clear, however, is that he was already calling himself a designer (*dessinateur*) by the time of his marriage in 1748, a title which he never relinquished entirely. After 1749, in addition, he alternated between merchant (*marchand*), merchant manufacturer (*marchand fabricant*) and businessman (*negociant*).

Evidence of his prowess in design and manufacturing survives in the Musée Historique des Tissus in Lyon. There, point papers and fabrics reveal the foresight of his widow in offering samples of his work to the Conservatoire des Arts immediately after his death. Particularly noteworthy were the high quality and refinement of his animal, floral and human representations which show a daring mastery of realistic painterly subjects executed on the drawloom (Chaignon, 1992). These very complex large-scale subjects required painstaking reprogramming of the loom each time the repeat ran out. It was this drain on time which inspired Lasalle to produce his best known invention, the detachable simple. Shown to the Académie des Sciences in 1772, it, along with three other technical inventions, received the Prix d'honneur in 1779 (Hafta, 1977).

Although Lasalle's design output is often solely seen as impressive furnishing silks such as the *Peacocks and Pheasants*, the *Doves* or the *Partridges* (c.1771), it was not so static or restricted. Descriptions of early fabrics reveal that he dabbled in the Rococo style before turning to Neo-Classical compositions, and that fashion fabrics were also part of his repertoire. He himself claimed that his first innovation was the introduction of a tiger skin motif on a ground of gold in 1756. Both the curves of the motif and the twinkling of the metal were Rococo devices. In the 1750s he was also making other fabrics with false metallic threads for export to Germany, and in 1762 he invented a furnishing fabric made of wool, silk and linen threads as well as producing woven suit borders which were to be exported to Austria, Germany and Russia. By 1766 he was involved in another new fashion: painting on silk, and offered for sale his recipe for colours to the king (Miller, 1988). Five years later he was producing woven portraits of famous people (the Empress Catherine II of Russia, Louis XV, the future Louis XVI, the Duc de Berry, the Comte and Comtesse de Provence). These oval portraits, in a brocaded lampas on a taffeta ground, were appliquéd on to a surround of flowers in brocaded lampas on a satin ground (Chaignon, 1992). They could be hung in an interior in much the same way as paintings.

What all of these fabrics had in common was their expense, which limited them to a fashion-conscious and wealthy elite. Lasalle's customers even included Catherine II of Russia and the French king, as well as his extremely important patron, the Prince de Condé. He purchased all the fabrics for the Palais-Bourbon from Lasalle, including the well-known blue *cannelé* decorated with red partridges (Coural, 1988).

In the context of interior design, Lasalle made a lasting

contribution, as some of his fabrics still hang today in antechamber of the choir of the Pushkin Palace in Russia. As master to several designers in the 1750s and 1760s, as author of a memorial suggesting an appropriate training for designers in 1765, and as an administrator of the public school of drawing (*école gratuite de dessin*) from 1780, he also shared his expertise with the next generation. The Revolution, however, interrupted Lasalle's activity, as he lost designs, looms and home in the sack of Lyon (1793). Yet, within eight years he had reconstructed his looms and mounted them for demonstration purposes in the Grand Collège (1801). In the same year he became a member of the Académie de Lyon.

Lasalle's success, therefore, lay in his awareness and manipulation of the market for luxury silks, as well as his happy ability to convince the Crown of the value of his various inventions: he received annually pensions which rose from 600 livres in 1758 to no less than 6,000 livres in 1775 (Miller, 1988). This awareness, coupled with ambition, talent, and a drive to experiment, reveal an enquiring mind and desire for recognition fairly typical of Enlightenment entrepreneurs.

LESLEY ELLIS MILLER

Biography

Born in Seyssel, near Aix-les-Bains, 23 September 1723, the son of a civil servant. Trained as a designer of silks in Lyon and Paris, possibly attending the studio of the Lyon painter and designer Daniel Sarrahat (1666–1748). Apprenticed as a silk weaver to the textile manufacturer Jean Mazancieu, Lyon, 1744. Married Elisabeth Charryé, daughter of the designer François Charryé, 1748: 5 daughters and 1 son. Active as a designer from 1748, and as a designer, merchant, manufacturer, and entrepreneur, from 1749; resident in Lyon with a retail outlet in Paris. Worked with Charryé, 1749; associated with Camille Pernon during the 1760s; listed as independent manufacturer and dealer, Lyon, by 1779; active as a merchant in collaboration with Le Roux, Paris, from 1779. Awarded various pensions, including one of 600 livres, 1758; increased to 6000 livres, 1775. Responsible for several technical innovations and inventions; received Prix d'Honneur, Académie des Sciences, 1779; ennobled, 1776; awarded gold medal for his contributions to industry and commerce, 1783. Looms and workshops destroyed in the siege of Lyon, 1793. Member, Académie de Lyon, 1801. Died in the Palais Saint-Pierre, Lyon, 27 February 1804.

Selected Works

A large collection of Lasalle's fabrics and working drawings, including a number of order books containing designs, is in the Musée Historique des Tissus, Lyon. Additional silk hangings, upholsteries and embroideries are in the Mobilier National, Paris; examples are also displayed in the Marie-Antoinette room at Fontainebleau, and in the antechamber of the Chapel of the Pushkin Palace, Russia. Primary documents and manuscript material relating to his inventions and career are held in the Archives Nationales, Paris.

Latrobe, Benjamin Henry 1764-1820

American architect and designer of interiors and furniture

Born in England, widely travelled in Europe, and trained in engineering and architecture in London, Benjamin Henry Latrobe emigrated to the United States in 1795. There he became president Thomas Jefferson's favorite architect, and created an elegant Neo-Classical style which helped to define the culture of the new American Republic. One of the first professional architects to practise in the United States, Latrobe made a revolutionary contribution to the design of interiors by introducing the concept – then unknown in America – of the architect as designer of buildings, their interiors, and their furnishings as a unified aesthetic composition. Latrobe also introduced to America coherent theories of interior spatial sequencing and ornamentation, sophisticated European drawing techniques which focused on the design of interiors, and advanced Neo-Classical forms, furniture and color schemes. His American designs included interiors for major public buildings such as the White House and the United States Capitol, and for important private residences.

In England, Latrobe worked (from c.1787) for London architect Samuel Pepys Cockerell, who devoted great attention to interiors. He also knew the interiors of Robert and James Adam, George Dance, Henry Holland and John Soane, as well as contemporary French designs. Upon arriving in the United States, Latrobe created the first body of architectural theory in the new country. This theory guided the creation of his interiors. For example, he considered both functional needs and environmental orientation in his distribution of rooms in plan. He located major living spaces on the south for light and

warmth while segregating circulation and service spaces to the north. He introduced natural light primarily from the north and south, as he considered eastern and western light too harsh for pleasant interiors. In his spatial sequencing, Latrobe suggested that rooms be elaborated in an experiential hierarchy, so that they became more elaborate as one progressed through the plan. Latrobe also sequenced his interior spaces for effects of novelty and surprise, often creating winding, non-axial routes composed of different room shapes, surprise vistas, and marked effects of light and shadow. He called these interior effects "scenery" (derived from Robert Adam's similar use of the term) and drew their compositional principles from 18th-century Picturesque landscape theories. Latrobe's best surviving "scenic" interiors are in the John and Eliza Pope Villa in Lexington, Kentucky (1811) where one progresses from low, rectilinear spaces on the first floor, up a winding stair to a dramatic and unexpected domed rotunda and curvilinear drawing and dining rooms in the upper storey. The architect included similar "scenic" effects in his proposed designs for remodelling the interiors of the White House for Thomas Jefferson (1804, unexecuted), where visitors would have progressed through a novel variety of room shapes, column screens, and contrasts of light and shadow.

Latrobe's interior ornament was Grecian in its simplicity, but his room shapes derived from complex Roman arcuated construction and spatial types: domed rotundas, basilicas with half-domes, and groin-vaults. Though Neo-Classical, his rooms could be dramatically asymmetrical. The drawing room of the Markoe House in Philadelphia (1808, demolished) had four entirely different elevations: a segmental vault on one side, a segmental half-dome on another, a flat window wall, and a flat fireplace wall, all held in a dynamic, albeit un-classical, tension. While Latrobe's vocabulary was generally Neo-Classical, he occasionally employed other styles. He designed a full Egyptian interior for the Library of Congress within the US Capitol building (1808), and Gothic interiors for both Sedgeley, the Philadelphia villa of William Crammond (1799), and for his unbuilt Gothic project for the Baltimore Cathedral (1804). Due in part to his engineering training, Latrobe developed "rational" theories of interior construction and ornamentation. He preferred masonry structure for the complex vaulted spaces in his public buildings such as the Bank of Pennsylvania (1798), the Baltimore Cathedral, and the interiors of the US Capitol (1803-12 and 1815-17). Though his domestic interiors were constructed with lath and plaster, Latrobe made them conform to the structural "rules" of masonry construction, and "rationalized" his interior plaster ornament by recessing it below the surface so that servants could not accidentally knock it off while dusting.

In addition to his coherent theories for the design of buildings and interiors, Latrobe introduced an array of sophisticated drawing types – previously little used or understood in America – which favored the design of interiors. One technique he used was that of the room plan with "laid-back elevations". This drawing type, developed in early 18th century England by neo-Palladian architects such as Burlington and Kent, and refined by Robert Adam, consisted of a room plan with each wall laid flat around it, like a box cut at the corners. This technique allows the designer to see all the elevations simultaneously in orthographic relationship, so that they could all be

designed in unity. This drawing type also allowed for the design and inclusion of furniture as an integral part of the wall elevations. Latrobe also used reflected ceiling plans, drawn in dotted lines on his floor plans, which indicated the vaulting systems, whether masonry or plaster, which created the room shapes beneath. He also drew sections of his buildings, which allowed for the development of the interior elevations of the rooms, including mouldings, drapery and furniture. In addition, Latrobe generated dazzling perspective views of his interiors, rendered in brilliant watercolors of reds, yellows, blues and greens, a skill exhibited by no American architect before him.

Though many of Latrobe's finest interiors have been lost through demolition or remodelling, enough survive to exhibit his virtuosity. His greatest surviving public interiors are those of the original, central portion of the US Capitol, including the old House of Representatives and the Senate Chamber, splendid Neo-Classical spaces created by half-domes resting against shallow segmental arches, and lit by oculi from above. The most unorthodox space in the Capitol is that of the old Supreme Court Chamber, with its low segmental and rib-vaulted dome resting upon giant, primitive, Doric columns. Latrobe designed elaborate draperies and ceremonial furniture for these spaces, such as speakers' rostrums, presidents' chairs, canopies, and tripod lamps, mostly of a highly architectural character, and employing the Greek orders. Latrobe's most popular innovation for the Capitol interiors was his invention of new "American Orders": columns and capitals based upon native flora such as Indian maize or corn, magnolias, and tobacco. Latrobe's finest surviving domestic interior is the entrance hall of the house of Commodore Stephen and Susan Decatur, in Washington DC (1817). With its half-basilica plan, its low, segmental arches, half-dome, pendentives, niches, and "flat domed" center, all springing from a continuous frieze band which also joins the tops of all the door jambs, it is one of the most highly sculpted and fully integrated interiors designed in Federal America.

When offered the opportunity, Latrobe designed full suites of furniture for his domestic interiors. For the Philadelphia house of William and Mary Waln (1805–08), he designed an extraordinary drawing room set, including Greek *klismos*-style side chairs, Roman *lektos*-style scroll-ended sofas, window benches, card tables, and a pier table. The furniture was painted with Neo-Classical motifs in Etruscan reds, blacks, and yellow ochres with gilded highlights; a frieze in matching colors ran around the room depicting Homeric scenes drawn from the illustrations of English artist John Flaxman. The Waln furniture survives, though the house does not. Latrobe also completely redecorated and furnished several rooms at the White House, including the elliptical reception room (today called the Blue Room), for President James and Dolley Madison (1809), including mantelpieces and overmantel mirrors, *klismos*-style chairs and scroll-ended sofas, the latter with miniature, reverse-tapered Doric columns as legs. The British burned these interiors in 1814, though Latrobe's drawings for them survive. Latrobe's furniture shows an awareness of the contemporary publications of Thomas Hope, Thomas Sheraton, and Percier and Fontaine. He introduced this advanced Greco-Roman decorative style to the United States,

and the cabinet-makers he employed, such as Hugh and John Finlay of Baltimore, popularized it more extensively.

Few of Latrobe's original interiors survive, and only those in the US Capitol are completely restored to their early appearance. But with his chaste and elegant Neo-Classicism, Latrobe defined a style for Federal America, and showed the world how the citizens of a new, democratic republic might live.

PATRICK A. SNADON

Biography

Born in Fulneck, Yorkshire, England, 1 May 1764. Possibly studied at the University of Leipzig; apprenticed to the engineer John Smeaton (1724–92) c.1795; entered the office of Samuel Pepys Cockerell, London, 1787–91. Married 1) Lydia Sellon, 1790 (died 1793); 2 children; 2) Mary Elizabeth Hazlehurst, 1800; 3 daughters and 2 sons. Established his own architectural practice, London, 1791; appointed surveyor of the police offices, London, c.1792. Emigrated to the United States, 1795. Opened architectural office, Philadelphia, 1798; appointed surveyor of public buildings of America, Washington, DC, 1803 (resigned 1817). Lived in Washington, 1807–13 and 1815–18; in Pittsburgh 1813–15; in Baltimore 1818–20; moved to New Orleans, 1820. Involved in numerous engineering and speculative building schemes including canal development, pumping systems, rolling mills, textile manufacture, steamboats and real estate. Member, Academy of Arts, Philadelphia, 1805. Died of yellow fever in New Orleans, 3 September 1820.

Selected Works

Latrobe's correspondence is in the Maryland Historical Society, Baltimore. An important collection of his architectural drawings and designs is in the Library of Congress, Washington, DC. Examples of Latrobe's furniture are in the Metropolitan Museum of Art, New York, and the Philadelphia Museum of Art.

Interiors

- c.1791–94 Hammerwood Lodge, East Grinstead, Sussex (building and interiors)
- c.1791–94 Ashdown House, London (building and interiors)

Leather

Leather has featured prominently within interiors since the Middle Ages. Its principal use has been as a covering for the seats and backs of chairs, but it has also been used as a protective covering for precious objects such as caskets and globes, and, more significantly, as a luxurious type of wallhanging.

The majority of seat-covers and protective covers have been made of plain leather and were usually fairly simple in appearance and utilitarian in character. Sometimes, however, the leather was painted, or decorated with stamped patterns which might also be gilded in the same manner as bookbindings. This technique was employed in many areas of continental Europe from the 16th century onwards and many examples of stamped and gilded covers survive. A somewhat more elaborate technique, introduced in the 16th and 17th centuries, was to decorate the leather with scorched ornaments but only a few undocumented covers treated in this manner are extant. But the most luxurious covers were made of gilt leather, a material that was also used extensively in wallhangings.

Gilt leather was extremely costly to produce – only figurative tapestries were more expensive – and its use was therefore

always reserved for the most wealthy and sumptuous of interiors. Despite its name, gilt leather has nothing to do with gold but consists of rectangular leather panels (measuring on average about 24 by 20 inches) that are entirely covered with a thin layer of silver-foil. The silver-foil is fixed to the leather with parchment glue. Another coating of parchment glue, or occasionally egg white or fish glue, is then used to cover the silver-foil to prevent it from oxidizing. After the silver-foil is burnished, it is glazed with one or two layers of a translucent yellow-brown varnish. It is the combination of the clear coloured varnish on top of the silver-foil that creates the “golden” surface that is characteristic of gilt leathers. Once the gilding process was completed, further decoration could be applied using oil paints and hand-held iron tools – punches – which were used to stamp small patterns onto the gilt background to impart sparkle. Wall-coverings were formed by sewing the rectangular panels together and then nailing the combined sheets to battens fixed to the top and sides of the walls. Like tapestries and most other luxury wallhangings, gilt leather hangings were designed to hang from the cornice to the dado and were often combined with panelling.

The history of gilt leather dates back to the 6th century when decorated leather was made in Ghadâmes, a desert village in North Africa. Following the Moorish invasion of the Iberian peninsula, the technique spread northwards and by the 9th century gilt leather was being made in Spain. From the 14th century onwards its history becomes clearer and in the 16th century this branch of industry flourished and became very lucrative and *guadamecies* – a derivation of Ghadâmes – were produced in various cities including Cordoba, Barcelona, Seville, Valencia, Granada, Madrid, Jaen, Valladolid, Lerida, Ciudad Real and Ciudad Rodrigo. After 1600 the gilt leather industry in Spain declined. A gilt leather workshop still survived in Barcelona in 1791–93, but this was an exception and production had died out in most other cities by this time.

The earliest known gilt leather workshop in Italy has been traced to the end of the 15th century in the Sicilian town of Messina, and in the 16th century gilt leather makers are documented in Milan, Ferrara, Bologna, Genoa, Rome and Naples. Venice became the main centre of production, and manufacturing continued there until at least 1790.

With the decline of the Spanish industry the manufacture of gilt leathers spread northwards to the Netherlands, England and France. French workshops existed in cities such as Marseille, Carpentras, Avignon, Lyon and Rouen but, inevitably, Paris was the main centre of production, and workshops have been traced from the mid-16th century until well into the 18th century. The most important Parisian manufacturer was Jean-Baptiste Delfosse (1680–1755). The majority of gilt leather makers in England also worked in the country’s capital, London, where workshops have been documented from c.1600 to 1785. Around 1700 there was also a gilt leather maker active in Edinburgh. A speciality of English workshops was the production of painted pictorial and Chinoiserie-style gilt leather hangings. Numerous examples decorated with scenes of Chinese life were also used as screens and a spectacular set of hangings depicting episodes in the lives of Antony and Cleopatra dating from the late 17th century survives in the gallery of Dunster Castle in Somerset.

The principal centres of production, however, were in the

Leather: gilt leather wallhangings in a Netherlandish interior; painting by Gonzales Coques, c.1640

Netherlands from whence many of the finest examples of gilt leather were exported. The first documentary evidence of the production of gilt leather in the southern Netherlands dates from 1511. Many workshops were in operation in Malines from the mid-16th century onwards and the most important was the workshop belonging to the Vermeulen family (active early 17th century until 1797). During the 17th and 18th centuries gilt leather was also produced in Brussels, Antwerp, Ghent, Lille and Liège, but none of these cities ever achieved the same renown or status as Malines.

Up until the early 17th century the patterns on gilt leather hangings were either painted or stamped but in 1628, Jacob Dircxz. de Swart, a gilt leather maker in The Hague, obtained a patent for a revolutionary technique whereby repeating patterns could be embossed using engraved wooden printing moulds. The use of thin French calfskins facilitated the production of finely detailed designs and the embossed areas could be up to two or three centimetres high. The result was a wall-hanging made up of a series of leather panels, joined together and printed with identical embossed, gilded and painted decorations, whose embossed patterns stood out as golden "bubbles" and reflected the candle-light in all directions. The effect of such decorations was both novel and dramatic. Moreover, their insulating properties also made them particu-

larly suitable for the Northern climate and they were widely sought-after as luxury hangings in mercantile and aristocratic homes both within and outside the Netherlands. In the 17th century there were fourteen gilt leather workshops active in Amsterdam alone, the most important being those of Hans le Maire (active 1617–1714) and the family Van den Heuvel (active c.1632–1714), while towns such as The Hague, Utrecht, Dordrecht, and Middleburg each had one workshop, the most notable being that of the de Swart family (active 1613–81) in The Hague.

The style and decoration of gilt leather hangings obviously differed according to the period and country in which they were produced. The earliest patterns were painted on flat pieces of leather and were often inspired by, or copied from textile designs, particularly rich silk brocades. The background and gilt areas of these hangings were also often enlivened with small stamped imprints – made with hand punches – of various shapes. Following the introduction of embossing techniques new patterns emerged. These were designed by painters and silversmiths especially for the gilt leather industry and included a wide variety of floral scrolls, auricular motifs, birds and insects, cupids and figures. In the early 18th century the patterns became more formal and symmetrical in appearance, a change often attributed to the influence of the designer

Daniel Marot. Subsequently, however, Baroque style designs gave way to lighter, more informal patterns inspired by contemporary silk and chintz designs. The traditional rectangular panels were replaced by long vertical strips made up of separate panels glued together, and, simultaneously, embossed patterns increasingly made way for painted decorations with gilt backgrounds stamped with small imprints.

Despite the sumptuousness of their appearance, gilt leathers did not remain in favour much past the middle decades of the 18th century. Indeed their very richness and solidity, which, along with their durability, had originally been the very qualities that had so appealed to an upper-middle-class and aristocratic clientele, later made them less acceptable within interiors now decorated in a lighter and more informal Rococo style. They were increasingly replaced with wallpapers or painted stucco decoration and many leather hangings were discarded around this time. However, the late 19th century saw a revival of interest in this style of decoration in England and North America and numerous Aesthetic and "Old English" style interiors were hung with antique gilt leather hangings imported from Spain and the Netherlands. These antiques were not only extremely expensive but were also in quite short supply. As a result, a variety of cheaper, embossed paper alternatives, produced by wallpaper manufacturers such as Paul Balin in France and Scott Morton's Tynecastle Tapestry in England, emerged in the 1870s and 1880s whose products skilfully imitated the patterns and appearance of the leather originals.

ELOY KOLDEWEIJ

Selected Collections

A list of important specialist collections of gilt leather panels and hangings appears in Waterer 1971. The principal European collections include: in Britain, the Victoria and Albert Museum, London; in France, the Musée National de la Renaissance, Écouen, and the Musée des Arts Décoratifs, Paris; in Germany, the Deutsches Ledermuseum, Offenbach-am-Main, the Deutsches Tapetenmuseum, Kassel, and the Kunstgewerbemuseum, Dresden; in the Netherlands, the Rijksmuseum, Amsterdam; and in Spain, the Museo Municipal, Córdoba, and the Museo Nacional de Arte Decorativas, Madrid. Fine examples of gilt leathers hanging *in situ* are in the Palazzo Chigi, Ariccia; the Museum Plantijn-Moretus, Antwerp; Skokloster Castle, Balsta; Schloss Moritzburg, Dresden; Dunster Castle, Somerset; and Longleat House, Wiltshire.

Le Blond, Alexandre-Jean-Baptiste

1679–1719

French architect and designer of gardens and interiors

Although he is best known as an architect of elegant domestic residences surrounded by magnificently planted and tiered gardens, Alexandre-Jean-Baptiste Le Blond began his career as an interior designer. This was due to the influence of his first teacher Jean Le Pautre (1618–82) an engraver and ornamentalist at the court of Louis XIV. Le Blond was advised to study with Le Pautre by his father Jean, a painter to the king. A relationship between the two families would continue with the sons, since Pierre Le Pautre (c.1648–1716), one of the most important interior designers of the period, also engraved some of the works of Alexandre Le Blond.

The influence of both Jean and Pierre Le Pautre may be seen in the interior designs of Le Blond, as well as the influence of Jean I Berain (1640–1711) the designer credited with encouraging the later *Style moderne* or Rococo Style. Berain created imaginative, painted fantasies which included an array of motifs inspired by Italian murals. These consisted of ribbons, urns, garlands, hermes, sphinxes, masks, tendrils, etc. all incorporated into the framework of wooden wainscoting or ceiling panels. The contribution of Le Blond and Pierre Le Pautre was in translating these two-dimensional fantasies into three-dimensional, sculpted arabesques. The polychromatic paintings of Berain became confections in gold and white which encouraged the use of large mirrors and painted overdoors. The formerly heavy, marble cornices now blended into the white and gold scheme of the rest of the room and took on more of a decorative than architectural function.

Le Blond's interiors for the Hôtel de Vendôme (1705–06, enlarged 1714–16) and the Hôtel de Clermont (1708–14) were much admired. Mariette said of his designs "il touchait l'ornement avec une tres grande delicatessen". This "delicate touch" became well known and very influential thanks to the publication of his ornamental works in the 1710 edition of d'Avillier's *Cours d'architecture* (first published in 1691). For this new edition, Le Blond added 29 plates and 33 pages of text. A discussion of the "modern" approach to interior decor was

included under the title *Nouveaux Lambris de Menuiserie*. It was here that Le Blond promoted a carved, curved and lighter ornamental interior. In some suggestions for chimney-pieces, C-scrolls, garlands, putti and plants are gracefully incorporated into the overall design of the interior panels (*lambris*). The wide circulation of this book prompted some to credit the new style to Le Blond, but he had only refined the ideas already circulating at this time – especially those of Pierre Le Pautre who engraved the illustrations for him.

Le Blond contributed to other important publications of the period. He supplied five of the twelve plates for J.F. Felibien's *Histoire de l'Abbaye Royale de Saint-Denys en France* (1706) and was responsible for most of the third edition of Dezallier d'Argenville's *La Théorie et la Pratique du Jardinage* (1709). It was this latter work on landscape architecture that brought him to the attention of Peter the Great. Le Blond went to St. Petersburg in 1716 to help design the Tsar's new city on the Baltic. Included in Le Blond's entourage was the sculptor and interior designer Nicolas Pineau (1684–1754). Although Pineau was certainly influenced by Le Blond, his career as an interior designer would greatly outlast and overshadow that of his master. When Le Blond died of smallpox three years after their arrival in St. Petersburg, it was Pineau who continued his work there before returning to his own prominent career in France in 1727. The curved and graceful interior designs of Le Blond were still quite symmetrical and reserved. It was Pineau that brought this “modern” style into the full freedom of the Rococo (called *genre pittoresque* at the time), with elaborate and asymmetrical designs that became de rigueur for wealthy Parisian aristocrats.

Although he was not as great an innovator as either of his collaborators (Le Pautre or Pineau), Le Blond made a considerable contribution to the transition from the Baroque to the Rococo through his published writings and designs. He also contributed greatly to the overall organization and distribution of rooms in which these ornamental interiors were housed. He suggested that a gracious city residence (*Hôtel particulier*) should separate the public rooms (*appartements de parade*) from the private rooms (*appartements de commodité*) and that this organization should be based on practical rather than solely aesthetic criteria. This emphasis on comfortable, gracious living became a hallmark of Le Blond's architectural approach and included rooms that looked out on magnificent views. His carefully planned gardens included cascades, fountains and sculptural works all to be enjoyed by the residents. He is credited with popularizing the French formal garden throughout Europe, again through his publications.

Le Blond promoted a refined and elegant way of living that dominated the early half of the 18th century. The reserved elevations of his exterior façades, inspired by J. Hardouin-Mansart, opened into practically planned and comfortable rooms with gracefully carved wainscoting (*boiseries*). The whole was surrounded by a beautiful formal garden, to promote a total feeling of gracious living. Although he died in St. Petersburg shortly after the death of Louis XIV, Le Blond's works are often called Régence because they prompted the elegant and refined style associated with the regency era of the Duke of Orléans (1715–23).

KATHLEEN RUSSO

Biography

Born in Paris in 1679, the son of Jean Le Blond, a court painter. Studied under the engraver and ornemaniste Jean Le Pautre (1618–82); later trained under Jules Hardouin-Mansart (1646–1708) and André Le Nostre. Active as a designer of interiors from c.1705; designs for interior details published from 1710. Went to St. Petersburg and appointed architect-general to Peter the Great, in charge of the palace and gardens of Peterhof, 1716; his entourage included Nicolas Pineau (1684–1754). Died of smallpox in St. Petersburg in 1719.

Selected Works

Many of Le Blond's interiors are illustrated in d'Avillier's *Cours d'Architecture*, 1710.

Interiors

- 1705–06 Hôtel de Vendôme, Paris (building and interiors; enlarged 1714–16)
- 1708–14 Hôtel de Clermont, Paris (building and interiors)
- 1716–19 Peterhof Palace, St. Petersburg (designs for the palace and gardens; built posthumously with later additions by Bartolomeo Rastrelli)

Publications

- Plates for J.F. Félibien's *Histoire de l'Abbaye Royale de Saint-Denys en France*, 1706
- Plates for Dezallier d'Argenville's *La Théorie et la Pratique du Jardinage*, 1709
- Plates for A.C. d'Avillier's *Cours d'Architecture*, 1710

Le Brun, Charles 1619–1690

French architect, painter and designer

Famed as the dictator of the arts under Louis XIV and the image-builder of the greatest monarch in Europe, Charles Le Brun was the most important French artist in the second half of the 17th century. If his merits as a painter are now sometimes underestimated, his role as a skilful impresario of interior design is widely acknowledged as outstandingly significant. On

Le Brun: Galerie des Glaces, Versailles, 1678–84

the basis of Versailles alone, Le Brun's work ranks among the greatest and most celebrated decorative achievements of all time and he realised one of the grandest programmes in the glorification of monarchy that cannot fail to impress by its sheer magnitude. Yet Le Brun is often regarded as little more than a puppet in Louis XIV's cultural propaganda machine. In fact, he was an artist of energy and vision and, a resourceful courtier and servant of the king, he employed a supremely adaptable approach to interior design at Versailles, the style and vocabulary of which had been formulated in previous commissions.

The development of Le Brun's style was greatly influenced by his journey to Italy (1642–45), where he was impressed by classical antiquity and the work of the Carracci and Raphael, and by the work of Nicolas Poussin whom he accompanied to Rome, and also by contemporary exponents of the Baroque, in particular Pietro da Cortona (1596–1669). Le Brun was to use all that he had seen and studied on his return to Paris.

Le Brun embarked on his first important interior commission, the ceiling decoration of the Galerie d'Hercule (Hôtel Lambert, Paris) in about 1650. This was not only an early indication of his facility in designing on a grand scale, but an example of the new Italianate style of ceiling painting that he and other artists were introducing into France. The notion that such schemes were solely decorative, devoid of a didactic function, does not apply to Le Brun's work here or later, as the importance of the subject was integral to the formation of his decorative style. Thus the painted scenes were to be read and understood as well as aesthetically enjoyed. The shallow, coved ceiling, disproportionately low in comparison with the length of the gallery, cannot be viewed in one glance. Le Brun compensated for this by dividing the surface into three main sections. Dedicated as a whole to the Apotheosis of Hercules, one section shows the gods welcoming the hero into the skies and the other depicts Ceres and Cybele preparing his wedding banquet. The main scenes are separated by two painted "tapestries". Le Brun uses illusionistic devices to give the impression of height and volume: heavy "architecture" accentuates the breakthrough to the sky, figures appear to fly below the architectural cross-beams, and the "tapestries" sag at the edges. The most daring piece of illusion is the chariot of Hercules that charges towards the archway. Le Brun's use of mixed perspective in this ceiling is a characteristic feature of his oeuvre: for reasons of clarity the most important figures appear as if painted on a vertical (*quadro riportato*), the supporting figures are in greater perspective, and inanimate forms and objects are depicted as if seen from below (*di sotto in su*).

In 1658, Le Brun was placed in charge of the interior decorations (which included the artistic direction of the Maincy tapestry-works) of the new château of Vaux-le-Vicomte which was one of the grandest private commissions ever to have been seen in France and which is generally accepted, in terms of style and scale, as a precursor to Le Brun's subsequent work at Versailles. Some of the rooms are elaborately decorated in a style brought by Le Brun from Italy, featuring a mixture of stucco, gilding and painting. The Chambre du Roi is the most spectacular of these rooms, and suggests the influence of Pietro da Cortona's work at the Palazzo Pitti, Florence. On the ceiling and coving, high-relief stucco modelling, which includes white figures with gilded wings and drapery, heavy swags, and

lunette frames with curved volutes, contrasts with the brightly coloured or grisailles painted areas. However, while the overall richness of the interior appears to be the epitome of the Italian Baroque style, there are important stylistic differences. The more extreme techniques of illusion and foreshortening, and thus the dynamism of the Italian style, are here tempered and more static. The sculptural areas do not intrude into the painted ones which are clearly delineated with moulded frames. The central painting does not attempt to give the illusion of a view to a real sky and the figures float without any clear perspectival direction. These differences mark the compromise that was to become known as the Louis XIV style. The classical tradition and demand for controlled expression inherent in the national taste prevented Le Brun and others from simply aping or exaggerating the work of contemporary Italians.

Le Brun's use of grotesque ornament in interior design was also significant. Painted grotesque ornament was used in several rooms at Vaux, and in general continued the bold, dense and naturalistic version transmitted from Italy to France by Simon Vouet, under whom Le Brun had trained. In the *salle à manger* (c.1660) where grotesque decoration is used extensively on the wall panelling, the acanthus foliage, strapwork, fantastic creatures and drapery hanging from baldaquins are mixed with the arms and emblems (squirrels) of the Vaux-le-Vicomte's owner, Nicolas Fouquet. The novelty of Le Brun's grotesques lies in his occasional use of moulded straight bars, and scrolls of flat bandwork terminating in scrolled acanthus and connected by bars, within the decorative scheme. Similar painted and stucco ornamentation was employed by Le Brun, for example, in the Galerie d'Apollon in the Louvre (begun 1663) and grotesques also figure in the borders of his tapestry designs.

Le Brun's career reached its zenith at a significant moment in French cultural history. From 1661, Louis XIV embarked upon a programme of massive investment in architecture and all the arts which was not only intended to provide the king with splendid and magnificent surroundings but which also played a crucial role in formulating the cult of the "Sun King". The Gobelins manufactory (officially named the *Manufacture Royale des Meubles de la Couronne* and established in 1667) was created to provide every luxury necessary for the royal palaces except carpets, which were woven at the Savonnerie. Appointed the Premier Peintre du Roi in 1664, Le Brun was placed in charge of its artistic production. He was the perfect choice for this position. He had proved himself capable of designing on a grand scale and was experienced in the swift execution of all aspects of interior design. He was also an able administrator.

The Gobelins was both a school and a manufactory, and Le Brun integrated these two roles by controlling the entire output of the factory (involving some 250 workmen and including painters, sculptors, cabinet-makers, weavers, silver and goldsmiths, woodcarvers and marble workers), overseeing the training of craftsmen and artists and impressing on the organisation a corporate discipline and uniformity of style that was only possible through the domination of a single artistic temperament. Under Le Brun's leadership, the Gobelins raised standards of craftsmanship to a level unprecedented in Europe. He provided compositional drawings for all the decorative

elements in the factory's designs, but the breadth and sheer numbers of these meant that Le Brun was able to execute comparatively little painting himself. This work was carried out by his team of assistants, who were expected to remain faithful to his master drawings; all of this reflected both the principles of the leading Parisian artistic institutions and Le Brun's own classical temperament. He was also president of the Royal Academy and his domination of the arts was complete until the death of his protector – the king's minister, Jean-Baptiste Colbert – in 1683 brought Le Brun's rival, the painter Mignard to power.

The diversity of the Gobelins output is illustrated in Le Brun's tapestry – one of the suite woven between 1665 and 1678 called *L'histoire du Roi* – designed to commemorate Louis XIV's ceremonial visit to the factory in 1667 (Versailles). It shows the craftsmen presenting the king with rich furnishing fabrics, a painted canvas, floor panelling, and furniture incorporating elaborate marquetry. Le Brun himself stands behind Louis XIV on the left. Examples of the legendary silver furniture which filled the Galerie des Glaces, the Salon de la Guerre and the king's bedchamber at Versailles can be seen in the foreground. Much of this was melted down in 1689 and the rest in 1709 to provide extra coinage for the exchequer, thus destroying a major section of Le Brun's design work. Le Brun's framed cartoon of *The Passage of the Granicus* from the celebrated tapestry series of the life of Alexander the Great (1664–80) is visible in the background. Le Brun insisted on a high degree of fidelity to the design (if not the colours) of the original cartoons for his tapestries which were executed as finished oil-paintings rather than in the traditional tempera. In addition to the two sets already mentioned, Le Brun and his team devised the graceful and less majestic *Months* or *Royal Residences*. Incorporating the royal houses, landscapes and diversions of the French court, the series was woven seven times between 1668 and 1694.

It was at Versailles that the Louis XIV style reached its apogee. Attention was lavished above all on the interiors, and as *premier peintre* and *directeur* of the Gobelins, Le Brun played an integral role in their creation. The decoration of the Grands Appartements (1672–81) was based on the combination of gilded stucco and painted figurative schemes previously employed at Vaux and the Louvre, but was unprecedented in terms of its scale, richness and complexity. The walls were not decorated with the traditional painted panelling, but were covered either with polychrome marble in classical and geometric patterns, or with richly coloured patterned silk on which paintings from the royal collection were hung. Attributes of kingship and references to Apollo and the Sun proliferated. The king's Appartements were approached via the Escalier des Ambassadeurs which was one of the most elaborate and dramatic staircases in Europe. (The destruction of the official grand entrance of the palace in 1752 represents the single, most significant loss of work dating from the reign of Louis XIV at Versailles.)

Le Brun's decorations were extraordinarily opulent and complex. The lower section consisted of polychrome marble, and a sumptuous fresco adorned the upper section of the wall and ceiling. On a level with the *premier étage*, Le Brun included an illusionistic architectural framework with *loggie*, the parapets of which were hung with carpets. Behind these

parapets stood groups of figures representing the four parts of the world, a theme continued in the ceiling with four seated figures. Simulated tapestries depicting scenes of the king's military victories hung next to the *loggie*. Painted architecture which opened out to the "sky", continued into the lower section of the vault with exotic birds perched on the balustrades.

Such illusionistic balconies were included in other decorations of the Grands Appartements, an example being the present day Salle des Gardes de la Reine. Around the opening of the skylight, Le Brun depicted several scenes from contemporary history involving Louis XIV, which complemented the narrative of the tapestries below. At the centre of this panegyrical imagery was a bust of Louis XIV himself, by Jean Warin. Thus by 1679, the king was no longer represented through the iconography of the god Apollo, but in person. This important shift in self-image set a precedent also employed in the Galerie des Glaces and in the Salon de la Guerre.

Magnificent as the Grands Appartements are, they are but a fanfare to the true pièce de résistance of the palace, the famous Galerie des Glaces (1678–84). This, and the two salons at each end, were created following the designs of the architect Jules Hardouin-Mansart. The Salon de la Guerre and the Salon de la Paix are decorated with marble and gilded trophies symbolising respectively war and peace. Le Brun's ceilings continue these themes with scenes relating to recent French victories in the Dutch War. In one, the central panel shows France dressed for war and holding a protective shield bearing the portrait of Louis XIV, and, in the coves, personifications of her vanquished enemies. In the other, France is crowned by Glory, with her enemies and Christian Europe enjoying the benefits of Peace. The Salon de la Guerre is dominated by the imposing plaster relief of Louis XIV destroying his enemies, by Antoine Coysevox. The over-riding theme of both rooms is victory and supremacy.

The decoration of the Galerie des Glaces was the result of a close collaboration between Le Brun and Hardouin-Mansart. Hardouin-Mansart was probably responsible for the overall design but the precise balance of creative input remains unclear. Today, it is famous for the dazzling effect of the mirrors – perhaps also Hardouin-Mansart's decision – but to the king and his councillors, it was the ceiling that eclipsed all the other interior features. The execution of this enormous decoration (approximately 240 feet in length) can be firmly attributed to Le Brun. His first proposals for the painted areas focused on Apollo and Hercules respectively. But following the Treaty of Nijmegen (1678) which brought the Dutch War to a close and established France as the military and diplomatic victor, the king's intentions became even more self-aggrandising and the first plans, which had already been accepted, were dramatically rejected. Louis XIV was at the zenith of his power and in the prevailing atmosphere of jubilation, Le Brun was commanded to represent the king himself. The artist reputedly designed the central panel in two days, which took as its theme the king's assumption of power in 1661. As with other panels, this was executed as *quadro riportato* in a complicated mixture of history and allegory. Louis, dressed as French royalty but with Roman armour, is shown inspired by Minerva (wisdom) to look towards Glory. Around him are figures representing the benefits of peace and the achievements of the reign. The

ominous storm clouds above lead the spectator into the opposite scene of the panel, where the enemies of France (Holland, Spain and Germany) sit among arms and captives. In the other paintings, the king is shown performing glorious deeds, largely drawn from the conquests of the Dutch War and accompanied by classical divinities and personifications. These develop themes portrayed in the contemporary bas-reliefs in the Escalier des Ambassadeurs but the effect in the Galerie des Glaces is both more immediate and more powerful. The remaining decoration forms a rich pageant of painted "architecture", winged and mythological figures, garlands of flowers, and gilded moulding and stucco trophies in low relief. If the inspiration for the direct portrayal of the king came from his *conseil en haut*, the political language of the design was Le Brun's. Aggressively propagandist, and overwhelmingly vain-glorious to modern eyes, this ceiling is nonetheless a breathtaking statement of royal and artistic power.

Biography

Born in Paris, 24 February 1619, the son of Nicolas Le Brun, a master sculptor. First apprenticed as a painter to François Perrier, then to Simon Vouet, 1632. Came under the protection of Chancellor Pierre Séguier, 1634. Travelled to Rome, probably with Nicolas Poussin, under whom he studied, 1642; returned to Paris, 1645. Married Suzanne Butaye, 1647. A founder of the French Academy, 1648 (chancellor 1663, rector 1668, director 1683). Active for Nicolas Fouquet at Vaux-le-Vicomte, 1661. Ennobled, 1662. In royal service as Directeur de la Manufacture Royale des Meubles de la Couronne at the Gobelins, and director of artistic projects; designed for tapestry, sculpture, metalwork and furniture, 1662–90. Appointed Premier Peintre du Roi and curator of the royal paintings and drawings collection, 1664. Lectured at the Academy, 1667. Active at Versailles on the Grands Appartements, 1671–86, and at Marly, 1683. Died in Paris, 12 February 1690.

Selected Works

A great number of Le Brun's drawings are preserved in the Louvre, Paris.

Interiors

- 1649–50 Hôtel de Jars, Paris (chambre à l'alcôve)
- 1649–62 Hôtel Lambert, Paris (Galerie d'Hercule, ceiling): Nicolas Lambert
- 1650 Hôtel du Nouveau, Paris (ceiling paintings): Jérôme de Nouveau
- 1650s Hôtel d'Aumont, Paris (Appartement de Madame, Grande Chambre)
- 1652–53 Hôtel de la Rivière, Paris (Grande Chambre and Grand Cabinet ceilings, now Musée Carnavalet): Louis Barbier, abbé de la Rivière
- 1658 Hôtel de la Bazinière, Paris (Cabinet, antechamber): Bertrand de la Bazinière
- 1658–61 Vaux-le-Vicomte (Salon d'Hercule, Salon des Muses, Cabinet de la Maréchale, Chambre du Roi, Grand Salle Ovale; architect L. Le Vau): Nicolas Fouquet
- 1663 Louvre Palace, Paris (Galerie d'Apollon): Louis XIV
- 1672–74 Sceaux (frescoes for chapel ceiling; Pavillon de l'Aurore): Chancellor J.-B. Colbert
- 1672–78 Versailles (Escalier des Ambassadeurs; architect L. Le Vau): Louis XIV
- 1678–84 Versailles (ceilings for Galerie des Glaces, Salles des Gardes de la Reine; architect J. Hardouin-Mansart): Louis XIV

- 1683 Marly (façade designs): Louis XIV
- 1686 Versailles (ceilings for Salon de la Guerre, Salon de la Paix): Louis XIV

Le Brun designed several important tapestry series, including the *Histoire d'Alexandre* (1664–80) and the *Histoire du Roi* (1665–78).

Le Corbusier 1887–1965

French architect, painter, theorist and designer

Charles-Edouard Jeanneret who, in 1920, assumed the name of an ancestor, Le Corbusier, is arguably the most important architect of the 20th century. Known primarily for buildings and exteriors, he was also influential in the fields of furniture and interior design.

Walter Gropius, spokesman and theorist of the Modern Movement, declared that it would take an entire generation of architects to realize the visionary ideas Le Corbusier had proposed in his innumerable projects and sketches. The leading Brazilian architect Oscar Niemeyer has stated that he considers *Le Corbusier* the Leonardo da Vinci of our epoch, while the architect Eero Saarinen regarded him as the great “form giver” of Modern architecture.

Le Corbusier attended art school in his birthplace, La Chaux-de-Fonds, where he was apprenticed as an engraver and chiseller, and moved to Paris in 1908, at a time when Picasso and Braque were shaking the Establishment with their early Cubist paintings. The new aesthetics had an impact on the young Le Corbusier, who studied architecture for 15 months under the master of reinforced concrete construction, Auguste Perret, who claimed that his new structural method was destined to revolutionize architecture. Next Le Corbusier spent five months with Peter Behrens in Berlin, studying technical organization and the relationship between industry and design, before moving briefly to Josef Hoffmann's office in Vienna. Significantly, two fellow apprentices in Behrens's studio were Ludwig Mies van der Rohe and Walter Gropius. From his distinguished tutors Le Corbusier learned honesty in architectural expression and became enthusiastic about the new conception, Machine Art, in which pure geometrical forms were considered beautiful, belonging to an orderly and coherent system. Le Corbusier continued his education travelling throughout Europe, sketching and analysing everything from cathedrals to Mediterranean villages.

In 1917 he settled in Paris where he was preoccupied with painting and met Amédée Ozenfant, a fellow painter who shared his artistic philosophy. From their creative partnership was born the 1918 manifesto of Purism, *Après le Cubisme*, which called for a return to the rational, geometric foundations of Cubism. Le Corbusier and Ozenfant painted geometric compositions of anonymous, mass-produced objects such as vases, bottles, and glasses in the belief that such everyday objects represented the ultimate in design. To voice the ideas of the new aesthetics, with the poet Paul Dermée they launched the magazine *L'Esprit Nouveau*, devoted to the visual arts, architecture, engineering, music, literature, industrial design, and “l'esthétique de la vie moderne”. In it Le Corbusier published a series of “Warnings to Architects”, defining the new theory of aesthetics, which were published in 1923 in the book *Vers une architecture*. He followed his own guidelines in the designs for the Citrohan House (1920–22), exploring interlocking spaces of different but related heights, giving an uninterrupted living area in contrast to the usual single rooms. In the Ville Contemporaine project (1922) for a city of three million inhabitants, Le Corbusier laid down the principles of rational city planning, segregating pedestrian and vehicular

traffic, working and dwelling areas, amid open parks and gardens, allowing in the sun and air for healthy living. In his radical voice he compared the elegant lines of the contemporary automobile (Bugatti) with the Parthenon, to prove that the same aesthetic was in operation.

Le Corbusier presented his new ideas to the general public at the 1925 Exposition Internationale des Arts Décoratifs in Paris. He and his cousin, Pierre Jeanneret, with whom he became associated in his architectural work, were commissioned to design the French pavilion. Appropriately known as the Pavillon L'Esprit Nouveau, along with the Soviet Pavilion designed by Russian avant-garde architect Konstantin Melnikov, it was advanced and daring among the Historicist architecture of the other nations' pavilions. The Pavillon demonstrated a new way of living; it featured a full-scale model of an apartment unit from the vertical-slab mass-housing of the “superimposed villas” designed for the 1922 Ville Contemporaine. “My intention was to illustrate how, by virtue of standardization, industry creates pure forms. I wanted to stress the intrinsic value of this pure form of art that is the result,” Le Corbusier explained. In the pavilion he also took the opportunity to illustrate his theories as applied to interior architecture. The effect was deliberately sparse, with white walls decorated only by the Fernand Léger paintings. A two-storey outdoor living terrace and a two-storey living room overlooked by a balcony provided an illusion of spaciousness. All components of the unit, including the doors and windows, were based on a modular system. The standardized unit furniture, designed for mass production, included storage walls, a table made by a hospital furniture manufacturer, and the *Wiener Stuhl* (Viennese Chair) developed by Gebrüder Thonet in 1904. The chair consisted of a bentwood frame with arms and a cane seat. Le Corbusier used the chairs repeatedly in his interiors, including the Weissenhofsiedlung Exhibition houses of 1927, and made them famous all over the world.

The 1926 declaration of “Five Points Towards a New Architecture” is based on Le Corbusier's definition of the reinforced concrete column and slab system of construction called the Dom-ino, developed in 1914. A frame of columns supporting the floor and roof slabs, linked with cantilevered concrete stairs, is the only fixed part of a building. Everything else, the building skin, partitions and so forth, is non-structural and entirely flexible. Open-plan, freed from the need for load-bearing walls, it is capable of infinite variations. The Five Points principles of an independent structural skeleton and ensuing open plan has revolutionized architectural design ever since. Fundamental to the Five Points were: the supports that were spaced out at specific equal intervals to elevate the ground floor; the flat roof with its garden, enabling a city to recover its built-up areas; the free designing of the ground plan, with interior walls placed where required, each floor independent of the rest and allowing total freedom of plan; the horizontal (ribbon) window, extending between supports to light a room wall-to-wall; and free design of a façade which has no supportive function.

Le Corbusier demonstrated these design principles and his credo “the house is a machine for living in” in a series of built projects: the houses for Ozenfant, Jeanneret, La Roche, Cook, Villa Stein at Garches, two structures at the Weissenhof Exhibition, and the Villa Savoye at Poissy (1929–31). The inte-

Le Corbusier: living room and terrace, Villa Savoye, Poissy, 1929–31

rior of the Villa Besnus at Vaucresson (1922) was open plan with movable partitions to divide off the dining space. Large strips of horizontal windows caught the sun. The Villa Stein at Garches, near Paris (1927) was described as the first truly modern interior, punctuated by large columns, with built-in furniture. It was designed like the bridge of a ship; its windows running around the perimeter of the first-floor living area giving a treetop view. Later in his career Le Corbusier was to design a small church at Ronchamp which has been likened to a Byzantine chapel on an Aegean island. The poured concrete walls were thick and rounded, the windows small punched holes randomly scattered and filled with coloured glass which cast a gentle glow on the white walls.

The Villa Savoye is a complete and convincing statement of Le Corbusier's Purism in concrete and glass. A landmark of modern architecture, the design employs the Dom-ino principles, lifted from the ground, open plan, ribbon windows, roof garden, cantilevered façade, and a ramp linking the levels. The rooms, composed around a large terrace, are designed as one flowing volume rather than separate areas to be filled with furniture. The carefully placed interior pieces, designed jointly with the interior designer Charlotte Perriand, Le Corbusier's principal assistant, are integrated with architecture to be admired as a sculpture. Two-storey living rooms and a contin-

uous space of living, dining, kitchen, library, and activity areas in a home are customary today but originated with Le Corbusier.

While the Villa Savoye was on the drawingboard, Le Corbusier and Pierre Jeanneret were also remodelling the plans of a house at the Ville d'Avray. Along with Perriand, they designed for the villa built-in storage walls and three types of chairs: the *Grand Confort* armchair (1928), made from a bent tubular steel frame with loose, leather-covered upholstered cushions, manufactured by Gebrüder Thonet and reissued by Cassina from 1965; the *Chaise-longue* (1928), a bent tubular steel frame covered in ponyskin on an elongated H-form base, manufactured by Gebrüder Thonet and reissued in 1965 by Cassina; and the *Basculant* chair, (1929), manufactured by Gebrüder Thonet. In a less doctrinaire way, these chairs follow the same principles as the Bauhaus designs. While Marcel Breuer's chairs were entirely rational, technically precise, and elegant, Le Corbusier's chairs were less rational and less easy to manufacture. However, the *Chaise-longue* was an early example of ergonomic design. The movable seat section with adjustable neckrest affords an individual degree of comfort to its users. Author and architect Peter Blake has likened it to the complicated, beautifully articulated chassis of a Bugatti racing car.

At the 1929 Salon d'Automne in Paris, Le Corbusier, Jeanneret and Perriand exhibited a modern apartment with concealed lighting, laminated surfaces, furnished with their free-standing chairs and table, and a built-in storage wall with shelving, storage drawers, glass fronted display boxes, and mirrored sliding door cabinets. Here, too, Le Corbusier maintained that no interior design can be separated from the exterior design.

Throughout his career Le Corbusier was preoccupied with a proportional system of measurement. For him, ordering coherence and organizational clarity were the essential ingredients of aesthetics. He analysed the Golden Section principles of architectural order, suggesting that it was as valid today as it was in the designing of Notre Dame cathedral. In many of his projects he organized his designs with the use of Regulating Lines – parallel and perpendicular lines defining a composition of the whole and its parts.

It took Le Corbusier some 20 years to develop the proportional system known as the Modulor, related to the proportions of the human body. This was to serve the needs of mass production and facilitate prefabrication, while avoiding repetitive monotony. Several mass housing projects built after World War II were based on the Modulor. These Unités d'Habitation were erected in Marseille, Nantes-Reze, Berlin, and Briey-la-Fôret and were conceived as vertical garden cities, giving each family maximum privacy, independence and communal services, and exploiting maximum use of space.

While Le Corbusier was disappointed not to win two pivotal international competitions for large-scale buildings, the influence of the designs he entered is with us today. The two projects were the League of Nations in Geneva (1927) and the Palace of the Soviets in Moscow (1931).

From 1950 to 1957, towards the end of his life, Le Corbusier worked on the overall plan for Chandigarh, the Punjab's great new capital city, applying his theories on zoning and traffic separation, designing with great sensitivity buildings for the completed government center. His designs for tapestries for the Law Courts at Chandigarh were executed in Kashmir. His tapestry designs also appeared in the Unesco building in Paris.

If one wishes to believe that a genius is not born but made, then Le Corbusier is proof. Architect Jerzy Soltan, who worked with him for four years, described him as hard-working, totally devoted to architecture, with a rigidly organized schedule. Le Corbusier himself acknowledged the importance of the self-imposed creative regimen: "If the generations to come attach any importance to my work as an architect, it is to these unknown labors that one has to attribute its deeper meaning".

Biography

Charles-Edouard Jeanneret; adopted name Le Corbusier, 1920. Born at La Chaux-de-Fonds, near Neuchâtel, Switzerland, 6 October 1887. Moved to France, 1917; naturalised, 1930. Studied metal engraving at the School of Applied Arts, La Chaux-de-Fonds, under Charles L'Eplattenier, 1900–05. First architectural commission, 1906. Travelled to Italy and Austria, 1906–07. Worked in the office of the

architect Josef Hoffmann, Vienna, 1907; apprentice in the studio of Auguste Perret, 1908–09; worked in the office of Peter Behrens, with Walter Gropius and Mies van der Rohe, Berlin, 1910. Returned to France; established his own office, La Chaux-de-Fonds; active as a painter and engraver, 1912. Married Yvonne Gallis, 1930 (died 1957). In private practice as an architect, Paris, 1917–65; in partnership with his cousin Pierre Jeanneret (1896–1967), 1922–40; collaborated with the architect Charlotte Perriand, 1927–29; practised as Atelier des Bâisseurs (ATBAT), from 1942. Began designing furniture in association with Jeanneret and Perriand, 1927. Published numerous theoretical texts from 1918 including *Vers Une Architecture*, 1923; founder-editor, with Amédée Ozenfant and Paul Dermée, *L'Esprit Nouveau*, Paris, 1919–25. Exhibited at numerous national and international exhibitions including Salon des Artistes Décorateurs and Salon d'Automne, 1920s, Paris 1925 and 1937, UAM (Union des Artistes Modernes), 1930–33, Brussels 1935 and 1937. Founder-member, CIAM (Congrès Internationaux d'Architecture Moderne), 1928, and UAM, 1930; founded ASCORAL Group (Assembly of Designers for Architectural Renewal), 1942. Lectured extensively in Europe and United States, 1921–56. Numerous awards including Gold Medal, Royal Institute of British Architects, 1959. Died at Cap Martin, France, 27 August 1965.

Selected Works

The Le Corbusier Archives, including a vast quantity of drawings, designs, plans, photographs, notebooks and manuscript material documenting every aspect of his career, are in the Fondation Le Corbusier, Paris. For a complete catalogue of his architectural works see Boesiger, 1930–70.

Interiors

- 1916 Villa Schwob, La Chaux-de-Fonds (building and interiors)
- 1920–22 Citrohan House, Paris (designs for building and interiors)
- 1920–22 Atelier Ozenfant, Paris (building and interiors)
- 1923–25 Villa La Roche-Jeanneret (now Fondation Le Corbusier), Paris (building and interiors)
- 1923–25 Maison Jeanneret, Corseaux-Vevey, Switzerland (building and interiors)
- 1925 Exposition Internationale des Arts Décoratifs et Industriels Modernes, Paris; reconstructed Bologna (Pavillon de l'Esprit Nouveau; building, interiors and furnishings)
- 1926 Villa Cook, Boulogne-sur-Seine (building and interiors)
- 1927 Villa Stein-de-Monzie (Les Terraces), Garches (building and interiors)
- 1927 Weissenhofsiedlung Exhibition, Stuttgart (two buildings)
- 1928–29 Villa Church, Ville d'Avray (remodelling, additions and furniture)
- 1929–31 Villa Savoye, Poissy (building and interiors)
- 1929 Salon d'Automne, Paris (Equipeement Intérieur d'Une Habitation; interiors and furniture)
- 1929–33 Cité de Refuge, Salvation Army hostel, Paris (building and interiors)
- 1930 Beisteguy Apartment, Paris (remodelling and interiors)
- 1932–37 Exposition Internationale, Paris (Pavillon des Temps Nouveaux, building and interiors)
- 1935 Weekend House, Celle St.-Cloud (building and interiors)
- 1951–55 Chapel Notre-Dame-du-Haut and pilgrims' hostel, Ronchamp (building and interiors)
- 1951–56 High Court, Chandigarh, India (building and interiors)
- 1952–55 Villa Sarabhai, Ahmedabad, India (building and interiors)

Numerous additional municipal and institutional buildings until 1965.

Ledoux, Claude-Nicolas 1736–1806

French architect

An heir to the Age of Reason, Claude-Nicolas Ledoux had a revolutionary approach to design that was to influence generations to come. During his lifetime, he had a successful practice prior to the French Revolution, and after, having survived the guillotine, he began to publish a five-volume folio of his works and philosophy. Throughout his career he sought to discover the primary elements of architectural beauty. He was interested in the forms on which the classical orders were based. He extracted the basic components, the circle and square, the sphere, cube and pyramid, and found ways to juxtapose and relate these platonic geometries to create dramatic, dynamic and monumental artistic effects. Ledoux was not one to think small, ridding his designs of unnecessary details, and often exceeding his clients' budgets.

Ledoux was interested in the use of common materials. For him, luxurious materials such as marble would camouflage the essential nature of his forms. His palette was filled with raw surface materials. He was transfixed by surfaces which were large enough to engage the imagination, by stones whose color stood up to comparisons with the finest marbles, by compositions which developed unexpected effects for the viewer. Ledoux continually edited his work, finally allowing only those elements of the design which were absolutely necessary to his composition.

Ledoux shared an enthusiasm for theoretical, formal design with fellow student Etienne-Louis Boullée (1728–99). Both studied with the classicist Jacques-François Blondel, and both are referred to as French Visionary Architects. But unlike Boullée who was content to explore these ideas on paper, Ledoux wanted to see his projects built. His first professional commission was the interior design of a Paris coffeehouse, the Café Militaire (1762). Ledoux created a fictional narrative to

unify his decoration. He imagined that soldiers, having been victorious on the battlefield, found a resting place in the forest. He created the effect of twelve triumphal columns around the room with patterns of spears bound together with laurels of victory and crowned with helmets. Mirrors throughout the café infinitely repeated the columns and wooden panels, carved with relief patterns of trophies and shields, reinforced the motif. In this clearing in the forest, café-goers would be reminded of their Gallo-Roman ancestry. This subject suggests Ledoux's interest in the popular debate of his day, the search for origins. The project also exemplified Ledoux's use of literary allusion as a way of giving social and aesthetic meaning to his work.

The work was well-received and led to his first major architectural commission, a large town house for the Comte d'Hallwyl. The Hôtel d'Hallwyl (1766) exemplified Ledoux's desire to bring the country home into the city and his rejection of Rococo in favor of Neo-Classicism. Constrained by the existing building plan, Ledoux's interior decoration was drawn from classical iconography. The main salon was given a country look with images of chimeras holding lyres. The rear garden court design was based on a Roman atrium house. An arcade of unfluted Doric columns defined a path around the center courtyard. A fountain niche framed by rusticated pilasters with giant capitals was centered on the back garden wall. On a blank wall across rue de Montmorency, Ledoux painted a rural landscape. Using this *trompe-l'oeil* technique he was able to suggest the illusion of the country from this shallow, urban courtyard.

At the Hôtel d'Uzès two years later, Ledoux returned to the military theme of the café. The triumphal gateway at the entry introduced the subject matter of the interior motifs. The salon de campagne was elaborately carved with trees extending floor to ceiling. Trophies and other emblems of war and peace hung from the trees in this magical forest. Ledoux often collaborated with a group of skilled artisans for his carvings. The highlight of Jean-Baptiste Boiston and Joseph Métivier's work on the Hôtel d'Uzès was the relief carvings on the four doors of the main salon which were designed to represent the four corners of the world. Symbolizing world unity, the doors displayed crocodiles for the Americas, dromedaries for Asia, elephants for Asia and horses for Europe.

The Hôtel de Montmorency in Paris, built in 1769–71, shows the beginnings of the influence of English Neo-Palladianism in Ledoux's work. The centralized, square plan was given a twist; its main entrance was situated at the angled corner of the building and the rooms were placed symmetrically about the diagonal. The main salon, located above the entrance, was decorated with panels engraved with the nine Greek muses, cupids and vases. These images symbolized the relationship between art and science.

Mme. du Barry became one of Ledoux's most important patrons. She commissioned him to design the Pavillon de Louveciennes in 1771 and in 1773 Ledoux was named architect to King Louis XV. Ledoux also dreamed of building an "ideal" city, the City of Chaux. He made plans and drawings of the various individual buildings of this utopia, but only those for the Royal Saltworks, Arc-et-Senans (1774–79), were executed. It was his most ambitious work, a utilitarian build-

ing conceived as a circular complex at the heart of his proposed visionary city.

Work came to a halt during the French Revolution, during which Ledoux was arrested and nearly put to death. In 1795, after he was freed, he spent his time participating on academic juries and preparing a five folio volume edition of his work, *L'Architecture Considérée Sous le Rapport de l'Art, des Mœurs et de la Législation*, which was dedicated to Tsar Alexander I. The folios contain idealized versions of Ledoux's work, as he modified his drawings to demonstrate the purity of his ideas and designs. Ledoux succeeded in publishing two-thirds of his engraved plates in 1804, two years before he died. In 1847, Daniel Ramée published the remaining plates.

In relating his theory on the relationship between architecture and painting, Ledoux declared: "If you want to become an architect, begin by being painter. What a variety of shapes you will find spread upon the still surface of a wall, though its pictorial eloquence may leave the apathetic multitude unmoved! High courses of stonework deeply grooved, walls rough-hewn or rusticated, pebbles sticking out, stones piled up artlessly – such elements are often enough to produce a striking effect." Ledoux himself found innate beauty in the surface of limestone and granite and saw an inexpressible joy in the dramatic distribution of simple planes and volumes.

Ledoux's commentaries often display his passion and enthusiasm for his work rather more than they enlighten the reader on the theoretical construct of his art. Nevertheless, there are some worthy passages including the statement that "no doubt, knowledge of all that has preceded us is necessary; it guides our solutions as it guarantees our memories. But rarely does such knowledge lift us to the fine frenzy that stirs and spurs an observer with a taste for what is new." With grandeur and simplicity, Ledoux sought to create what was new by understanding the essence of what had gone before.

SALLY L. LEVINE

Biography

Born in Dormans, Champagne, 27 March 1736. Entered Collège de Beauvais, Paris; apprenticed to an engraver; studied architecture at the École des Arts, Paris, under Jacques-François Blondel, 1753–58. Married Marie Bureau, 1764 (died 1792): two daughters. Active as an architect in Paris from c.1760; attached to the department, Eaux de Forêts de France, 1760s; employed as inspector of saltworks, Franche-Comté; appointed Architect de Roi, 1773; worked as architect for the Ferme Générale and designed the Barrières de Paris, 1784–89. Member, Académie Royale d'Architecture, 1767; promoted to the first class, 1792. Imprisoned for royalist sympathies, 1793–94. Concentrated almost solely on writing and projects for an ideal city after 1794. Declared bankrupt, 1805. Died in Paris, 19 November 1806.

Selected Works

The largest collection of Ledoux's papers and drawings is in the Archives Nationales, Paris. Additional drawings and documents are in the Bibliothèque de Besançon, the Bibliothèque Nationale, Paris and the Bibliothèque de la Ville de Paris. Carvings from the Café Militaire, and the salon from the Hôtel d'Uzès are displayed in the Musée Carnavalet, Paris.

Interiors

- 1762 Café Militaire, rue St. Honoré, Paris (interior decoration)
- 1766 Hôtel d'Hallwyl, Paris (building and interiors): Franz-Joseph d'Hallwyl

- 1768 Hôtel d'Uzès, Paris (renovations, remodelling and interiors)
- 1769–71 Hôtel Montmorency, Paris (building and interiors, including sculptures and carvings by Feuillet and Métivier): Claude-Martin Goupy
- c.1769–71 Château de Bénouville, Normandy (building and interiors): Marquis de Livry
- 1771–73 Pavillon, Louveciennes (building and interiors, including sculptures and carvings by Feuillet and Métivier): Mme. du Barry
- 1771–73 Pavillon Guimard, Paris (building and interiors, including sculptures by Feuillet): Mlle. Marie-Madeleine Guimard
- 1771–73 Pavillon Tabary, Paris (building and interiors)
- 1771–73 Théâtre (apartment of Mlle. Guimard), Paris (interiors)
- 1772 Hôtel des Équipages, Versailles (building and interiors): Mme. du Barry
- 1775–79 Théâtre, Besançon (building and interiors)
- 1778–81 Hôtel Thélusson, Paris (building and interiors)
- 1792 Maison Hosten, Paris (building and interiors): J.-B. Hosten

Ledoux's craftsmen included the carvers Métivier and Feuillet, and the painters Callet and Le Barbier.

Le Pautre (or Lepautre) Family

French dynasty of *ornemanistes* and architects active throughout the 17th century

Jean Le Pautre (or Lepautre) was one of the most influential of design sources during the high Baroque period of Louis XIV. His works perfectly embodied the monarchical, extravagant, and assured spirit of this fertile period of the arts in France, and he can be credited with a critical role in the creation of the Louis XIV style. His immensely creative mind sought expression in the production of thousands of engraved ornamental plates as well as designs for specific interior fixtures such as chimneypieces, bed alcoves, and console tables. These engravings were published in Paris and subsequently reissued in London, Amsterdam, Augsburg, and Nuremberg, and were a chief aid in the dissemination of the French court style.

Beginning as an apprentice to his second cousin, the cabinet-maker and engraver Adam Philippon, Le Pautre developed skill in the articulation of sculptural as well as two-dimensional form. One of his first known works is the engraving of Philippon's *Curieuses Recherches* (1645) which was published in the middle of the most intense period of Italian High Baroque influence in France. Philippon had travelled to Rome during this decade, as had other Frenchmen such as Charles Le Brun (1619–90), Pierre Mignard (1612–95), and François Girardon (1628–1715), and had copied modern and antique ornament there. Of equal importance to this development was the presence in Paris at that same time of key Italian designers, particularly Stefano Della Bella (1610–64), the greatest Italian ornamental engraver of his generation.

While Le Pautre's work reflects these obvious Italian influences, it is also undeniably French in its handling of antique ornament blended with motifs from nature and purely French images such as the fleur-de-lis and cock. In this respect, Le Pautre mirrored the creative tendencies of his contemporaries, particularly Le Brun. Classical ornament was studied, but never merely copied in final compositions: it was reinterpreted and embellished with familiar and sometimes fantastic elements. A strong measure of drama was incorporated into compositions as well: for instance, Le Pautre's engravings of bed alcoves appear as views of theatre productions, replete with figures and accoutrements alluding to specific, identifiable historical and mythological episodes.

Concurrent with this generation of classical Baroque style was the increased consciousness of decorative arts in France. A few collections of architectural and ornamental engravings incorporating motifs for interior use had been published in France in the late 16th century, among them Jacques Androuet DuCerceau's *Les Plus excellens bastiments de France* of 1577 and 1579. However, intense production of designs for interior features did not occur until the 1630s, providing Le Pautre with an audience ripe for his creative designs.

The centralization of the arts in France and the establishment of Versailles as the visual expression of French political and cultural supremacy also did much to forge a niche for Le Pautre's designs. He worked for the Crown from c.1670 to 1680, and was elected member of the Academy in 1677 as "Dessinateur et Graveur". In this capacity he continued not only to create his own designs (often directly on the copper

Jean Le Pautre: engraving of design for an alcove, c.1660

plate, without preliminary sketches), but also to etch the works of contemporaries. His designs spanned both secular and ecclesiastical projects.

Among Le Pautre's best known engravings are those for chimneypieces, bed alcoves, doors, and monumental vases. He is considered by many scholars especially important in the development of the decorative chimneypiece (as opposed to the heavier hooded types), his *cheminées à l'Italienne* exhibiting a lightness which led eventually to the classic flat-fronted French version with overmantel mirror. He viewed his designs as being variously in the Roman, French, modern, and antique styles, but they are all French classical Baroque in conception. And they have an abiding energy: "French seventeenth-century pattern is never merely static; its curves are the curves of growth, its straight lines the lines of gravity" (Evans, 1931).

Jean's eldest son, Pierre (not to be confused with his cousin Pierre, the sculptor), was trained by his father as an engraver and became prominent in his own right. However, the generational difference manifested itself in a sharp contrast in style. Pierre engraved the designs of Jean Berain (1640–1710) and other *ornemanistes*, as well as the architectural plates of Jules Hardouin-Mansart (1646–1708) and Claude-Louis d'Aviler. He demonstrated an early talent for interior decoration, but it was not until 1699 when Mansart was named Surintendant et Directeur des Bâtiments du Roi, that he was given the official appointment of Dessinateur et Graveur des Bâtiments du Roi.

Pierre Le Pautre's first major assignment, to redecorate parts of the royal château at Marly, proved to be one of his most important works. Here he brilliantly reinterpreted the two-dimensional arabesques of ornamentalists such as Berain and Audran as three-dimensional framing elements of the panels. That is, he integrated decoration and architecture in a manner not seen before. By creating delicate sculptural features out of the basic constructive elements of arabesques, he eschewed the need for strong visual, architectonic devices. The result was interiors with greater vertical unification, slender and elegant proportions, and an overall lightness. In fact, according to the historian Fiske Kimball, Le Pautre's work at Marly is considered to be "the essential creative act in the genesis of the rococo", and that "the marriage of frame and filling, of moulding and surface, of structure and ornament, of geometry and fantasy, had sprung a living entity, not only deeply new, but vitally perfect" (Kimball 1943).

Le Pautre's originality and genius were recognized immediately, and he was quickly procured to make changes to the *Chambre du Roi*, the *Antichambre de l'Oeil-de-Boeuf*, the *Cabinet du Conseil*, and the *Grande Galerie* at Versailles, and later at the *Appartement du Roi* at Trianon. In the meantime, he had also provided for the Bâtiments drawings for a new altar in Notre Dame de Paris and for the choir of the cathedral of Orléans. These ecclesiastical works show a treatment very similar to the domestic projects, involving the use of truncated

angles on the panels, ovals within arches on consoles, and ornament such as rosettes, interlaces, and background mosaic, but all with an added measure of volume and stateliness.

As the organizational structure of the Bâtiments did not emphasize individual authorship of particular projects, Le Pautre's role in many royal works has traditionally been unclear. Large-scale projects were simply credited to the Surintendant; during Le Pautre's career at the Bâtiments this position was held by Hardouin-Mansart and Robert de Cotte (1656–1735), respectively. Careful study by later scholars has afforded identification, however, of drawing techniques and specific motifs which one can attribute to Le Pautre, so the oeuvre of works assigned to him has expanded, resulting in a more thorough understanding of his career. Such is especially the case with the Chapelle de Versailles, for even though Le Pautre drew and engraved the changes made there, it had not been understood to what extent he contributed to the decorative design. It is now thought that he was responsible for the apse with the high altar in addition to many individual elements such as the choir spandrels and piers, the organ case, and the doors of the chapel and vestibules.

Le Pautre's novel treatment of interiors extended to private buildings as well. He is credited with designing interiors for the Château de Bercy and the Chancellerie (or Hôtel de Pontchartrain, Paris), and with modifying parts of the Hôtel Lauzun in Paris. Le Pautre also published a few suites of engravings, those for chimneypieces being among the best known. As the fireplace had traditionally been the central architectural feature of most Northern European rooms, it was natural that its decoration assume great importance. In Le Pautre's case, the chimneypiece designs he created for Marly quickly acquired an enthusiastic audience, with many ladies of the court commissioning their own versions from him. A key feature in these designs was the creation of a tall overmantel frame which enclosed both a mirror and the painting or relief set above it, a precocious formula which would reach its maturation in the next decades.

While many of Le Pautre's creations have been lost over time, the true inheritance of his genius is in the vast realm of Rococo design. He is generally considered a father of this style, and while the evidence is not easy to ascertain for the untrained eye, serious and careful study of his works shows the impetus he gave to an entire succeeding generation of artists and designers.

MARGARET W. LICHTER

Le Pautre, Jean 1618–1682

Designer and engraver

Born in Paris in 1618. Pupil of the cabinet-maker Adam Philippon. In royal service from 1670. Elected to the Academy as "Dessinateur et Graveur", 1677. In addition to his designs for ornament and interiors, he also produced designs for ecclesiastical interiors and furniture. Engraved illustrations for other authors. His son Pierre Le Pautre was also a designer and engraver. Died in 1682.

Selected Works

- 1654–57 Hôtel Beauvais, Paris (with Antoine Le Pautre, stair-cage): Catherine Henriette Bellier
- 1656–57 Hôtel Lauzun, Paris (interiors; building by Le Vau)

Publications

Le Pautre, Antoine 1621–1679

Architect

Baptized 5 January 1621, third son of Adrien Le Pautre, a master joiner, and of Jeanne Fressant. Probably taught by his brother Jean Le Pautre, and studied with the architect Étienne Martellange (1568/9–1641), c.1640. Two sons, Pierre (1660–1744) and Jean (1648–1735) were sculptors; a third son, Claude (b. 1649), was architect-pensioner of the French Academy in Rome, 1667–69. Died 3 January 1679.

Selected Works

- 1650 Hôtel de Guéménée (petite chambre d'hiver): Princesse de Guéménée
- 1654–57 Hôtel Beauvais (stair-cage): Catherine Henriette Bellier
- 1672 Château de Seiglière de Boisfranc, Saint-Ouen: Joachim Seiglière de Boisfranc
- 1674 Château de Clagny (now replaced by J. Hardouin-Mansart's building): Madame de Montespan

Le Pautre, Pierre c.1648–1716

Engraver and interior designer

Born in Paris c.1648, the eldest son of Jean Le Pautre the Elder, with whom he trained as an engraver. Employed as Dessinateur et Graveur des Bâtiments du Roi, 1699–1716. Designed furniture and chimney-pieces for Marly and Versailles, and at the Trianon 1699–1703. Also worked in the Chapel at Versailles, 1709. Taught drawing. Engraved ornaments for several architects. Died in 1716.

Selected Works

A large number of Pierre Le Pautre's drawings and engravings are in the Bibliothèque Nationale, Paris.

- 1699 Château de Marly (Chambre du Roi, Grand Salon): Louis XIV
- 1701–11 Versailles (Chambre du Roi, Chambre du Conseil, Salon d'Hercule): Louis XIV
- 1702–06 Versailles, Trianon (Appartement du Roi): Louis XIV
- 1703 Hôtel de Pontchartrain Chancellerie (remodelled by de Cotte from old Hôtel de Lionne; interiors Le Pautre): Chancellor Pontchartrain
- 1709 Versailles, Chapel, with Vassé (organ-case, high altar, apse)
- 1712–15 Château de Bercy, Paris (begun by F. Le Vau; Grand Salon)

Lescaze, William 1896–1969

Swiss-born American architect and designer

William Lescaze played an important part in the introduction of modern architecture and interior design to the United States in the 1930s. He had a continuing role in American Modernism until his death.

Lescaze was born at Onex, near Geneva, Switzerland and graduated from architectural training at the Eidgenössische Technische Hochschule. His training under Karl Moser was an important factor in shaping his approach to design. He worked for several offices in France including that of Henri Sauvage in Paris before moving to Cleveland, Ohio to work in the firms of Hubbell and Benes and Walter MacCormack. In 1923 he established his own office in New York. Early projects included a submission in the competition for the Palace of the League of Nations in 1927 and a New York apartment for Leopold and Olga Samaroff Stokowski in 1929.

Olga Samaroff Stokowski, the wife of Leopold Stokowski the conductor of the Philadelphia Orchestra, became interested in a small experimental nursery school in a suburb of Philadelphia. She was instrumental in funding a building for the school and urged that Lescaze be employed as the architect. The resulting Oak Lane Country Day School building of 1929 was one of the first American examples of the Modernist idiom that became known as International Style. This project also brought about a partnership with George Howe (1886–1955), a well-established Philadelphia architect with a practice that worked in the eclectic, tradition-oriented vocabulary that was characteristic of Philadelphia during this period. Lescaze was

responsible for a change in Howe's thinking that made him an exponent of Modernism.

Howe had a strong relationship with the management of a Philadelphia bank, the Philadelphia Saving Fund Society (PSFS), having designed several small branch banks in "stripped classical" style for that organization. When a major high-rise building was proposed, Howe and Lescaze (with Lescaze in charge of design) proposed a modern, International Style tower unlike any building previously built in America or, indeed, anywhere else in the world. The bank management was persuaded to accept the design on logical and economic grounds, and the resulting building (1929–32), a remarkable success by any standards, became the first major example of modern architecture in the United States.

The interiors of the building used rich materials in patterns of utmost simplicity. Details were of a high order of excellence and included special furniture, even signs and clocks, all designed in the functionalist vocabulary of Modernism. The main banking room and the escalator and stairway, the public lobby serving the elevator access to the 39-storey office tower and the executive offices, boardroom and other bank facilities at the top of the tower were all designed in great detail in accordance with Lescaze's understanding of the Modernist aesthetic. Although shocking to traditionalists, the PSFS building has remained a striking example of early Modernism at its best.

Lescaze continued in a partnership with Howe until 1934. His work included several town houses in New York (including his own house of 1933–34), each with interiors complete with built-in and movable furniture and many details in the simple, unornamented manner of the International Style. Other residential projects in the United States and in England made Lescaze a continuing leader in the development of Modernism in America. Some lamps and other objects designed for PSFS and other interior projects were, for a time, produced as products available to other designers.

The Columbia Broadcasting System became a Lescaze client for the design of radio studio interiors, executive offices, graphic design and, eventually, for a building for station KNX in Hollywood (1936–38). Lescaze was one of a number of architects involved in government-sponsored housing projects of the 1930s. His Williamsburg housing project in Brooklyn, New York (1937), known as Ten Eyck Houses, is often mentioned as the best example of public housing ever built in the United States. Later housing projects such as the Manhattanville Houses, New York (1960) are competent but less distinguished examples of Lescaze's work. A large high school building for the city of Ansonia, Connecticut (1937) demonstrated the applicability of Modernism to educational building in the United States.

The 1939 New York World's Fair included Lescaze buildings for the Aviation display and for the Swiss Pavilion. The Longfellow Building in Washington, DC (1939–41) was the first modern building in that generally conservative city. Lescaze was a persuasive speaker and able writer and came to act as spokesman for the cause of Modernism in a period when the design establishment was generally highly resistant to modern concepts.

After World War II, Lescaze's practice produced a number of projects in the increasingly accepted modern idiom that

seemed less distinguished than his earlier work, perhaps because his was no longer a strikingly individualistic direction. The arrival in America of other leading European Modernists, who assumed important teaching and leadership roles, also may have been a factor in limiting the impact of Lescaze's later work and prominence.

JOHN F. PILE

Biography

Born in Onex, near Geneva, Switzerland, 27 March 1896. Educated at the Collège de Genève, to 1915 and at the Ecole de Beaux-Arts, Geneva, 1914–15; studied architecture under Karl Moser at the Eidgenössische Technische Hochschule 1914–15. Married Mary Hughes: one son. Worked on projects for the Committee for the Reconstruction of Devastated France and in the office of Henri Sauvage, Paris, 1919–20. Emigrated to the United States, 1920; worked for Hubbell and Benes, Cleveland, 1921–22, and in the office of Walter R. MacCormack, Cleveland, 1922; established his own architectural practice, New York, 1923–29; partner with George Howe in Howe and Lescaze, Philadelphia, 1929–34; principal, William Lescaze and Associates, New York, 1934–69. Designed interiors, furniture and lighting from late 1920s and remained active in the decorative arts and metalwork after World War II. Exhibited at several national and international exhibitions including the World's Fairs, New York, 1939 and 1964. Member, New York State Building Code Commission, 1949–59. Fellow, American Institute of Architects. Died in New York, 9 February 1969.

Selected Works

Interiors

- 1926 Lescaze Apartment, East 42nd Street, New York City (interiors)
- 1927–28 Jean de Sièyres Hunting Lodge, Mount Kisco, New York (building, interiors and furniture)
- 1928 Maison Bertel Beauty Parlor, Fifth Avenue, New York (interiors and furniture)
- 1928 Andrew Geller Shoe Factory, Brooklyn, New York (interiors and furniture)
- 1928 Macy International Exhibition of Art in Industry, New York City (room settings)
- 1929 Mrs. Leopold Stokowski Apartment, New York City (interiors and furniture)
- 1929 Oak Lane Country Day School, Second Street and Oak Lane Road, Philadelphia (building, interiors, furniture and fittings)
- 1929–32 Philadelphia Saving Fund Society (PSFS), Philadelphia (building, interiors and furniture; with George Howe)
- 1930–31 Frederick V. Field House, New Hartford, Connecticut (building and interiors; with George Howe)
- 1931 Headmaster's House, Dartington Hall, Totnes, Devon (building and interiors)
- 1933–34 Lescaze House and Office, 211 East 48th Street, New York City (building, interiors and furniture)
- 1936–38 Columbia Broadcasting System (CBS) Studios and Offices, Hollywood (studios, interiors and furnishings; with E. T. Heitschmid)
- 1939–41 Longfellow Building, Washington, DC (building and interiors)
- 1955 Office Building, 711 Third Avenue, New York City (building and interiors)

Lescaze's most notable furniture and products were designed for the PSFS and CBS buildings. He also designed fabrics and accessories and paintings.

Lethaby, W.R. 1857-1931

British architect, designer and theorist

William Richard Lethaby was one of the leading members of the second generation of the Arts and Crafts Movement, so admired by Hermann Muthesius in *Das Englische Haus*, which included E.S. Prior, Ernest Gimson, and the Barnsley brothers. Lethaby's reputation as a designer is disproportionate to his limited output, which all but ended after costly problems during the construction of All Saint's Church, Brockhampton, his last, and most significant work. Thereafter his influence was established through education, public bodies, and his writings. However, this influence was such that for much of the present century for a designer to be called a "Lethabite" implied a definite artistic and ethical stance.

His somewhat puritan aesthetic may well have come from his strict Bible Christian upbringing. Like Frank Lloyd Wright, Lethaby recalled how his early creativity was stimulated by paper toys a neighbour would make for him. Though he received some training during his pupilage under Alexander Lauder, the essential hit-and-miss nature of architectural training of the day ensured that Lethaby was largely self-taught. As such, and without the benefit of either an Oxbridge education or a monied background (which was commonplace among his

colleagues in Norman Shaw's office) Lethaby was a model of the Arts and Crafts designer.

Lethaby first came to the attention of Richard Norman Shaw through the former's pseudonymous entries to the regular design competitions set by the magazine *Building News*. Apart from their clear artistic ability, these show a strong grasp of the range of historicist styles currently fashionable as the hegemony of the Gothic Revival was breaking up. Called to Shaw's office as his Chief Assistant, Lethaby was responsible for much of the detailed interior work in this most fashionable of practices from 1879 until the mid-1880s.

Shaw's was a particularly appropriate office for Lethaby, for here his increasing fondness for the Elizabethan and early Northern Renaissance styles and motifs could be employed. He designed all the panelling, plasterwork, doorcases, staircases, and, what became his particular forte, fireplaces for the rebuilding of Henry Mildmay's house at Flete in Devonshire (1879-81). Similarly, the interiors of the Alliance Insurance building, London (1882), and Cragside, Northumberland (1883), are among his best of this period. The enormous white marble chimneypiece in the Drawing Room at Cragside was an accomplished exercise in its irreverent treatment of Northern Renaissance motifs, including strapwork, curly gables, putti, garlands, and arabesques all supported on columns whose exaggerated enstasis appear to be giving way under the weight of decoration.

Once in London, Lethaby's appetite for knowledge led him to enrol in the Royal Academy Schools and spend much of his spare time studying in the Victoria and Albert Museum and the British Museum. This eclectic self-education found expression in his earliest writings (later cribbed by Charles Rennie Mackintosh), as they attempted to find a way out of Revivalism, and frequently saw him moving among the advanced circles of London's Architectural Association, where he was seen as something of a progressive figure. As a founder-member of the St. George's Art Society (a forerunner of both the Art-Workers' Guild and the Arts and Crafts Exhibition Society in which he was also a key figure), Lethaby visited many of the famous Artists' Houses of the day and particularly admired Alma-Tadema's house and William Burges's Tower House. His designs for interiors, together with furniture and fireplaces, are among the earliest works he exhibited at the annual shows of the Arts and Crafts Exhibition Society.

His initial attempts to find an alternative to Revivalism culminated in his perplexing first book *Architecture, Mysticism, and Myth* (1891) which posited an ahistorical symbolism as the basis of all architecture and design in its distillation of recent anthropology and sociology. In the introduction to this important work he stated his aim as "to set out, from an architect's point of view, the basis of certain ideas common in the architecture of many lands and religions" and came up with a prescription for buildings with "ceilings like the sky, pavements like the sea, and entrances for the sun and moon" thus hoping to re-establish all buildings as symbolic microcosms of the world.

It could be reasonably expected that his own early work, once free of Shaw's office, might reflect these concerns, and in certain respects it does. However, at the same time as the book was published Lethaby came under the combined influence of William Morris and Philip Webb through the meetings of the

Society for the Protection of Ancient Buildings (SPAB). "Webb," he later wrote, "satisfied my mind about that mysterious thing we call architecture." This, together with his own puritan values, was the impetus for his spare, low-ceilinged, homely, country house interiors of the 1890s. His work for Morris & Co. on Stanmore Hall shows the clear move away from the medieval richness and historicism of Morris & Co. to a starkness relieved by the use of quality materials and sound construction which chiefly characterise his work. Where Morris and Webb's surface pattern design is shallow, Lethaby's is flat, where their palettes are limited, Lethaby's is largely white and minimal.

His independent work combines both the rational school of design approach learnt from the Art-Workers' Guild, Arts and Crafts Exhibition Society, and the SPAB, with an attempt to reintroduce meaning through planning and decoration. Accordingly, his first independent job, Avon Tyrrell for Lord Manners (a "setting-up" commission from Norman Shaw) introduces twin peacocks to the exterior chimney breast to symbolise the hearth as the central symbolic element in an interior as a place of shelter, and as a means of linking interior and exterior. The chimney breast itself, as so often with Lethaby, was a geometrical chequerboard pattern of grey and black Derbyshire marbles surmounting a plain, but deeply moulded fire surround.

The rectilinear patterns of Lethaby's fireplaces are echoed throughout the house by both the panelling and the mullions and transoms of the Elizabethan-style windows, and becomes a further means of linking interior and exterior. Believing in the integrity of the individual artist-craftsman Lethaby gave his friend Ernest Gimson a free hand to design and execute the plaster ceilings in Avon Tyrell, as in most of his houses. Elsewhere the furniture was supplied by the firm of Kenton & Co. which Lethaby had established in 1890 with Reginald Blomfield, Sidney Barnsley, Gimson, Macartney, and Mallet.

Lethaby was freed of the orderly Shavian plan in his next job, The Hurst, and his commitment to interior spaces and their detailing was assured through the Arts and Crafts practice of allowing the plan form to generate the elevations so that, for example, a Serlian window is used to light two rooms and not just the one implied externally and historically by the use of such a window type. Fenestration, and the plan form generally, is dictated by need rather than aesthetics. However, like his hero Philip Webb's Red House, these conceits also have the effect of suggesting an organic, accretative, and therefore older building than is the case, and leaves Lethaby open to the charge of deceit of the kind theoretically deplored by the Arts and Crafts Movement.

Also at The Hurst Lethaby introduced groin vaults which, like fireplaces, become a central element at once symbolic and, for Lethaby, homely. In essence, Lethaby's interiors play with archetypal forms in his subsequent commissions as they try gradually to divest themselves of any historic connotations. Like many fellow members of the Arts and Crafts Movement, Lethaby has been taken, perversely and ahistorically, to be a pioneer of Modernism which he largely dismissed as "another kind of design humbug to pass off with a shrug – ye olde Modernist style."

For most of his working life, then, Lethaby's reputation rested on his educational reforms and writings. From being

joint first Principal of the Central School of Art and Craft and founder of the Design and Industries Association, to his work on the London County Council Technical Education Board and support of the Women's Institute, he spread the Arts and Crafts philosophy of simplicity in design. Like others of his generation, he is of interest for straddling both Revivalism and Modernism. Though he participated in the radical refashioning of the former through the Arts and Crafts Movement and English Free Style, this did not lead to an automatic acceptance of Modernism but rather a rejection of what he termed "style-mongering" in favour of an "efficiency style" found through precedent and vernacular survivals.

Biography

William Richard Lethaby. Born in Barnstable, Devon, 18 January 1857, the son of a craftsman and gilder. Articled to the architect Alexander Lauder, Barnstable, 1871–77; studied at the Royal Academy Schools, London, 1880–81. Married Edith Rutgers Crosby in 1901 (died 1927). Employed in the architectural practice of Richard Waite, Duffield, Derbyshire, 1878–79; chief assistant to Richard Norman Shaw (1831–1912), London, 1879–91; active in his own architectural practice, London, from 1889. Designed furniture, cast iron and ceramics from the late 1880s; co-founder of the furniture-making co-operative, Kenton & Co., 1890 (dissolved 1892). Appointed Art Inspector to the Technical Education Board, 1894; founder and joint director, Central School of Art and Craft, London, 1896: principal, 1902–11. Professor of Ornament and Design, Royal College of Art, London, 1901–18; Surveyor of Westminster Abbey, 1906. Founder-member: St. George's Art Society, 1885; Art-Workers' Guild, 1884; Arts and Crafts Exhibition Society, 1888; Design and Industries Association, 1915; Modern Architecture Constructive Group, 1922. Member, Society for the Protection of Ancient Buildings, 1891. Published numerous books and articles on architecture and design from the 1890s; edited *The Artistic Crafts* series of technical handbooks. Died in London, 17 July 1931.

Selected Works

A substantial collection of Lethaby's drawings, including architectural and decorative designs, is in the drawings collection, Royal Institute of British Architects, London. Archive materials including manuscripts, photographs and publications, are in the Archive of the Central School of Art (now amalgamated with St. Martin's), London. Examples of Lethaby's furniture are in the Museum and Art Gallery, Cheltenham, Gloucestershire, and the Victoria and Albert Museum, London.

Interiors

- 1879–81 Flete, Devon (panelling, plasterwork and interior fittings; renovations by Norman Shaw): Henry Mildmay
- 1883 Craggside, Northumberland (interior details; building and interiors by Norman Shaw)
- 1891 Stanmore Hall, Middlesex (with Morris & Co., chimney-pieces, woodwork and some furniture): William Knox D'Arcy
- 1891 Avon Tyrrell, Christchurch, Hampshire (building, interior fittings and decoration; plasterwork designed and executed by Ernest Gimson): Lord Manners
- 1894 The Hurst, Sutton Coldfield, Warwickshire (building, interior fittings and plaster decoration): Charles Edward Mathews
- 1898–1900 Melsetter House, Hoy, Orkney Islands, Scotland (reconstruction and additions): Thomas Middlemore

- 1898–1900 Eagle Insurance Buildings, Colmare Row, Birmingham (with Joseph Ball, building, interior fittings and some furniture)
 1898–1901 High Coxlease, Lyndhurst, Hampshire (building, interior fittings and plaster decoration): Eustace Smith
 1901–03 All Saints Church, Brockhampton (building, interiors and furniture)

Lethaby's design work also included furniture for Kenton & Co. 1890–92, and designs executed by Farmer and Brindley; metalwork executed by Neuham and Waters, from 1882; and firegrates executed by Thomas Elsley, London, Yates & Heywood, Rotherham, and the Coalbrookdale Iron Co., Telford.

Le Vau, Louis 1612–1670

French architect and designer

Born in Paris and trained as an architect by his father, Louis Le Vau was a master of magnificent Baroque interior effects. Piling layer upon layer of decoration he used a team of equally skilled artists and craftsmen to create settings whose extraordinary grandeur was intended to reflect the splendour of Louis XIV and his court. His talent lay in synthesising French and foreign influences, but he has been criticised both for borrowing heavily from architects of the previous generation such as J.A. DuCerceau and Philibert de l'Orme and for imitating contemporaries like François Mansart. Nevertheless, his skills and his willingness to adapt guaranteed him success and in 1654, following the death of Jacques Lemercier, he was appointed Architecte du Roi by Louis XIV.

Le Vau's talent for interior planning is apparent in his earliest works, which show him to have been in the vanguard of the development of the Parisian hôtel. Like Mansart's Hôtel de la Vrillière (1635), Le Vau's Hôtel de Bautru (1634–37) and his Hôtel de Bretonvilliers (1638) both had long galleries running down the side of the garden and a staircase in the corner of the courtyard. Neither of these hôtels has survived, but the Hôtel Lambert, which was probably the finest of Le Vau's Paris houses, is still extant.

Work on the building of the Hôtel Lambert commenced in 1639 but the task of decorating continued over many years until c.1660. Le Vau created a dramatic sequence of spaces and exploited the Baroque concern for dramatic views through a succession of effects. Visitors emerged from the darkness of the stairs up into the vast, light stair chamber and continued along the landing and into the oval vestibule where it was possible to look through the doors of the room and all down the length of the famous Galerie d'Hercule to views of the river Seine. The Galerie is widely considered to be the finest surviving room from this period and is richly decorated with bronzed plaster wall medallions by van Obstal and ceiling paintings by Charles Le Brun depicting the Labours of Hercules. In another room, the Cabinet de l'Amour (1646), the dado contained landscape panels by Jan Asselyn, Swanevelt and Patel the Elder, and the frieze above it was decorated with mythological subjects by Romanelli, Perrier and le Sueur, while le Sueur also painted panels on the ceiling showing the Birth of Love.

In 1653, Nicolas Fouquet, the Minister of Finance, commissioned Le Vau to design his country house at Vaux-le-Vicomte. It was to be very grand, to outshine the house which Mansart had created for the rival financier, Longueuil, at Maisons. Le Vau's plan featured a large central pavilion which enclosed the domed oval *salon* and connected all the spaces on the central axis through characteristic triple-arched openings. The west wing contained Fouquet's *appartement* and the east wing housed another set of even more splendid state rooms that were intended for the king. The most ornate room was the King's bedroom where Le Brun headed a team of decorators who also included the sculptors Thibault Pousaint and Guerin. Their finest work appears on the ceiling where gilded plaster flying nymphs, putti and animals encircle painted medallions and roundels, the central roundel showing Time carrying Innocence from the sky. The decorations were completed in

Le Vau: Galerie d'Hercule, Hôtel Lambert, Paris, 1640s

1661, and on 17 August Fouquet entertained the king and members of his court at Vaux-le-Vicomte; the festivities included a comedy-ballet by Molière with sets designed by Le Brun and music by Lully, and a spectacular display of fireworks. Three weeks later Louis had Fouquet arrested for embezzlement, he confiscated Vaux-le-Vicomte, and his minister, Jean-Baptiste Colbert requisitioned Le Vau, Le Brun and the other artists and craftsmen who had created Fouquet's house to work on a similarly grand scale for the king. Later even the trees were taken from the garden and planted at Versailles.

Le Vau had been working on alterations to the Louvre since about 1656, during the course of which he demolished some of the buildings, including the wonderful interior of the Pavillon du Roi, that had been designed earlier by Pierre Lescot. After the fire of 1661, Le Vau was commissioned to rebuild the Galerie d'Apollon and in 1663 Le Brun began the decorations with the team from Vaux-le-Vicomte. These decorations set the style and scale for the work at Versailles.

Le Vau planned to envelop the old château of Versailles with new blocks, and building commenced in 1668; the work continued after the architect's death in 1670 and the decorators were led by Le Brun as before. The finest part of Le Vau's design was the Escalier des Ambassadeurs which filled a long narrow space and was lit from above. It formed a dramatic stage on the ceremonial route up to the Grands Appartements whose decorations survive although in a somewhat altered state. The mood is Italianate and the walls are composed of panels of coloured marble, parts of which were probably covered in red or green velvet and hung with Italian paintings. The king's *appartement* had seven rooms named after the seven planets. The Sun room took pride of place, the throne was placed in the room named after Apollo and each room had a painted ceiling that reflected the planet theme.

Despite Le Vau's predilection for using layer upon layer of decoration that included paintings, sculpture, and bas-reliefs, the overall effect, though sometimes rich, was always constrained and rational and never quite broke into the emotional fluidity characteristic of fully-developed Baroque design. This constraint marked the principal difference between French and Italian design in the 17th century. But having said this Le Vau always understood the importance of dramatic spatial sequences: this was his greatest strength.

Liberty & Co.

British retailer of furnishings, fashion and textiles; established 1875

Founded by Arthur Lasenby Liberty in 1875, Liberty's was one of the most well-publicised and highly respected shops of the period and, like Heal's, it played an important role in shaping and promoting a distinctively British form of progressive, middle-class taste. The shop's heyday was the 1880s and 1890s when it was closely allied to the development of fashionable Aesthetic and artistic styles of furniture, textiles and interior design. Its promotion of Middle Eastern and oriental styles was especially influential and it is still a well-known supplier of oriental carpets and furnishings and paisley shawls. The company's tradition of commissioning work from some of Britain's foremost designers also continued throughout the 20th century and it continues to exert an influence upon fashion and design today.

Arthur Lasenby Liberty was born in 1843, the son of a draper who ran a shop in Chesham, Buckinghamshire. Following a short apprenticeship with a draper in Baker Street, Liberty acquired a post in the famous Great Cloak and Shawl Emporium owned by Farmer and Rogers on Regent Street. Already interested in art and the theatre, Liberty took up his position just as the 1862 London International Exhibition was making its mark on decorative art. Along with a number of progressive artists and designers – E.W. Godwin, James McNeill Whistler and Christopher Dresser for example – Liberty appears to have been particularly attracted to the Japanese section of the exhibition. This was the first time that a large quantity of Japanese goods had been shown in Europe and, responding to the remarkable impact that they made, Farmer and Rogers took the farsighted step of buying up some of the exhibits. These formed the basis of the company's Oriental Warehouse which opened next door to the Emporium

on Regent Street. Two years after the opening of the warehouse Liberty became its manager.

From the outset, Arthur Liberty's career went hand in hand with the fashionable quest to find an alternative to the mass-produced decorative arts of Victorian England. The newly formed company, Morris, Marshall and Faulkner had exhibited for the first time in 1862 and, like Morris, Liberty believed that ordinary people's taste could be improved by allowing them access to well-made, aesthetically pleasing products. Under Liberty's management, the Oriental Warehouse attracted a clientele that included the leading artists of the day and when Farmer and Rogers refused him a partnership, it was these artists who persuaded him to set up on his own. Thereafter Liberty's fortunes were closely bound up with those of the Arts and Crafts and Aesthetic Movements, and later with Art Nouveau.

In May 1875, with help from his father-in-law, Liberty acquired half a shop at 218A Regent Street. In keeping with current fashion the shop was called East India House and, to begin with, employed three members of staff. One of them, William Judd, was asked to open the new Tudor building in 1925 and recalled at that time, "when there were only four of us – the Master, two others, and myself ... We sold just coloured silks from the East – nothing else. The sort of thing that William Morris, Alma Tadema and Burne-Jones and Rossetti used to come in and rave about" (Adburgham, 1975). These fabrics were imported from India and the Middle-East and were dyed at Merton Abbey, Surrey, first with the help of Thomas Wardle who had also worked with Morris & Co., and later at Liberty's own printing and dyeing works. Initially, the firm sold plain-coloured textiles, known as "Art Fabrics", and Liberty's great strength was in selecting the soft, pastel colours that became hugely popular with adherents of Aestheticism. From the 1880s, it also began to issue printed fabrics, at first incorporating small, traditional patterns and soon afterwards distinctive artistic designs commissioned from established designers such as C.F.A. Voysey, and L.P. Butterfield. The best-known of these was the *Peacock Feather* pattern designed by Arthur Silver (1887) which quickly became identified as one of the company's trademarks and which proved so successful that it is still printed today.

The second half of 218A Regent Street was purchased in 1877 and by 1880 the shop had become large enough to include seven departments: Silks, Embroideries, Furniture, Carpets, Porcelain, Curios and Miscellaneous. The first shop had sold made-up bamboo tables and chairs to supplement its stock of imported tables and screens, but in 1883 Liberty established its own Furnishing and Decorating Studio under the direction of Leonard F. Wyburd. The studio specialised in the production of Moorish-style furniture and fashionable cosy corners and kiosks incorporating panels of imported *musharabeyeh* latticework. Much of the in-house furniture, including the various versions of the celebrated *Thebes* stool (1884) and a range of mock-Tudor and Arts and Crafts oak cabinets, dressers, tables and chairs, was designed by Wyburd but the shop also increasingly stocked work by outside designers such as George Walton and M.H. Baillie Scott.

By 1894 the firm had become a public company with an appeal that extended far beyond the comparatively exclusive group of artists and aesthetes who had made up the original

clientele. Its success was closely interwoven with the influence of the Aesthetic Movement which had encouraged a widespread taste among the fashionable middle classes for a more self-consciously artistic style of furnishing and decoration. This style relied heavily upon furniture influenced by Japanese and Moorish examples, textiles and wallpapers that made new use of complex, conventionalised floral and foliage patterns, and numerous artistic accessories such as peacock feathers and Japanese lanterns and fans. Liberty was unique in providing not simply one or two "art" items but everything that devotees might need to decorate the whole house, and in 1894 the company was credited with having "created an entirely new taste in fabrics, dress and interior decoration, the word Liberty having become descriptive of the style ..." (Adburgham, 1975).

Liberty's was also influential in promoting a taste for the Art Nouveau design; Italian Art Nouveau has always been referred to as the *Stile Liberty* and, acknowledging the inroads made by the new style in Britain at the end of the 19th-century, the shop sold its own version of Art Nouveau furniture alongside Arts and Crafts pieces. It also began to import Dutch and Greek silver jewellery and in 1899, following the revival of interest in Celtic Art, "Liberty Cymric" was launched, Archibald Knox providing many of the designs. The cymric designs led shortly to the famous Liberty "Tudric Pewter" line.

Arthur Liberty was knighted in 1913 in recognition for his services to British applied and decorative arts; he retired from active administration of the company the following year and died in May 1917. Throughout his career he lived up to his intention, "not to follow existing fashion but to create new ones", and this directive continued to inform the shop's progress in the 20th century.

A second shop was erected on Marlborough Street behind the Regent Street building in 1924. The style of this timber-framed structure was retrogressive and matched the conservatism of much British inter-war design, including that of many of the goods that the new shop sold. But after World War II Liberty's re-emerged as an institution eager to promote innovative, quality design. Designs by Ernest Race, Robin Day, Arne Jacobsen, Gio Ponti and Vico Magistretti were all available in the shop's modern furniture department which also sold work by firms such as H.K. Furniture, S. Hille & Co., William Plunkett, Gordon Russell and O.M.K. Design. Liberty's also upheld its tradition of innovation and excellence in textile design by commissioning patterns from Modernist designers like Marianne Straub, Lucienne Day and Jacqueline Groag.

A century after the opening of the Oriental Warehouse, Liberty's once again became involved with oriental styles, selling goods such as carpets, rugs and textiles whose design reflected the growing influence of exotic, eastern fashions popularised by the hippie movement. Similarly, with the emergence of Art Nouveau and Art Deco revivals in the late 1960s and early 1970s, the company was able to refer back to its original contributions to these styles. The shop's prestige has continued to grow and, according to the journalist Fay Sweet, by 1992 "regular buying trips around the world have brought a brilliant eclecticism to the company's design and retailing. Prints are forging ahead with contemporary designs ... there

has been a return to commissioning and producing Liberty's own furniture. The link with Japan, a traditional source of goods for Liberty's, was further strengthened with the opening of the Japanese Muji shop ..." (Calloway, 1992). And at the end of the 20th century, Liberty's is successfully upholding the aims envisaged for it by its founder.

Selected Collections

The Liberty Archive is held by Westminster City Archives at the Victoria Library, London; a large collection of Liberty catalogues running from 1881 to 1949 is in the National Art Library, Victoria and Albert Museum. Important collections of Liberty textiles can be found in the Victoria and Albert Museum, and the Whitworth Art Gallery, Manchester. Examples of Liberty furniture are in the Victoria and Albert Museum. Notable designers who supplied designs for Liberty included Lindsay P. Butterfield (1869–1948), Lucienne Day (1917[–]), Christopher Dresser (1834–1904), E. W. Godwin (1833–86), Archibald Knox (1864–1933), W. R. Lethaby (1857–1931), M. H. Baillie Scott (1865–1945), Arthur Silver (1853–96), and C. F. A. Voysey (1857–1941).

Further Reading

The most recent and comprehensive history of Liberty is Calloway 1992 which includes a full list of Liberty outlets and a survey of current operations. Adburgham 1975 cites many 19th and early 20th century references and contains many descriptions of the shop recorded by employees. An account of the designers involved with Liberty's in the early years can be found in Levy 1986.

Libraries

Throughout the history of architecture, spaces designed for libraries have incorporated concerns for light, privacy and the preservation of collections in order to balance the simultaneous need for the reader's access to materials with the protection of those materials. The library has symbolized the individual pursuit of learning, and the earliest private libraries were created within domestic spaces to preserve and at the same time display collections of manuscripts and other small precious objects. The university or public library has stood for the collective expression of reading, and thus the great spaces designed for gathering in libraries usually occur in zones distinct from those containing collections. With the introduction of automation in the 1970s, work stations for computer terminals have superseded spaces formerly reserved for public catalogs.

The earliest recorded distinct library building is dated from the 3rd century BC in Philadelphus and contained a collection of papyrus rolls belonging to Ptolemy. In Rome Asinius Pollio built a library in 25 BC, and Augustus built libraries in 37 BC. In both examples, closed cases ringing perimeter walls contained books and manuscripts.

During the Italian Renaissance purpose-built libraries were often long and narrow in plan in order to provide a high ratio of perimeter windows. At the San Marco Library in Florence, designed by Michelozzo di Bartolomeo for the Medici family and constructed in 1442–44, the design illustrates the influence of Brunelleschi's Ospedale degli Innocenti, begun 23 years earlier: Ionic columns support two arcades that define three aisles of equal width. Incorporating white walls and gray stone, the barrel-vaulted center aisle and groin-vaulted side aisles create a reading room defined by light and openness.

In the Laurentian Library at San Lorenzo in Florence, built for Pope Clement VII, designed by Michelangelo and constructed in 1524–59, the celebrated vestibule or *ricetto* with its proto-Baroque stairway leads to an elongated reading room. Within the reading room, *pietra serena* pilasters define the two-tier bays, in which a smaller window crowns the larger window below it, and ceiling beams repeat the rhythm of the pilasters. The reading carrels contain benches designed for both study and storage. A rare book room was designed but not constructed.

At the Library of St. Mark's in Venice, designed by Jacopo Sansovino and constructed in 1536–53, the entrance leads to a barrel-vaulted stair that connects the ground level to the vast reading room of the *piano nobile*. Ceiling murals painted by Titian, Tintoretto and Veronese decorate the coffered low vault of the reading room.

During the 18th century the Neo-Classical interest in central forms is illustrated by James Gibbs's Radcliffe Library at Oxford University, constructed in 1739–40. Within, eight equal piers and arches carry the drum and dome, with painted decoration contributed by Artari and Bagutti. The American heir to this design is Peter Harrison's Redwood Library in Newport, Rhode Island, constructed in 1749–50, in which an octagonal skylight floats over its central reading room.

By this date private libraries had also become a standard feature within many larger, domestic houses in Europe. Prior to the 17th century books were comparatively rare and were kept

in studies, studioli or closets along with other curios and valuables. The medieval practice of storing books and manuscripts in locked chests also continued throughout this period. As printing techniques improved, however, the ownership of books became more common and there was an increasing tendency to house them in a separate library fitted out either with shelves ranged against the wall or specially built cupboards and bookcases. Many grand houses of the late 17th century included splendidly decorated rooms to house important collections; a drawing of the Duc d'Orléans's Petite Bibliothèque in the Palais Royale (late 17th century), shows richly carved built-in book cupboards, while the library at the Hôtel de Lauzun (1660) in Paris, contains an even more sumptuous arrangement with cupboards whose doors form an integral part of the intricately decorated panelling. But such rooms were also becoming more widespread in non-royal houses. The oldest surviving country-house library in England is probably that installed in the 1670s by the Duke of Lauderdale at Ham House, Surrey. This room was situated on the first floor, adjacent to the gallery; the walls were lined with open shelves and the furnishings included a set of large, wooden library steps. Other popular accessories of this period included library tables and desks, and ornamental busts, maps and globes, examples of which can be seen in an engraving of a library designed by Daniel Marot dating from the end of the 17th century and a drawing of Samuel Pepys's library of c.1693.

Until the mid 18th century, domestic libraries were primarily rooms for study, and served as a private retreat for the individual scholar or owner of the house. Increasingly, however, they were integrated into the normal life of the house; the library began to be used as a communal living room and was decorated accordingly in a more comfortable but nonetheless fashionable style. The specialist accoutrements of scholarship were replaced by more general-purpose furnishings which included elegant draperies and additional seating and tables for family relaxation. A visitor to Althorp, in Northamptonshire, which had one of the largest private collections of books in England, described the Gothic library in 1822 as containing "sofas, chairs, tables of every comfortable and commodious form ... liberally scattered throughout the room". By the mid 19th century such rooms played an essential role in country house entertaining and were equipped with games and scientific toys as well as books and portfolios of engravings with which to amuse guests on wet afternoons (Girouard, 1978).

The most instructive examples of public libraries from the 19th century can be grouped into three architectural developments from that era: the integration of industrial iron into structure as well as ornament in France, the creation of small municipal libraries with a domestic image in the United States, and the construction of monumental research libraries in period revival styles.

Designed by Henri Labrousse and constructed in 1842–50, the Bibliothèque Ste-Genevieve in Paris contains a ground-floor vestibule resembling a hypostyle hall; painted landscapes and busts of literary figures adorn the hall. Also on the lower floor are the book stacks, rare books and offices. On the upper floor a bold combination of masonry and iron, with cast-iron Ionic columns dividing the long room into two aisles, defines the reading room. The columns support open-web arches that in turn carry plaster vaults. Light enters through tall arched

Library, Cassiobury Park, Hertfordshire, after redecoration by James Wyatt, c.1800–15

windows, and gallery-level shelving is set between arch-supporting piers.

In the Bibliothèque Nationale in Paris, designed by Labrousse and constructed in 1858–68, the reading room occupies the center of an oval plan. Sixteen cast-iron columns, each 124 feet high, support nine porcelain-panelled domes. Three tiers of wall cases ringing the ellipse. Five storeys of book stacks rise under a double-membrane ceiling of iron and glass; the stack floors are assembled from transparent cast-iron plates. Connecting bridges link tiers of stacks. There is a ring of sixteen oculi in the outer wall, each centered over wall arches that spring from paired columns. This arrangement creates niches for four tiers of shelving.

Henry Hobson Richardson exerted great influence over the visual image of college and small or branch public libraries over half a century. In particular, he introduced and popularized a domestic image for an institution that represented an extension of the home, an image reinforced by the dominance of women staff members. In the Winn Memorial Library, Woburn, Massachusetts, constructed in 1876–79, Richardson created the prototype for the clearly articulated expression of

parts: exhibition area, or museum, reading room and book stacks. The entrance vestibule leads to a picture gallery. An octagonal museum sits at one end of the building, the gabled reading room occurs at the center, and a two-tier alcoved “library room,” or book stacks, comprises the last section, which contains a wooden vaulted ceiling and wooden support brackets.

In North Easton, Massachusetts, the Ames Memorial Library, constructed in 1877–79, although greatly simplified in relation to the Winn library, presents a similar set of elements. The stack wing features a wooden barrel vault, supported by two-tier shelf alcoves with Colonial Revival ornamentation. The reading room is sheathed in square-panelled wainscoting, and the stone fireplace is attributed to Stanford White. Incorporating a decorative medieval tradition, the fireplace relates to the designs of William Morris and the Arts and Crafts Movement. Massive engaged columns support a shallow mantel below two vases of pomegranate trees. Centered in the composition is a portrait medallion of Oakes Ames, the benefactor of the library.

Similar to but more compact than either the Winn or Ames

libraries, the Crane Memorial Library in Quincy, Massachusetts, constructed in 1880–83, centers on a hall separating the reading room from the book stacks. The decorative scheme includes finely reeded pilasters, with varied capital motifs. At the Billings Memorial Library of the University of Vermont in Burlington, constructed in 1883–86, the articulation of the museum is the greatest, with a distinct circular end designed to house the Marsh Collection. As in the Winn library, the reading room and hall occur in the center, and the alcoved book stacks comprise the other end.

Several fin-de-siècle examples in the United States illustrate the increasing size, volume and grandeur of the American library. In Washington, DC a 100-foot-diameter domed reading room dominates the design for the Library of Congress by Smithmeyer and Pelz, constructed in 1885–95. In plan, the reading room is lodged inside a hollow rectangle. Arches containing art glass spring from pilasters, and engaged columns resting on tall podia support the pendentives of the dome. McKim, Mead and White's Boston Public Library of 1887–95 is a hollow square in plan. Murals painted by Puvion de Chavannes enclose a grand stair that leads to the main reading room, Bates Hall, terminating in a coffered apse. The arcaded courtyard is derived from that at the Palazzo della Cancelleria in Rome. The six-storey book stacks occupy a U-shaped section of the building. Built in 1890–93, the Newberry Library in Chicago was designed by Henry Ives Cobb, and it adopted a plan suggested by its first librarian, William F. Poole. Harry Weese's 1981 addition accompanied a renovation of the original interior. The windowless addition provides an optimal controlled environment for the collection. Although long outgrown and no longer serving as a library, McKim, Mead and White's Low Library provides the focal point for the Columbia University campus. Built in 1893–1913, it is capped by a dome derived from the Pantheon, supported by four corner piers. Ionic colonnades support book stack galleries, and the reading room occupied the central space beneath the dome. The New York Public Library, designed by Carrere and Hastings, was built in 1897–1911. The entrance hall is white marble, decorated with festoons, and separates handsomely vaulted twin stairs. The misnamed third-floor rotunda is actually a barrel-vaulted hall; it substitutes finely carved wood for marble. Its murals illustrate the history of the word and were painted by Edward Lanning. The center of the plan is the limestone-faced catalog room; its simple Roman arches springing from piers, and the room is lodged in between two light atria. The main reading room is more elaborately carved limestone, and the 51-foot-high ceiling hovers above with paintings of sky and clouds.

Twentieth-century examples include the neo-Palladian Morgan Library in New York, experiments by International Style non-conformists Alvar Aalto and Louis I. Kahn, and more recently a return to the massive and enduring qualities of masonry selected by Thomas Beeby for the Chicago Public Library. Constructed in 1902–07, McKim, Mead and White's fireproof Morgan Library imported materials from Europe for J. Pierpont Morgan's study: red silk damask for the walls, a coffered ceiling and marble mantelpiece from Italy, and stained-glass fragments in the windows. The scale remains individual. The rotunda straddles the study, and in the east room, the main book area, the ceiling supports gilded mould-

ings and painted figures of Dante, Botticelli, Socrates and Christopher Columbus. Three levels of bronze and walnut bookshelves enclose the space, and a Flemish tapestry drapes the wall over the fireplace.

In several library designs, Alvar Aalto expressed his interest in undulating forms. At the Municipal Library in Viipuri, constructed in 1933–35, the wood battens of the lecture hall ceiling form a series of undulating curves. In addition, a glazed staircase wall leads to the sunken reading room. At the library in Seinäjoki, the gentle fan-shaped form of the reading room and book stacks rises above the service areas. Exterior louvers filter natural light.

The periphery of Louis I. Kahn's library for Phillips Exeter Academy in Exeter, New Hampshire, completed in 1972, encloses study alcoves, and a sliding wood shutter allows the reader to control the light at each window. The book stacks surround a central atrium, supported by concrete; monumental circles punctuate this skylit cube. Stairs are suppressed to the corners, and travertine sheathes the main stair up from the entrance.

In the Harold Washington Library Center, the competition-winning design for the Chicago Public Library constructed in 1988–91, Thomas Beeby appropriated the industrial loft building for a monumental civic building. Inside, a floor oculus in the entrance lobby opens to a floor medallion below illustrating the journey of Chicago pioneer Jean-Baptiste DuSable. On the upper floors, cross-vaulted reading alcoves alternate with double-height reading rooms. A cruciform skylit winter garden on the top floor contrasts an open-web steel and glass roof with a classical masonry and plaster vocabulary, recalling the hybrid structural nature of Labrouste's libraries. In the Chicago library, however, the grandest spaces, indicative of their creation in the latter part of the 20th century, are not for reading or study, but for circulation and special events.

Lights and Lighting

Man's approach to such a fundamental human requirement as lighting is closely bound up with the story of civilisation itself. After the initial domestication of the naked flame in pre-history there was little advance in the techniques or quantities of light available, except for religious purposes, and existence was largely governed by the hours of daylight. From the Renaissance, however, the gradual accumulation of wealth by the property-owning classes saw an increasing consumption of light both as a display of wealth (for it has always been expensive) and in order to extend the hours of work and recreation. Since the mid-19th century and the development of cheap fuels or power, lighting has become democratised and is universally available. It could be argued that as a result we have lost touch with nature and with its huge areas of aesthetic experience, since the subtleties of the passing seasons and the times of day mean much less today than in the past.

The presence of natural or daylight in secular interiors is largely determined by the treatment of windows. As domestic

Lighting: engraving of a festive scene showing the use of many candles, The Hague, 1660

houses became less defensive in character so windows multiplied and became larger. In the Middle Ages they were protected with shutters and then often covered with linen stretched over a lattice of wood and treated to make it translucent. In more prosperous houses windows came to be fitted with small panes of semi-translucent glass (depending on quality) set in leads often forming decorative geometrical shapes. By the late 16th century the extensive use of windows came to denote status and wealth as well as becoming essential to the new long galleries and rooms of parade. Hardwick Hall, Derbyshire is indeed "more glass than wall". Thus windows were to be frequent targets for taxation by predatory governments. By the later 17th century techniques had developed in the manufacture of glass and reflecting mirrors which enabled ever larger panes to be used, often in combination and with spectacular results: at Versailles the Galerie des Glaces consists essentially of a wall of mirror glass placed opposite the great rhythm of tall windows thus reflecting the gardens and landscape beyond. Further advances in the late 18th century included cast-iron glazing bars, used as early as 1789 in the floor-length windows of the Music Room at Heaton Hall, Manchester, while the top-lit Picture Gallery at Attingham Park, Shropshire, with its curved cast-iron ribs supporting the glazing, dates from 1807. At almost exactly this time "French windows" had begun to appear, breaking down the final barrier between the world of "nature" (represented by the park or garden) and that of "art" (represented by the house).

Thus the regulation of natural light has developed alongside the technology of windows – involving shutters, curtains and blinds with all their ramifications. The use of stained glass (often with heraldic features) remained unusual in domestic buildings until the very end of the 18th century, when coloured borders, armorials and figurative scenes might be found in strategically placed windows particularly in halls, stairways and libraries where a romantic sense of gloom might be appropriate. At Uppark, Sussex in 1813 and at the Brighton Pavilion in 1821 their respective stained-glass windows were especially lit from the exterior, the former by Argand lamps, the latter by gas.

It also seems that, since at least the 18th century, owners were mindful of lighting and its expense when deciding on the decoration of their interiors. Isaac Ware noted in 1746 that a room "which if wainscotted will take six candles to light it, will in stucco require eight, or if hung ten". Thus twenty years later at Wimpole Hall, Cambridgeshire, Philip Yorke and his wife discussed "the painting of the room they usually sit in ... my Lord was for having it ash or olive colour as being the cheaper or more durable. But my Lady objected that, though more expensive, the fashionable French white would be cheaper in the end" since it enabled the room to be lit by two instead of four candles.

For over a thousand years the principal form of lighting in Northern Europe was with candles either of wax or tallow, or, most simply of all, animal fat dipped in cloth. Southern Europe, where olive oil was plentiful, remained faithful to the oil lamp which had continued in uninterrupted use from Antiquity. Its basic shape was consistent with its function: a covered bowl, usually circular, to contain the oil, with a minimum of one aperture for a wick. This formula, like the candlestick, was capable of endless variation both in portable

and permanent forms. The great majority were obviously made from utilitarian earthenware, although some of the finest works of the High Renaissance are the deliberately faked Antique bronze lamps of Il Riccio of Padua. The 18th century in Italy saw the development of tall raisable multi-spouted vessels placed on baluster or figurative stems not unlike candlesticks. Candles were obviously also used in prosperous households in Mediterranean countries but it was probably the universal appeal of paraffin lamps in the mid-19th century which brought both Northern and Southern Europe into line with each other.

The use of candles and their receptacles is a vast subject that includes candlesticks to place on flat surfaces, sconces to hang on the wall, and chandeliers suspended from the ceiling. Overhead lighting in the form of hanging chandeliers probably derives from ecclesiastical prototypes. The production of brass or latten types was a speciality of the Low Countries and examples can be seen in Netherlandish paintings together with other brass candlesticks (van der Weyden's *Louvre Annunciation* has a six-branched chandelier apparently with a rise-and-fall mechanism). Such metalwork chandeliers obviously developed along with the stylistic trends of the times. By the early 18th century they had achieved several tiers of scrolling branches, but in Britain and its Colonies they were generally found only in large public rooms of houses such as great halls, galleries and ballrooms. Silver, ormolu and rock crystal examples were found in similar locations, and also in State Bedrooms, but only in the grandest interiors. Examples in carved wood, generally gilded, have rarely survived on account of their fragility. When enclosed behind glass panels these hanging branched lights should properly be described as lanterns: in England they are found in porches, halls and stairwells, either mounted to the walls like sconces, or hanging like chandeliers. In France they are often found in all the main reception rooms of a house.

The 18th century saw the development of the lead glass chandelier – one of the great achievements of the English – with its array of detachable and interchangeable parts and ornaments. In general a single example, or a pair, would be found in only the most prestigious room of a house. By the 1780s chandeliers had developed into the supremely elegant Neo-Classical compositions, often found en suite with table candelabra (or girandoles) of which William Parker was the most brilliant exponent. In the Regency period, and with the encouragement of the Prince, their designs became denser and more elaborate, while a return to 18th-century models began as early as the 1860s.

By this date however the lighting of domestic interiors had been revolutionised by a number of technical developments. On 15 March 1784 Ami Argand, a Swiss distiller, took out a patent in London for "a lamp or lantern producing neither smoke nor smell". He had made two discoveries: first, that if the wick of a traditional oil lamp were made hollow and enclosed between two tubes in such a way that oxygen could burn the oil vapour both on the inside and outside of the flame, the resulting light would be equal to ten or twelve tallow candles. Second, if a cylindrical glass chimney were placed above a lamp so as to increase the draught further, the brightness would be even greater.

The popularity of these Argand lamps was instantaneous.

Lighting by chandeliers in the Banqueting Room, Brighton Pavilion, 1826 (detail)

Lighting: interior and exterior of an Argand lamp, 1839

Within two years Sophie von La Roche described a shopping trip in London: "We finished tea at evening investigating Argand lamps of all descriptions" and proceeded to a shop in Bedford Square where they were all displayed "forming a really dazzling spectacle; every variety ... crystal, lacquer, and metal ones, silver and brass and every possible shade". It was their mechanism which dictated their design. An illustration in *The Penny Cyclopaedia* (1839) shows the classic type in section: A is the reservoir of oil which descends to the cistern B and along the pipe to C to the burner D which contains the wick placed between two tubes and immersed in oil. The wick rises a little above the tube at E. F is the glass chimney which is wider at the base in order to increase the draught upwards. It rests on a gallery G which can be turned to regulate the height of the wick. The wick is hollow and cylindrical and receives two currents of air – internally from the pierced work at I, and externally from the gallery at G. K is a characteristic early Victorian lamp shade and L the handle which controls the supply of oil. The type of oil used was from cole seed and was known as colza oil. It was thick and viscous and had to obey gravity – it was fed from a reservoir located above the burner.

Despite their success Argand lamps never entirely supplanted candle lighting. There seem to have been no particular rules or etiquette about their use in domestic interiors and it was probably the individual tastes of the owners which determined their use. Candles were also still used in drawing rooms, bedrooms and dining rooms, sometimes in combination with lamps placed on pedestals or hanging lamps which could be raised and lowered on a counterweight system supported with silk cords and with the pulleys disguised by tassels. Hanging lamps in bedrooms were usually found between the windows in order to throw light onto the dressing table. Passages, halls and libraries however lent themselves more readily to oil lighting: wall mounted "back lamps" in japanned tin frequently lined the passages of the service parts of the house, while grander bronze, gilt brass or ormolu lamps were developed for tables, mantelpieces or pedestals, often derived from famous classical prototypes. Portable reading lamps (or "student lamps") continued to be made right up to the World War I, often supplied with tapering tin shades, and often japanned in green. Hanging Argand lamps intended for great halls could be extremely impressive and several architects turned their hand to their design including Sir Jeffry Wyattville

and J.B. Papworth. Smaller models frequently have a cut glass bowl suspended below the burners. Examples of all of these can be seen at Belvoir Castle, Leicestershire, Stratfield Saye, Hampshire and Chatsworth, Derbyshire.

One of the chief drawbacks of Argand lamps was the inconvenient shadow cast by their reservoirs. This was overcome by the development of the Astral or Sinumbra lamp c.1810, where the oil was contained in a hollow ring which also acted as a support for the shade. The oil was fed to the central burner by tubes, and the lamps were surmounted by hemispherical or annular shades. The result was an even and diffused light so they were ideal for hanging or for placing on centre tables so characteristic of early 19th century interiors.

There were other problems associated with Argand lamps which inventors sought to overcome with new patented lamps. From 1794 the Carcel lamp attempted to raise the thick and viscous colza oil (incapable of capillary action) from a reservoir below the burner by a series of clockwork pumps; the Moderator lamp, patented in 1825, raised the oil by a spring-activated piston; a variation of this was the Meteor lamp which used a nut and screw mechanism on the outside of the lamp to control an internal plunger. The Solar lamp improved combustion by having a wick which passed through a hole in the centre of a cap or cone with air directed from a horizontal direction. Finally the "Liverpool Button", a metal cone which could be placed in the centre of any Argand burner, deflected the central draught onto the wick thereby greatly improving the light.

In the manufacture and retailing of all these different types of lamps there were various long-lived firms who took the lead, mainly in Birmingham, but often with showrooms in London: Messenger's, Hancock's, Smethurst's and Miller's. Decorative component parts were often imported from France. Cylindrical glass chimneys were always in clear glass, while glass shades and globes could be supplied with many variations – white or coloured (the latter considered a bit *nouveau* by 1840), translucent or clear, etched or plain. Suspended bell-shaped flame shades also appear to have been used above hanging lamps.

The increasing cost of oil, now including whale oil, led to various attempts to distil a new fluid from mineral sources. The breakthrough came in 1847 with James Young's process of refining paraffin (or kerosene) oil. The resulting lamps required flat wicks with good aeration, and various improvements culminated in 1865 with Hinks's Duplex burner with two wicks. Throughout the 1870s and 1880s patents for all kinds of new parts continued to be registered – Silber's producing an average of over two each year at this time. Argand lamps were quite easily converted for paraffin although colza oil continued to be used right up to the end of the century when the department store catalogues requested customers to state whether they required fittings for their lamps suitable for Colza, Mineral or Duplex oil.

Following the early developments of gas as a viable light source in the 1790s its immediate application was primarily for the illumination of factories and workplaces, a stigma from which it took a long time to recover. In 1802 its perfector, William Murdoch, used it to illuminate the exterior of Matthew Boulton's Soho works at Birmingham to celebrate the Peace of Amiens, while firms such as Gott & Sons of Leeds

IRONMONGERY DEPT.

QUEEN'S ROAD, W.

Lighting: electrical light fittings from Whiteley's catalogue, mid-19th century

were quick to take it up. Its advantages were the clearness and softness of the light itself, and the fact that it made no sparks and required no snuffing and little maintenance. It was also extremely cheap.

The use of gas lighting in upper- and middle-class domestic interiors, however, took a long time in coming, despite its promotion by the fashionable publisher and shop owner Rudolf Ackermann and the much-visited Sir Walter Scott who installed his own system at Abbotsford c.1823 which included a large hanging lustre and a number of fittings adapted from Argand lamps. Also despite this, there were criticisms about its smell and worries that its heat was harmful to interiors and decorations, so its use was often restricted to service areas, kitchens, back passages and stables. By the 1850s, however, gas was making inroads into grand houses where special gasworks were constructed: Windsor Castle, Chatsworth and Burghley went over to it, the latter even using branched and articulated fittings for the lighting of paintings. The commercial development of gas in towns (often under municipal control) and its improved distribution, brought it within the

reach of a great proportion of the population. Other technical improvements helped with its popularity: flexible rubber tubing enabled portable table lights to be developed, while water slide mechanisms allowed pendant branch gasoliers to be raised and lowered as required. The arrival of acetylene gas and the incandescent mantle in the early 1890s meant that gas continued to be a viable alternative to electricity well into the 20th century.

If gas had been considered a socially inferior form of lighting in its early years, the same was never true of early electricity in which the scientifically-minded upper classes took a considerable interest. In 1878 Lord Armstrong used arc lighting (in which a current was made to jump between two pencils of carbon) to illuminate the library at Craggside, Northumberland as well as other experiments with table lights, as did Lord Salisbury in the ballroom at Hatfield, Hertfordshire in 1880. The intensity of the light made it unsuitable for long-term domestic purposes, but the rapid development of the disposable incandescent bulb ensured that electrical lighting was taken up by those who could afford its

somewhat expensive installation. Its running costs were extremely low and, unlike gas, it produced no dirt or smell. Frequently it was used to illuminate a temporary or special event like the dinner given by Mrs. Meynell Ingram for the Duke and Duchess of York at Temple Newsam in 1894, nearly half a century before the house was connected to a mains supply. On this occasion clusters of naked bulbs were suspended from above the windows of the Picture Gallery, not only to give the room an animated brilliance, but also to provide a romantic effect when seen from the exterior. Curiously in its very early years no attempt seems to have been made to shade the light source although within a few years certain designs for standard lamps in particular could be classified as some of the greatest triumphs of the milliner's art. In the early 1890s Cragside was fully wired for electricity with fixtures supplied by Lea and Sons. Simple but pleasing designs in a subdued Arts and Crafts style by W.A.S. Benson became available commercially, while older equipment could be adapted for wiring with considerable ease. Thus by 1914 the whole gamut of lighting devices which had developed through the 19th century were in operation – oil lamps of every variety, gas and electricity.

Linnell, William c.1703–1763 and John 1729–1796

British cabinet-makers, carvers and upholsterers

From 1730 to 1795, the Linnell firm ranked as leading carvers, cabinet-makers, and upholsterers in 18th-century London, helping to create some of the most original and exceptional Chinoiserie, Rococo, and Neo-Classical British interiors. Established by William Linnell as a carving business, the enterprise quickly expanded into furniture design and production. By about 1750, John Linnell, eldest son of William, had become the firm's principal designer, producing innovative designs for seating and cabinet furniture, pier- and mirror-glasses, picture frames, sconces, chimneypieces, overmantels, cornices, and sides of rooms. The reputation of the Linnell firm, under John's direction, rivalled that of Thomas Chippendale, John Cobb and William Vile, and William Ince and John Mayhew. It is in the context of these large-scale suppliers of household goods that the Linnell firm must be considered. The Linnells competed for commissions from individual patrons and architects; the firm's furniture was made to order and sold from stock, and it offered a comprehensive service that included upholstery and maintenance. Originally established in Long Acre, the firm moved in 1754 to fashionable Berkeley Square. These premises, at the time of William's death in 1763, included a showroom, John's design studio, and three floors of workshops.

Keen insight into ever-changing tastes and styles, masterful skill and versatility, and professional associations with noted architects such as Henry Flitcroft, William Chambers, Lancelot "Capability" Brown, Robert Adam, John Vardy the Younger, and Henry Holland provided the Linnells with significant prominence and patronage for more than 60 years. The firm's origins as a carving business engendered in its designers a strong vocabulary in decorative motifs, winning for the company such distinguished clients as the Dukes of Bedford and Beaufort; the Earls of Carlisle, Coventry, March, Northampton, and Dartmouth; Sir Nathaniel Curzon (Lord Scarsdale); wealthy landowner William Drake; and the Hoare and Child banking families.

Throughout the 1730s and 1740s, William Linnell excelled as a designer and carver of decorative wall ornament made from soft wood, oak, and mahogany. Commissions for the Radcliffe Camera, Oxford's newest library (1745), for Sir

John Linnell: drawing for interior, chimneypiece and overmantel, c.1755

Richard Hoare (late 1730s–1740s), and for the 4th Duke of Bedford at Woburn Abbey and Oakley House (1749–1750s) represent a conventional use of Baroque and Palladian motifs, an early competence in incorporating Rococo motifs, and a mastery of the rich sculptural style of the early Georgian period. Such carving proficiency thrust William Linnell into the vanguard of British Chinoiserie craftsmen. In 1749, the 4th Duke of Bedford commissioned William Linnell to undertake the carved decoration and to supply the furniture, textile wall-hangings, and curtains for a Chinese pleasure house in the grounds of Woburn Abbey. The pavilion included: a “Gothick” roof, with gilt, carved corner and cornice ornament; two extravagant gilt dragons on the handrails; red-checked draw-up curtains; and painted “India” chairs. The

pavilion, among the first created in Britain, attracted much contemporary attention. Its success led to additional Chinese-style commissions from clients such as Mrs. Elizabeth Montagu (1752) and the Duke of Beaufort (1752). For this latter commission, the Linnell firm supplied a remarkable bedroom suite – japanned in black, gold, and red and including a pagoda-crowned bed, eight armchairs, two pairs of standing shelves, and a dressing commode – for Badminton House, Gloucestershire.

Trained as an artist at St. Martin’s Lane Academy, John Linnell was a key figure in the development of 18th-century British Neo-Classicism, initiating the use of marquetry decoration in the French style and an approach that, from a very early stage, involved designing with an harmonious, integrated inte-

rior in mind. By the late 1750s and before the Neo-Classical initiative, Linnell, unlike many of his London contemporaries, had mastered the asymmetry, fluidity, and capricious nature of the Rococo style. The exceptional rhythmic and sculptural appeal of his work, and his conventional repertoire of Rococo ornament, are apparent in the extravagant chimneypiece and overmantel for Lady Coventry's dressing room at Croome Court (1758). Linnell's *New Book of Ornaments* (1760), including ten exaggerated designs for coffee-pots, jugs, sugar-casters, and vases, best reveals his exuberant command of the Rococo style.

Around 1760, John Linnell distinguished himself as a leading, inventive designer by incorporating classicism into his work. This fascination with classical ornament eventually characterized most of his work, becoming increasingly severe and stylized. In 1761 to 1762, he designed a set of four marvelous sofas, mixing Rococo and classical motifs, for Kedleston Hall. The sumptuously-carved merfolk, tritons, and sea-nymphs evoke a sense of naval power, making reference to the patron Lord Scarsdale's military career and to Linnell's earlier unsuccessful design for George III's coronation coach. The central medallions depicting Juno and Iris, Bacchus and Mercury prefigure the exhaustive Neo-Classical movement in Britain.

Linnell gained much of his classical inspiration from working with James "Athenian" Stuart; however, it was Linnell's long-standing association with Robert Adam (which began with the Kedleston Hall commissions) that most profoundly influenced his Neo-Classical development. Linnell's sculptural formality gave way to Adamesque elegance, simplicity, and interior harmony. Adam's effect on Linnell is most pronounced in coordinated commissions from: William Drake for Shardeloes (1765); the 2nd Earl of Shelburne for Bowood House (1763) and Shelburne House (1767); the Duke of Northumberland for Syon House (1763) and Alnwick Castle (1765); and Robert Child for Osterley Park (1765) for which Linnell supplied various domestic pieces, including architectural mouldings and chimneypieces, Pembroke and card tables, and multiple sets of seating furniture.

Showing foresight and a remarkable sensitivity to the evolution of style, John Linnell pioneered, among British cabinet-makers, the use of marquetry decoration in the French style. Although incorporating such ornament as early as 1765, Linnell revolutionized the execution and sophistication of his marquetry decoration in 1767 when it is believed that he temporarily employed immigrant cabinet-makers Georges Haupt and Christopher Fuhrlohg, both Swedish-born and Paris-trained. At that time, a richer variety of marquetry panels and circular medallions with figure subjects appear in Linnell's designs, which characteristically included swags, geometric trellis patterns, naturalistic ornament, and straight veneered legs. Library furnishings commissioned by Robert Child for Osterley Park (c.1768) illustrate this unique combination of Franco-Swedish and English approaches to Neo-Classical furniture.

Later in his career, Linnell became increasingly concerned with architectural design, especially in relation to interiors. Commissions to redesign Uxbridge House (1789), in collaboration with John Vardy the Younger, and to assist Henry

Holland in the design of the Theatre Royal, Drury Lane (1791) illustrate a career shift. No longer employed simply to carry out a desired effect, Linnell became, with this work, an integral part of the team engaged to conceive an interior. During this period, Linnell's designs evolved into a standard form of late Neo-Classicism, incorporating a restrained use of marquetry or painted grotesque decoration with stylized motifs. A suite of bedroom furniture made for Castle Howard (c.1780) shows the delicacy and intricacy of his late Neo-Classical style and his integration of a variety of ornament – carved and gilt, marquetry, and painted. As an upholsterer, cabinet-maker, and designer, John Linnell anticipated and mastered changing styles in 18th-century British interior design. Fittingly, the increasing formality of his later work predicts the simplicity and severity of the Regency taste.

ELIZABETH A. FLEMING

William Linnell. Born in Hemel Hempstead, Hertfordshire, c.1703. Apprenticed to Michael Savage, member of the Joiner's Company, London, from 1717, and to John Townshend, 1719. Married Mary Butler, daughter of Samuel Butler, a leading coachmaker: 6 children; eldest son John. Operating independently as a carver of architectural elements and mouldings by 1729; as a cabinet-maker by mid-1740s; firm transferred to 28 Berkeley Square, 1754, where its operations included upholstery as well as cabinet-making and carving. Died in London, 1763, leaving stock valued at about £1,052 and his son, John, in sole charge.

John Linnell. Born in London, 1729, eldest son of William Linnell. Probably trained as a furniture-maker by his father; studied design and drawing at St. Martin's Lane Academy. Involved in the running of the family business by 1749; in sole charge from 1763; retired 1793. Died in London, 1796.

Selected Collections

A substantial collection of drawings relating to the Linnell family and firm, including a large number of original designs by John Linnell, are in the Prints and Drawings Department of the Victoria and Albert Museum. Additional documentation and manuscript material is held in the Scarsdale Archive, Kedleston Hall, Derbyshire, and the Lansdowne Archive, Bowood House, Wiltshire. Examples of the Linnells' furniture are preserved at Osterley Park, Middlesex, Kedleston Hall, and Bowood House; the suite of Chinoiserie furniture made for Badminton House, Gloucestershire, is now in the Victoria and Albert Museum.

Interiors

- 1749–51 Woburn Abbey, Bedfordshire (chimneypieces and carvings; decoration and furnishings for the Chinese Dairy; William Linnell): 4th Duke of Bedford
- 1752–55 Badminton House, Gloucestershire (furniture for the Chinese Bedroom; William Linnell): 4th Duke of Beaufort
- 1758–96 Kedleston Hall, Derbyshire (much furniture and hangings including seat furniture for the state drawing room; William and John Linnell): 1st Lord Scarsdale
- c.1760–84 Osterley Park, Middlesex (furniture with Robert Adam, and some chimneypieces; William and John Linnell): Francis and Robert Child
- 1762–72 Syon Park, Middlesex (carvings and furniture, with Robert Adam; John Linnell): 1st Duke of Northumberland
- 1763–96 Bowood House, Wiltshire (furniture, chimneypieces and carvings; John Linnell): 1st Marquess of Lansdowne
- 1765–68 Shardeloes, near Amersham, Buckinghamshire (furnishings and upholstery; John Linnell): William Drake
- 1765 Alnwick Castle, Northumberland (furniture; John Linnell with Robert Adam): 1st Duke of Northumberland

- 1773–81 Inveraray Castle, Argyll (drawing room furniture; John Linnell): 5th Duke of Argyll
 1789–93 Uxbridge House, London (furniture and chimneypieces; John Linnell): 1st Earl of Uxbridge

International Exhibition

"The Great Exhibition of the Works of Industry of All Nations, 1851" was the world's first international exhibition. It celebrated the commercial success of the Industrial Revolution and, as its title suggests, it provided an unprecedented international stage for manufactured goods and materials. Great Britain, as the initiator of the exhibition, was both the source of that revolution and its most developed economy, but by 1851 there was a pressing need to develop international markets for every part of that economy. In particular, expansion of production in the textiles, ceramics, metalware and furniture manufacturing industries demanded increasing access to the traditional markets of Europe.

Britain's lack of success in these markets had been first identified by the government as early as 1835. In 1836 a Select Committee reported recommending that the Government set up Schools of Design and Galleries for the public which would extend "a knowledge of the Arts and of the Principles of

Design among the people ... [for] the want of instruction among our industrious population ... [and] the absence of public and freely open galleries have all combined strongly to impress this conviction on the members of the committee". The Committee stated that, in their obsession for the machine and profit, manufacturers had abandoned the canon of beauty which traditionally comes with craft skills.

The Select Committee's recommendations were not without precedent. The Society of Arts was founded in 1754 "for the Encouragement of Arts, Manufacturers and Commerce". From 1842 under its President, Prince Albert (1819–61), it had done much to promote public awareness of good design in manufactures through a series of exhibitions that had increased steadily in popularity. In 1849 the Society sent Matthew Digby Wyatt (1820–77), the architect, to observe the Paris quinquennial exhibition. He was accompanied by a fellow committee member, Henry Cole (1808–82). Their enthusiasm for the quality of French design encouraged Prince Albert to propose that the Society's next exhibition, planned for 1851, should be international, thus allowing a direct comparison between British and foreign manufactures.

This far more ambitious plan was promoted by Cole in manufacturing centres throughout the British Isles and by Prince Albert in the City of London. As a result, by the start of 1850 interest was so great that the Government agreed that the organisation should be handled by a Royal Commission with Prince Albert at its head. As an international showcase for commerce it was estimated that a building of some 20 acres would be necessary to house goods from all over the world. Hyde Park was chosen as the only possible venue in London, and this decision was used as a weapon by the anti free-trade lobby in Parliament. The published plans for the building did nothing to allay public fears over the desecration of their finest park. Public opinion was finally won over only by the intervention of Joseph Paxton (1801–65) with his plan for a prefabricated modular building that could be readily dismantled. This 19-acre building of cast iron and glass was so successful that the name "The Crystal Palace" with which it was dubbed by the magazine *Punch*, has taken its place in history. Removed from Hyde Park after the exhibition, it was rebuilt on Sydenham Hill in 1854 where it remained as the People's Palace until 1936, when it burnt down. Today its grounds and a railway station are its only memorial.

This magical building and the sheer novelty of such an enormous exhibition containing 100,000 objects, drew more than 6 million people between 1 May and 11 October 1851. Its popularity was such that an unbiased evaluation of the quality and design of the domestic goods it contained by the journals and critics of the day proved rare. Instead, there was indiscriminate approval of the type of goods "lacking in the Principles of Design" that the Exhibition had been planned to combat. This was exacerbated by the fact that, unlike the previous Society of Arts exhibitions, no Exhibition Committee was set up to attempt to control the quality or design of the objects submitted for exhibition.

The building was divided giving Britain and the Colonies one half and the other half to foreign exhibitors. This allowed Britain to have separate Courts for some of the 30 different classes into which objects were divided. For example, in the British section a separate furniture court contained Class

London 1851: illustration showing Henri Fourdinois' prize-winning sideboard

XXVI "Decoration, Furniture and Upholstery, including Paperhangings, Papier-mâché and Japanned Goods", whereas France had just one court in which to exhibit furniture and all the other classes. Within the individual classes, medals were awarded for "Important novelty of invention or application, either in material or process of manufacture, or originality combined with great beauty of design".

In general, the critics of the day found more to praise in the foreign courts than in those of the British, but the *Art Journal*, in its specially illustrated catalogue, was swift to claim that this was unreasonable bias. "The *Art Journal* has displayed no want of courage in dealing with such subjects, or in protecting the interests of the great body of British exhibitors from the effects of that overstrained courtesy which seems to consider that the rights of hospitality demand sacrifices on the part of their English competitors, which are alike inconsistent with reason or with justice".

Despite claiming such "impartiality", the *Art Journal* often over-balanced into xenophobia. For instance it published only the briefest of comments on the well-designed French carpets of formalised flower bouquets against a plain background by the "distinguished firm of Messrs. Requillard, Roussel & Choqueil of Paris" saying simply "We introduce here two out of the numerous carpets contributed". In comparison, a British

carpet from Messrs. Turberville Smith & Co. of London is fulsomely praised. "It is very difficult to form anything like a correct notion of the richness and beauty of these fabrics when the colours are represented only by graduated shades of black, but the patterns, however delineated, speak for themselves. In [this] we have only the fernplant, one of the most graceful productions of the woods and hedgerows and as seen, worked out in this carpet in shades of the liveliest green, nothing can be more ornamental". The illustration depicts a carpet of naturalistic ferns of such compelling accuracy that the whole depth of the forest floor appears to be at your feet.

Nevertheless, the *Art Journal* itself was well aware of design problems related to historicism and naturalism. One of the essays they sponsored at the back of their publication was "The Exhibition as a Lesson in Taste" by Ralph Wornum, later Keeper of the National Gallery. He complained that "There is nothing new in the Exhibition in ornamental design; not a scheme not a detail that has not been treated over and over again in ages that are gone; that the taste of the producers generally is uneducated, and that in nearly all cases where that is not so, the influence of France is paramount in the European productions". In particular Wornum abhors Naturalism, saying that it is "using our imitations from nature as PRINCIPALS in design, instead of mere accessory decorations, substi-

tuting the ornament itself for the thing to be ornamented; ornament is essentially the accessory to, and not the substitute of the useful". This augments ideas already stated by A.W.N. Pugin, who, not without controversy, was asked to design the only courts in the Exhibition with a single theme.

The Medieval Court celebrated Pugin's true Gothicism and, rigidly overseen by him, had an integrity not seen in the unmonitored courts of the rest of the exhibition. However, it can be seen how unheeding contemporary commentators were to the ideas of Ralph Wornum and his fellow thinkers in the reaction to an armoire designed by Pugin, now in the Victoria and Albert Museum. The *Art Journal* baldly states "The cabinet here engraved is one of the most important pieces of furniture in the Medieval Court; it is executed by Mr Crace of London". By contrast an Austrian bed in the Gothic style, excessively carved, hung with fringed and tasselled velvet, its four posts and crown apparently topped with ostrich feathers, is described at length as "... most elaborately carved in locust-tree wood; it is decorated with a series of statuettes and bas-reliefs in the same material, typical of man's career, commencing with figures of Adam and Eve, on the footboard, and ending with scenes of his regeneration, at the head. An abundance of carved work of a fanciful kind is spread over its surface; the hangings are constructed of crimson damask and velvet of various depths of tint, fringed with gold lace, and the work altogether is as sumptuous as it is thoroughly artistic". This approbation is not confined to over-elaborated Gothic. A French sideboard by M. Fourdinois of Paris is described as "undoubtedly one of the most superb specimens of cabinet work to be seen in the Exhibition ... The style of the Renaissance has certainly never been more successfully carried out in an article of furniture ... it is beyond question one of the most meritorious articles of its class". The cabinet was awarded the Prize Medal for its class.

To the eyes of the contemporary visitor the exhibition supplied a veritable cornucopia of manufacturing successes, an affirmation that man in the 19th century was in complete control of his world.

The popular success of the exhibition provided a profit of £186,000 from total receipts of £522,000, most of it coming from the 4 million people who paid the one shilling entrance fee on Monday to Thursday. Entrance on Friday was two shillings and sixpence and on Saturday five shillings. Obviously Fridays and Saturdays were intended only for the wealthy at a period when a cabinet-maker in Spitalfields could be earning as little as 12 shillings per week.

The exhibition was so popular with the public, manufacturers and the press that it was decided that it should form the basis for a permanent display. The generally uncritical approval of decoration that bore little relation to an object's shape, its material or its function determined Prince Albert and Henry Cole to pursue a more specific and continuous education in taste. The result was an alliance between the Government and the Commissioners for the 1851 Exhibition. Eighty acres of land was purchased in South Kensington with the profits of the exhibition. On it was to be built a University of Science and Design, with related galleries and museums for both the students and the public. The whole enterprise was to be directed by Henry Cole. While never achieving the unity

proposed, the legacy of this scheme is the South Kensington complex of museums and colleges we know today.

London 1862

International Exhibition

The relative failure of British "art manufactures" at the Great Exhibition, recorded by Richard Redgrave in his *Supplementary Report on Design* (1852) and confirmed by a barely improved showing at the Paris Exposition Universelle of 1855, led to a reform of the Government Schools of Design under Henry Cole (1808-82) and the establishment of the South Kensington Museum in 1857. In the following year the Society of Arts, of which Cole was a prominent member, began a campaign to mount a second international exhibition in London, which would focus solely on progress in science and manufactures since 1851. Intended to be the first in a series of decennial celebrations, the exhibition was taken up under a Royal Commission but postponed for a year after the outbreak of the Franco-Austrian war in 1859.

Deciding on a 21.5-acre site adjoining the Royal Horticultural Society Gardens between Queen's Gate and Exhibition Road in South Kensington, the Commissioners appointed as architect the army engineer and Cole protégé Francis Fowke (1823-65). His final design for the building

included brick-built picture galleries with a 1200-foot façade fronting Cromwell Road – intended to remain permanently if the Exhibition made a profit – with a huge temporary exhibition space behind, of cast iron but with a wooden roof. Even with interior decoration by J.G. Crace (1809–89), there was no hope of recalling the splendour of the Crystal Palace (re-opened in 1854 at Sydenham), but Fowke gave his building the memorable feature of two vast glass domes at either end of the 800-foot central nave, at 160 feet in diameter the largest ever constructed in Britain.

Like its predecessor, the 1862 Exhibition opened on 1 May, with splendid ceremony albeit of a distinctly muted kind, owing to the death of Prince Albert in December 1861 and the subsequent absence of Queen Victoria. Despite the additional economic consequences of the American Civil War and, at home, the ensuing Lancashire Cotton Famine, the Exhibition nevertheless attracted 6,211,103 visitors over 171 days (a month longer than the Great Exhibition, which had 6,039,195). Lit by gas during the last weeks, it closed on 16 November. More rigorously conceived than the Great Exhibition, the 1862 International Exhibition allowed only items manufactured since 1851, thereby excluding much of the miscellaneous rubbish which had cluttered corners of the Crystal Palace. Only a few stray oddities crept in, including the ancient Egyptian jewellery of Aah-Hotep (shown in the Turkish Court) and the live frog said to have been found in a block of coal (this died, and was removed after sarcastic correspondence in the *Times*). Together, the 28,653 exhibitors (5,415 of them British) provided what *Fraser's Magazine*, echoing other commentators, described as “the largest encyclopaedia of industry ever found under one roof”. In spite of the apparent shortcomings of the building, the Exhibition was universally acknowledged to have achieved its aim.

It was in the Furniture Courts – especially the British, occupying much of the eastern half of the ground floor, and the French in the western – that improvements in taste were most noticeable. The chief accolades, from press and official Jury alike, went to Jackson and Graham (for a massive sideboard and other pieces, in a Louis XVI style far less cumbersome and overwrought than in 1851), Wright and Mansfield (notably for a bookcase incorporating Wedgwood medallions), Crace, Gillow, Holland and Trollope. In their improved workmanship and sophistication, embracing a gamut of historical styles ranging from Pompeian to Adam, these London cabinet-makers were seen to have stolen a march on their grander French rivals. In comparison, the enormous showpieces by Barbedienne, Grohé and Fourdinois (the latter sending a Renaissance-style carved chimneypiece previously exhibited in 1855) appeared heavy and old-fashioned. There was also much to admire in the British paper-hangings and carpets, manufacturers such as Jeffrey, Templeton, Scott Cuthbertson and Woollams having abandoned the worst excesses of vulgar ornament. In their designs, *Cassell's Illustrated Exhibitor* happily declared “we are no longer shocked by inconsistencies or repelled by anachronisms”, and even Christopher Dresser, in his rather dry and pedantic pamphlet on the *Development of Ornamental Art in the International Exhibition*, was prepared to admit that these goods were “of a high order”.

Good design was even more evident in the Medieval Court, within the British furniture display, arranged by the architect

William Burges (1827–81) under the auspices of the Ecclesiological Society. Paradoxically, the Gothic Revival then represented the vanguard of innovative design; in Burges's words: “In 1851 medievalism meant the late Mr. Pugin, but in 1862 it means all the principal and rising architects, and a very large proportion of the best manufacturers”. Church monuments and fittings by Scott, Street, Butterfield and Bentley mingled in the Medieval Court's fifty-foot-square space with what the *Clerical Journal* called “Domestic Gothic”, exemplified in the remarkable painted furniture by which the whole Exhibition is often remembered, thanks to the fortunate survival of so many important pieces. These include (all now in the Victoria and Albert Museum) the bookcase designed by Richard Norman Shaw and executed by James Forsyth; Burges's *Yatman* cabinet and *Wines and Beers* buffet; and the *King Rene's Honeymoon* cabinet made for the architect J.P. Seddon (who also showed an inlaid roll-top desk, now at the National Museum of Wales, Cardiff).

The Seddon cabinet, painted by Ford Madox Brown, Dante Gabriel Rossetti and Edward Burne-Jones, was among the exhibits of Morris, Marshall, Faulkner and Company, the firm of artist-craftsmen founded by William Morris in April 1861. Also exhibited were the *St. George* and *Backgammon Players* cabinets (now in the V & A and Metropolitan Museum of Art, New York, respectively); a chest decorated by Philip Webb (V & A); an Egyptian sofa designed by Rossetti (unlocated) and lesser items including two chairs and a screen. The firm's first public appearance was rewarded not only with two Prize Medals (for furniture and stained glass) but with enormous publicity. While some critics cavilled at its apparent incongruity – the *Building News* thought the Morris exhibits “no more adapted to the wants of living men, than medieval armour would be to modern warfare” – most offered praise for simplicity of design and imaginative decoration far removed from the general level of commercial manufacture.

More significantly for the future, Morris also showed serge and cotton hangings at 12 and 15 shillings a yard, and plain black-stained chairs at 25 or 30 shillings. These were rare examples within the Exhibition of affordable furnishings. Much was made at the time of new materials and developments in mechanical processes (many of which could be seen in the Machinery in Motion annexe) that reduced the cost of essential goods, while little was actually on display. The bentwood furniture by Thonet of Vienna was one hugely successful exception, and Heal's was one of the few British firms to show modestly-priced tables and chairs. 1862 saw the peak of the vogue for kamptulicon, a forerunner of linoleum made out of gutta-percha and ground cork, whose production was said to be 200,000 yards a year. Inexpensive carpets from Turkey and cotton rugs and mats from India were also in great demand: eight Prize Medals were awarded to the Government of India, the published *Jury Reports* solemnly commenting that “the Thugs and other criminals are extensively employed at Jubbulpore [prison], and the fabrics turned out are both good in quality and remarkably cheap”.

Much attention was focused on the small Japanese Court. Although some artefacts (mostly historical) had been shown at the Dublin Exhibition of 1853, this was the first significant public display of Japanese decorative art in the West. Assembled by the diligent British Consul, Rutherford Alcock,

the collection consisted chiefly of lacquer, paper, ceramics and bronzes; its modest position within the vast building was greatly enhanced by the highly-publicised presence of a delegation from Japan, in traditional dress complete with swords. The timelessness of Japanese craftsmanship was a revelation: Burges declared it “the real mediaeval court of the Exhibition”, while William Michael Rossetti pronounced that “about the very best fine art practised at the present day in any corner of the globe is the decorative art of the Japanese”. The contents of the Japanese Court were auctioned after the Exhibition closed, the bulk being bought by Farmer and Rogers, who opened an Oriental Warehouse in Regent Street, soon employing as manager the young Arthur Lasenby Liberty.

The Exhibition only just failed to break even, but without a surplus the building was doomed – including the massive picture galleries, which had housed the largest collection of paintings and sculpture ever seen in England – and it was demolished in 1864. Some of its materials were used to build the Alexandra Palace in north London, which still offers a reminder of the scale and appearance of the greatest British enterprise of its kind, one which impressed Fyodor Dostoyevsky as “a Biblical sight ... some prophecy out of the Apocalypse being fulfilled before your very eyes”.

Loos, Adolf 1870–1933

Czech/Austrian architect and designer

Born in Brünn, Moravia during the latter years of the Austro-Hungarian Empire, the architect Adolf Loos was the son of a stonemason. Although his architecture, interiors and theoretical writings were rooted in classicism and the 19th century, his spatially conceived designs and rational approach did much to inspire International Modernism. He aimed to bring American and British influences to Austro-Hungarian architecture and

design. He rejected ornamentation, denouncing its use in various influential writings. His interiors, and most notably his private houses, have attained iconic status and combine strict cubic forms and complex spatial relationships with rich colour and materials.

Loos studied building and technical studies at the Dresden Technical University. From 1893 to 1896 he spent three highly formative years in America, initiated by the wish to visit the World's Columbian Exposition in Chicago (1893). He took low-paid work in Chicago, Philadelphia, New York and St. Louis while becoming familiar with the Chicago School and the pioneering work of Louis Sullivan and Frank Lloyd Wright.

On his return to Vienna, Loos distanced himself from the activities of the Secession. He admired the achievements of American and British industry and engineering, and liked plain and polished surfaces of marble, brass and leather. He also admired the didactic writings of Ruskin, Morris and the works of the English Arts and Crafts Movement in architecture, furniture and interior design. Built-in furniture and simple leather-seated, English-style chairs and Richardsonian beams are apparent throughout his career.

The influence of Otto Wagner and an interest in eradicating superfluous ornament and decoration are apparent in the stark elegance of the Café Museum interior of 1899 – derided by critics as the “Café Nihilismus” and described as “a cold white stab at the heart of Art Nouveau.” A single-roomed interior with large bays, the café was a meeting place for the Viennese intelligentsia. The wide, light, vaulted space has a white ceiling with mahogany panelling on the lower walls and is furnished with simple, Thonet-style chairs and tables, designed by Loos and manufactured by Jacob and Josef Kohn. The interior is spartan, logical and practical but softened by the light curves of the bentwood furniture and the central, circular bar: a convivial, civilised space.

Loos's exemplary control of space and materials is revealed further in the Kärntner Bar of 1908. Within a tiny, intense space (3.50 x 7.00 x 3.50 metres) an enclosed world is carved out of a barroom interior which celebrates the New World. The bar was named Bar America but harks back to the Ancients, and the entrance portico carries a glass mosaic American flag above weighty, Skyros marble pilasters. A coffered ceiling of inverted yellow marble pyramids, combined with a chequered floor and black leather wall seating, and illuminated by diffused lighting, results in a perfect European bar in the metropolis of a great, but waning Empire. The Kärntner Bar is both cosmopolitan and introverted.

Loos's essay “Ornament und Verbrechen” (Ornament and Crime) of 1908 condemns decoration as degenerate and exploitative of craft labour. He associated lack of ornament with intellectual lucidity and cultural progress, and declared “Modern man with modern nerves, does not need ornamentation.”

In the new building for the Court Tailors, Goldman and Salatsch, 1909–11, on Vienna's Michaelerplatz (Loos had completed a shop interior for the firm in 1898), Loos revealed his faith in grand formalism and rational purity. The interior of the main entrance echoes the stark, monolithic exterior with its dramatic, green veined Cipolino columns and cladding and has massive rectangular columns of precious wood surrounding plate-glass cabinets. Inspired by American-style department

stores, Loos proclaimed: "On the ground floor and mezzanine where the shop has established itself, that is where modern life demands a modern solution." Gradually the monumental ground floor leads to the intimate, Anglo-Saxon, domestic scale of the reception room on the mezzanine gallery, passing through a complex arrangement of levels and rooms. A Viennese councillor named it "a horror of a house."

Writing in an article entitled "Architektur" of 1910, Loos declared that "The work of art is revolutionary, the house is conservative", but the private house that he designed for Lilly and Hugo Steiner (1910) was nothing if not controversial. The street front appears one-storeyed with a curved roof, the rear is an arrangement of flat-fronted, projecting planes. The interior is a disconcerting arrangement of complex spaces whose design prefigured a series of private houses that were partly open-plan and tiered, and that represented a far cry from the horizontally arranged, enclosed rooms of conventional house design. Loos was evolving his "plan of volumes" – *Raumplan* – which resulted in his famous split-level houses; the Moller House in Vienna and the Müller House outside Prague.

In 1918 Loos received Czechoslovakian citizenship. From 1920 to 1922 he was Chief Architect in the Municipal Housing Department of the City of Vienna. Although he was politically in tune with the city's social democratic government (1920–33) he nevertheless felt frustrated in his aim to apply his spatial theories to mass housing – "I really would have had something to show which is the disposition of the rooms for living in space, rather than on a plane – floor by floor – as has been done up to now. Through this invention, I could save mankind much labour and time in its evolution. For this is the great revolution in architecture: the freeing of plan in space!" It was not until 1931 in the workers' houses for the Viennese Werkbund that his utilitarian simplicity and ideas for social reform were put into practice; open galleries overlook living-cum-dining rooms and provide maximum exploitation of space.

Faced with opposition to his schemes, Loos relinquished his post in the Housing Department and emigrated to Paris in 1924. He quickly established links with the Parisian avant-garde, and, after an introduction by the composer Schoenberg, he designed a private house for the Romanian writer and Dadaist poet, Tristan Tzara, at Avenue Junot in Montmartre during 1925–26. The façade appears to be a rectangle of two pierced cubes, concealing the secrets of an interior where split-levels within floors and rooms of interlocking shapes housed African masks and figurines. In the living room further ambiguities are encouraged by the reflecting play of mirrors. Despite this house's radical statement, no further commissions from the Parisian circle were forthcoming. In 1927 Loos left Paris for Vienna.

It is the two private houses, Moller House, Vienna of 1927–28 and Müller House, Prague of 1929–30, which declare his maturity and mark the culmination of his earlier theories and design. In the former house, built for Hans Moller, a textile industrialist, the floor spaces of the cubic building interconnect. The dining room and music room are linked by a sliding door and the raised music room can only be reached by folding steps. Built-in furniture predominates; Thonet chairs and tables are the exception. Okume plywood facings and Travertine stone line the walls and planes.

The Müller house was built for Dr. Frantisek Müller, proprietor of Kapsa-Müller, a major construction company. Cubic, like the Moller House, but built high above Prague, this house has a plain, screen-like façade, concealing an intriguing and remarkable spatial plan and an interior replete with sumptuous materials within its white-rendered shell. Loos wrote that "The house should be discreet to the outside, its entire richness should be disclosed on the inside." A vivid play of colours, finishes and materials including beautifully veined, green Cipollino de Sion marble, Silesian syenite granite, pale satinwood, dark mahogany, Persian rugs, parquet flooring, maiolica or red-brick fireplaces, leather upholstery, yellow curtains and purpose-built furnishings and light-fittings confirm his view that "rich materials and good workmanship should not only be considered as making up for lack of decoration but as far surpassing it in sumptuousness." And, in his *Raumplan* Loos has played a majestic chess-game in space. Rooms are distinguished one from another by types of wood; they are also separated by steps or linked by an internal window. Views of Prague connect the inside and the outside as does the opening on the roof terrace wall which frames a view of St. Vitus Cathedral. The Müller House is a triumph of spatial play, strict sculptural form and material glory. (There were eleven applications for planning permission before its design was accepted by the authorities.)

Nearing the end of his life, in 1931, Loos designed a plain, cut-crystal glass table set for Lobmeyr, Vienna, which is still in production, but on the whole he challenged the *Gesamtkunstwerk* notion that furnishings should be specially designed by architects for each interior. Thus in many of his own interiors he used Thonet-style bentwood and unostentatious, traditional English chairs reproduced by his furniture maker, Josef Veillich. These were often in the Queen Anne, Hepplewhite, Chippendale and rural Windsor styles and many were fitted with comfortable, plain leather seats. Loos was also fond of an Egyptian *Thebes* stool design (similar to a Liberty model) which he placed in his earliest interiors, such as the Villa Karma of 1904–06.

Loos was greatly revered not only by his pupils, the architects Richard Neutra and R.M. Schindler, but also by the Modernist movement as a whole. More recently his admirers have included Postmodernists such as Robert Venturi and Aldo Rossi who have declared Loos's mastery of interior space and form to be their inspiration.

Biography

Born in Brünn (now Brno, Czech Republic), 10 December 1870, the son of a stonemason. Studied architecture at the Technical University of Dresden, 1889–93. Married 1) Lisa Obertimpfer, 1902 (divorced 1904); 2) Elsie Altmann, 1918 (divorced 1926); 3) Claire Beck, 1929 (separated 1930). Visited the US, 1893–96. Active in private architectural practice in Vienna, 1897–1922; appointed Chief Architect, Municipal Housing Department, Vienna, 1920. Lived and worked in Paris, 1922–27. Returned to practise architecture in Vienna, 1927–33. Worked as a journalist for *Neue Freie Presse*, 1897–1900, and published numerous articles on architecture and design. Founder-director, Free School of Architecture, Vienna. Died in Kalksburg, near Vienna, 23 August 1933.

Selected Works

The Adolf Loos Archive, containing drawings and documents, is housed in Graphische Sammlung Albertina, Vienna.

Interiors

- 1898 Goldman and Salatsch Shop, Vienna (interiors)
- 1899 Café Museum, Vienna (interiors and some furniture)
- 1904–06 Villa Karma, near Vevey, Switzerland (building and interiors)
- 1907–08 Kärtner (American) Bar, Vienna (interiors and some furniture)
- 1909–11 Goldman and Salatsch Store (Looshaus), Vienna (building and interiors)
- 1909–13 Knize Store, Vienna (building and interiors)
- 1910 Steiner House, Vienna (building and interiors)
- 1912 Scheu House, Vienna (building and interiors)
- 1913 Bellatz Apartment, Vienna (interiors)
- 1915–16 Duschnitz House, Vienna (alterations and interiors)
- 1926–27 Tristan Tzara House, Paris (building and interiors)
- 1927–28 Moller House, Vienna (building and interiors)
- 1929 Josef Vogl Apartment, Plzen (interiors)
- 1930 Müller House, Prague (building and interiors)
- 1931 Semi-detached houses, Werkbund Exhibition, Vienna (buildings and interiors)

Loos began designing furniture from c.1890; he also designed woodwork, metalwork and glass.

Loudon, John Claudius 1783–1843

Scottish architect, landscape gardener and theorist

The son of a Scottish farmer, John Claudius Loudon was born at Cambuslang, Lanarkshire. He was apprenticed to a nurseryman near Edinburgh before he was in his teens, but he studied part-time at the University of Edinburgh and acquired a great deal of information on a wide range of topics. When he was twenty he moved to London and set up as a landscape gardener with such success that he made a fortune of £15,000 in eight years. He went on an adventurous tour to Sweden, Prussia, Poland and Russia, during which he made many observations which he was able to draw on in later publications. But imprudent financial speculations prevented other foreign tours on this scale, and Loudon settled down to a hard-working life as a landscape gardener and writer. Increasingly bad health and the amputation of his right arm made him rely more on authorship, and his output was prodigious. He established magazines on gardening and on architecture, and produced many books, of which the best known are the *Suburban Gardener and Villa Companion* (1836–38) and the *Encyclopaedia of Cottage, Farm and Villa Architecture* (1832–33). The latter, which started to appear in monthly parts, became in the end a bulky book containing well over 1,000 pages in small type, and over 2,000 woodcut illustrations. It went through several editions, with supplements, until 1869, and there was an American edition in 1883.

The *Encyclopaedia* is crucial to understanding middle-class taste of the 1830s; it exerted a considerable influence on popular domestic taste, not only in England but across the Atlantic and in the Antipodes. Unlike 18th-century pattern books, Loudon's book was not addressed solely to the well-to-do; it contained sections on cottages and farmhouses, as well as middle-class villas, and in each case the interiors were considered as well as the exteriors. By the term “cottager” he included “not only labourers, mechanics and country tradesmen, but small farmers ... gardeners, bailiffs, land stewards

and other upper servants of gentlemen's estates". He advocated that the rooms of these cottages should have cornices, if only the simplest which could be formed "by filling up the angle by a straight hypotenuse line", and he illustrates thirty sections that might be used, increasing in elaboration. Plaster ceiling ornaments consisting of "but a rose or other flower, in plaster or composition, might be introduced ... in the centre of the ceiling of a cottage parlour". One could be bought for as little as seven shillings. Lines painted on the walls might be used as simulated panelling, or plaster or papier-mâché mouldings could be stuck on the wall for a more realistic effect. In limewashing or distempering, "the ceiling should be of a lighter colour than the walls" and the most common colours for the latter are shades of yellow, red, green or grey, while the cornice should form a separation between the two and be "some shade of yellow, grey or brownish red". Graining is recommended for all the woodwork, and the model should be the prevailing timber of the district. However, if the cottage is built in some exotic style, such as Indian or Chinese, "the bamboo and other tropical woods, should predominate". An alternative treatment of the walls is to stencil them, or to use wallpaper. If the latter, Loudon recommends that the lobby and staircase might have ones marked with lines in imitation of stone pointing, but he also mentions trellis-work and, when appropriate because of the cottage's style, Gothic papers. There is much good advice about the choice of furniture, much of which was evidently intended to be grained or painted, and he includes detailed recipes for simulating mahogany, rosewood and ebony. There are designs for Gothic and Grecian chairs, and since "a sofa is a piece of furniture which affords a great source of comfort to the possessor ... the cottager ought to have one as well as the rich man. Let him strive to obtain it, for no parlour is completely furnished without one; and he will certainly succeed".

The rich man, who presumably could have a sofa without striving for it, had a much greater choice of interior decoration, although it should be related to the style of his villa itself since, wrote Loudon, "it cannot be superfluous to remind the reader, and especially the young architect, of the necessity of the building and finishing of a house being under the control of the same mind". With reference to colour, he quotes from David Hay's *Laws of Harmonious Colouring*: "The colouring of rooms should be an echo to their uses. The colour of a library ought to be comparatively severe; that of a dining room grave; and that of a drawing room gay. Light colours are most suitable for bedrooms. The colouring of all rooms depends so much on the colour of the furniture, and this ought always to be known to the decorator, before he determines his system of composition." It also depends on the style of the furniture, and Loudon reduced those available to four: "the Grecian or modern style, which is by far the most prevalent; the Gothic or perpendicular style, which imitates the lines and angles of the Tudor Gothic Architecture; the Elizabethan style, which combines the Gothic with the Roman or Italian manner; and the style of the age of Louis XIV or the florid Italian, which is characterised by curved lines and excess of curvilinear ornaments ... the demand [for the latter two] is rather on the increase than otherwise".

Each of these main divisions of style is dealt with in detail, except for the last, and each is illustrated with a general view

of a room in that style, for the most part sparsely furnished. The pages devoted to the Grecian or modern furniture occupy far more space than the others; Loudon excuses the relatively few Gothic examples because "they are more expensive to execute ... partly from the greater quality of work in them, but chiefly because modern workmen are unaccustomed to this kind of workmanship".

Evidently he had little liking for the Elizabethan style: "the present taste [for it] is more that of an antiquary, or of a collector of curiosities, than that of a man of cultivated mind". He also took the opportunity to comment on the current taste for collecting old oak furniture by referring to the "abundant remains of every kind of Elizabethan furniture to be purchased of collectors. These, when in fragments, are put together, and made up into every article of furniture now in use; and, as London has a direct and cheap communication with every part of the world by sea, the American citizen or the Australian merchant, who wishes to indulge in this taste, may do it with the greatest ease".

Loudon's *Suburban Gardener and Villa Companion* (1838) included many illustrations of his own model house, which was built in London in 1824 and which contained many novel and ingenious features. He exercised a strong influence on the American architectural theorist, Andrew Jackson Downing (1815–52) whose widely-read *Cottage Residences* (1842) and *The Architecture of Country Houses* (1850) borrowed heavily from Loudon's books.

DEREK LINSTRUM

Biography

Born in Cambuslang, Lanarkshire, in 1783, the son of a farmer. Studied part-time at the University of Edinburgh; apprenticed to a landscape gardener at Easter Daisy from 1798. Married the writer Jane Webb (1807–58), 1831. Moved to London, 1803, and pursued a successful career as a landscape gardener. Travelled to Sweden, Prussia, Poland and Russia, 1817. A prolific writer, he published numerous books and articles on gardening and architecture including the hugely influential *Encyclopaedia of Cottage, Farm and Villa Architecture and Furniture* (1833). Active member of many societies and associations. Died in December 1843.

Ludwig II 1845–1886

King of Bavaria

Ludwig II was one of the most important architectural patrons of the second half of the 19th century. Born in 1845, he succeeded his father Maximilian II as King of Bavaria in 1864. He took some part in affairs of state during the first years of his reign but from about 1870 he retreated into seclusion to concentrate upon his building projects. His huge extravagance and increasing eccentricity led to his being officially pronounced insane in 1886. A few days later he drowned in mysterious circumstances. Politically, his legacy was not surprisingly one of conflict and confusion, but artistically his three castles – Neuschwanstein, Linderhof and Herrenchiemsee – represent supreme achievements in 19th-century historicism. They also represent the three styles most favoured by European revivalist designers, namely Gothic, French Baroque, and Rococo, and perhaps even more remarkably, they survive today just as Ludwig left them with almost all their furnishings and decoration intact.

A mania for building had broken out several times in the long history of the Wittelsbachs who held power in Bavaria for more than a thousand years. The young Ludwig was brought up in the Bavarian Alps in the Biedermeier Gothic castle of Hohenschwangau, and his favourite pastime was reputedly playing with bricks; but the more mature passion for real building was linked to his newly discovered admiration for the operas of Wagner. His first commission was given to Michael Echter to decorate his apartments in the Munich Residenz with scenes from the Nibelungenlied. Wagner's music and the romantic German legends were an important inspiration in the young king's life. Another hugely significant influence took root during his visit to Paris in 1867 when he took the opportunity to view Versailles and Pierrefonds. Both interiors were to provide important models for his future plans: Versailles inspired Herrenchiemsee and Linderhof while Pierrefonds influenced the development of Neuschwanstein. Ludwig's identification with Louis XIV dates from this period, as does his fascination with the romantic medieval castle that Viollet-le-Duc had rebuilt and decorated for Napoleon III.

The initial impetus for Ludwig's first building project, Neuschwanstein, was a visit to Wartburg where he admired the Minstrels' Hall. With Pierrefonds in mind, he resolved to restore the old castle at Neuschwanstein and appointed Eduard Riedel to build a romantic pile in the Romanesque style. The decoration of his Minstrels' Gallery went through some changes as Ludwig's ideas altered. So did his concept of the

Throne Room, which became a mystic representation of the Holy Grail in which to meditate on the divinity of kingship. Two storeys high, it is Imperial Byzantine in style. The vault is blue and studded with stars, and lapis lazuli, porphyry and gold are the principal colours. Nature is represented by plants and animals in the mosaic floor, and the divinity of kingship is stressed in the figure of Christ in Glory in the semi-dome above the glittering gold apse, and the flanking figures of the six Holy Kings.

Symbolism is everywhere in this rich room. The staircase leading to it has a central column in the form of a palm tree fading out into a blue vault with gold stars, and there are painted imitations of hangings between the Romanesque columns. The study, dining room and bedroom are dark and heavy, with painted scenes from *Tannhauser* and *Tristan und Isolde*. The bed is a tomb-like structure with a lavishly pinnacled canopy. Attached to the study is a grotto that could be lit up in various colours, the first use of an idea that was developed in Ludwig's next building, Linderhof, where there is a full-scale grotto with water and lighting effects.

In his other two major building projects, Ludwig turned from the world of German legends, medieval chivalry, Wagner's operas and romanticism, to his other obsession, the idea of sovereignty inspired by his admiration for Louis XIV. At Linderhof the first intention was simply to add a room to an old hunting lodge, but by 1870 this had grown into a new suite of apartments, and by 1874 it had been decided to take down the old building and build yet another suite, facing the whole with a uniform Baroque exterior designed by Georg Dollmann. Inside, the decoration is a tribute to Ludwig's ideal monarch, even if at times the character is more Napoleon III than Louis XIV. The walls of the smaller rooms are covered with silk, yellow, mauve, blue and rose, and the overdoors in gilded Rococo frames and the ceiling panels are filled with painted deities and allegories. The walls are framed in gilded Rococo scrolls, and the Rose Salon has portraits of 18th-century ancestors. There is a mirrored room, perhaps inspired by the one decorated by François Cuvillies in the Munich Residenz. But the most splendid room is Ludwig's bedroom, with its ornate gold and blue velvet draped bed in a recess, a setting for a grand levée in the Louis XIV manner, although there was no court at Linderhof to participate in the ceremony. In the vestibule Ludwig placed a statue of the Sun King as presiding deity under a ceiling decorated with a golden sun and an arrogant motto.

Ironically, Bavaria lost its independence in 1871 when Bismarck persuaded Ludwig, as the most important German prince, to lead the others in inviting William, King of Prussia, to accept the Imperial crown of a united German Empire. The declaration was made at Versailles in the Hall of Mirrors. The memory of Louis XIV's great palace had never left Ludwig. Within a year of his first visit his architect was making plans based on the central section only of Versailles. The two main rooms in this first essay, for which there does not appear to have been a site, were a Hall of Mirrors and a State Bedchamber, a scheme that once again returned to the traditional idea of the king's bedroom as the heart of a palace, a custom superseded in most European palaces after Napoleon's introduction of the Throne Room as the centre of power. It

Ludwig II: Porcelain Room, Herrenchiemsee, 1878–86

seems as if Ludwig's intention was to build a monument to Louis XIV, and gradually the idea grew on the drawing board.

In 1873 Ludwig bought an island in the largest Bavarian lake, the Chiemsee, on which to build this most ambitious of his projects – Herrenchiemsee – which by then had reached the size of Versailles on paper. In the event only the central section and one wing (later removed) were built. What interested Ludwig principally was to have the Hall of Mirrors and the State Bedchamber, and the large numbers of craftsmen employed had to concentrate on these. As at Linderhof, short cuts were taken; for example, many of the apparent Gobelin tapestries are in fact painted canvas. The staircase in the south wing is virtually a copy of the Ambassadors' Stair at Versailles; this had been demolished in 1752, and so the Bavarian version was built from engravings. The staircase leads to the Guard Room and the Antechamber; then comes the lavishly furnished and gilded State Bedchamber, the central room on plan and symbolically. The painting on the ceiling shows Apollo with Louis XIV's features, and large golden suns shine out from the red carpet.

The Hall of Mirrors closely resembles the French original, including 47 banquettes, 12 tabourets, 52 candelabra, 8 orange trees in tubs, 4 vases, 16 busts of classical emperors and 33 great glittering chandeliers in three rows. The ceiling was copied from that at Versailles after Ludwig had sent a team of painters to study it. The creator of all this splendour occupied it for only nine days.

Ludwig's passion for French Baroque and Rococo decoration dominated his fanciful projects and helped promote a neo-Rococo style. Eugen Drollinger, Franz Seitz and Christian Jank were responsible under Georg Dollmann's direction for all this revival of Franco-Bavarian Rococo, and their work ensured there were many craftsmen who had become accustomed to working in the style of their 18th-century predecessors. A significant change of attitude towards the Baroque and Rococo styles became apparent in the 1880s, and one important public building which undoubtedly was influenced by Ludwig's example was Friedrich von Thiersch's Justizpalast in Munich. But by the time it was completed in 1897 Ludwig's strange life had ended.

Biography

Born in Munich, 25 August 1845, the son of Maximilian II of Bavaria. Became Crown Prince, 1848; succeeded Maximilian II as King of Bavaria, 1864. Visited Paris, 1867, and again in 1874. Began building Neuschwanstein, 1869; built Linderhof from 1870, and Herrenchiemsee from 1878. Declared insane, 8 June 1886, and Prince Luitpold appointed Regent, 10 June 1886. Died 13 June 1886.

Selected Works

A large collection of drawings and documents relating to Ludwig and his architectural projects is held by the Ludwig II Museum, under the direction of the Bayerische Verwaltung der Staatlichen Schlösser, Gärten und Seen, Munich.

Interiors (commissioned)

- 1865–69 Residenz, Munich (apartments designed by Franz Seitz)
- 1869–86 Neuschwanstein (designers included Christian Jank, Peter Herwegen, Michael Welter and Julius Hoffmann)

- 1870–84 Linderhof (designed by Franz Seitz, Christian Jank, Georg Dollmann, Adolph Seder, Eugen Drollinger, Franz Stulberger, Franz Brochier and Franz Widmann)
- 1878–86 Herrenchiemsee (designed by Georg Dollmann and Julius Hoffmann)

Lutyens, Edwin 1869–1944

British architect and designer

Virtually dismissed by Modernist architectural historians, Edwin Lutyens is viewed today as perhaps the most noteworthy British architect since Sir Christopher Wren. Rediscovered in a Postmodern era eager to reinstate a richer architectural language after generations of soulless, prosaic Modernist abstraction, Lutyens is now viewed as a poet of architectural form – a picturesque traditionalist who designed buildings imbued with a sensitivity to place, respect for materials and traditional methods of building, and expressive in their varied architectural languages, from vernacular to classical. His collaborations with Gertrude Jekyll created assured embodiments of the traditional image of the olde English house and garden, and his Viceroy's House in New Delhi remains one of the most monumental works of the 20th century. His plans could be sophisticated or so simple as to seem undesigned; his forms could be playful and full of delight or powerful and emotionally moving; his details could be witty and eccentric or so critically a part of the building craft as to present themselves as quintessential constructional elements vital to the life of the architecture. As an architect he was eloquent, colorful, plain-spoken, homespun, provincial, and worldly, and while he mastered both the art and craft of his profession, he characteristically referred to architecture as a game.

Lutyens viewed the design of architectural environments as far more than merely the rendering of façades, elevations, and plan layouts. His wider view embraced garden design,

Lutyens: hall, Deanery Garden, Sonning, 1899–1902

urban design, interior design, and the design of decorative arts and furnishings. He is known by gardeners for his “Lutyens bench” and for numerous gardens laid out with Jekyll plantings; he is known by urban designers for his ensemble of buildings at Hampstead Garden Suburb and his notable plan for the new capital of the Indian Empire at New Delhi; and he is known by architectural and decorative design historians for his deceptively sophisticated architecture (from war memorials to country houses), for his craftsmanship and concern for materials, and for his furniture designs and interior details.

Lutyens’s interiors and furnishings reinforced his commitment to a design integrity based on natural building and craftsmanship. Like other “craft architects” and artists of the Arts and Crafts Movement, Lutyens was a member of the Art-Workers’ Guild (founded in London, 1884), and he designed furniture almost from the start of his architectural practice. His models were often vernacular furniture forms, but he especially admired and referenced 17th-century furnishings, from Stuart to William and Mary. He designed rush-seated ladder-back chairs for Little Thakeham in Sussex (1902); a bed, baluster-legged dressing table, and ladder-back chair for Edward Hudson at Deanery Garden (Sonning, Berkshire, 1899–1902); and huge, sturdy, and primitive kitchen furniture of unstained oak at Castle Drogo (Drewsteignton, Devon, 1910–32).

This preference for vernacular forms and 17th-century joinery pieces emerged from several sources. He had been briefly apprenticed to the architectural firm of George and Peto, whose houses employed Jacobean and 17th-century forms, and whose furniture designs were often based on late 16th and 17th century sources. Gertrude Jekyll, who commissioned Lutyens in 1896 to build her home at Munstead Wood, Surrey, furnished the house with her collection of country furniture. And Edward Hudson, editor of *Country Life* from 1897, and early promoter as well as patron of Lutyens, was an antique collector who frequently furnished his houses with 17th-century pieces – less urbane than Chippendale or Hepplewhite and comfortable in the country settings.

The great hall interior (perhaps Lutyens’s finest medieval hall evocation) and the first floor gallery at Hudson’s Deanery Garden reflected these influences. Deanery Garden’s gallery, based on a similar space at Munstead Wood, contained Jacobean-style ladder-back and spool-back rush-seated side chairs, with plain or lathe-turned stretchers and legs, as well as a bench and side table of similar joinery and source. Farmhouse prototypes for furniture in Deanery Garden’s interiors was raised to a greater sophistication by the more ornately carved Jacobean armchairs and spiral twist table legs in the great hall. Lutyens created a sequence of rooms at

Deanery Garden in which the interior design and architecture reinforced a common aesthetic of natural, vernacular domesticity.

Lindisfarne Castle, Northumberland, which Lutyens restored for Hudson in 1903, was genuinely medieval and was thus furnished with primitive pieces reflective of the almost stoic interiors of the ruin. The remote site of the derelict Lambay Castle (1905), on an island off the coast of County Dublin, Ireland, encouraged a similarly primitive aesthetic. Lambay Castle's whitewashed walls and duck-egg blue painted oak floors, and Lindisfarne's spartan interiors were both austere and natural, quintessentially craft-inspired environments for country living in reclaimed interiors of a ruined past.
